FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

Farm Prospects in 1950

By H. L. COSLINE

LET'S TAKE the bad angles of the farm outlook first so we can close on an optimistic note. Economists agree that farm income in 1950 will be less than it was in 1949—probably about 10% less. The editors of *American Agriculturist* are inclined to feel that livestock farmers are in a little better position than cash crop or fruit farmers. Farmers' costs will be down much less than prices, if at all. Some costs—for example, feed—will be lower than the peak, and farm labor may cost a little less. Other costs will be as high or higher; for example, taxes.

At the moment, prices that farmers get and pay are in balance. Study the graph below. The average parity figure on all farm products is 100, meaning that for a given volume of what farmers produce, they can buy as much as they could back in 1910-14. Compared to the years before 1941, the outlook for 1950 is rosy; compared to the peak years during the war it is gloomy. The "net" is that good farmers who plan their programs carefully will make money in 1950. In fact, farmers would be happy if they were assured that they would never have a year worse than 1950 is expected to be. What they fear, of course, is that their position will continue to deteriorate. This will happen if the prices they get continue to fall faster than the prices they pay for supplies.

There is more optimism about business conditions at the start of 1950 than there was a year ago. There was considerable fear then that we might be heading into a depression. There was a slump, followed by an upturn, and it appears now that consumers will have a good volume of spending power. This optimism is tempered in some quarters by a belief that prosperity built on government handouts and deficit spending cannot last forever.

MILK

In spite of dry weather, milk production in New York State in 1949 was about 10% high-

er than in 1948, and the increase in the whole Northeast was comparable. Consumption in New York City did not change much compared to 1948, but in both years the consumers drank less fluid milk than they did in the peak year, 1946. As a result of these factors, the farm price of milk at the end of 1949 was about \$1.25 per cwt. lower than it was a year ago. The "Milk for Health" program to increase consumption will pay dividends. The more milk consumers drink, the better returns farmers will get.

Compared to a drop of about 20% in the price of milk, the production cost decreased only 5%. In New York City a decrease of 44 cents a cwt. in the Class I price went into effect January 1, 1950, and will result in a decrease of over one million dollars in the January income of dairymen in the milk shed.

Dairy farm income in 1950 will be less favorable than in the last 3 years, but still will be better than it was in the years preceding the war.

POULTRY AND EGGS

Right now poultrymen own about 4% more laying hens than they did a year ago. Egg production is expected to be higher than it was a year ago for the first 6 to 9 months of

the year, and then it is expected to drop below corresponding months of 1949. Government price supports on eggs (which only indirectly affect the Northeast) will be lower than they were in 1949.

As a result of all these factors, fewer laying pullets are likely to be raised this year; and while feed costs are down compared to the peak, the total net income of poultrymen is likely to be somewhat less than it was a year ago.

On a long-time basis, hens will continue to pay on good northeastern farms. It is not a year for big expansion or severe contraction.

FRUIT

1949 was a poor year for fruit growers, due primarily to a total U. S. non-citrus fruit production which was 11% above the ten-year average and 17% above the small crop of 1948. The commercial apple crop in New York was 37% above the ten-year average. As a result of heavy production, the farm price of most fruits declined more than the average of all farm products.

The fruit crop in 1950 probably will be smaller than in 1949. This will affect prices favorably, but the final price of course will be affected by other fac-

(Continued on Page 5)

PRICES RECEIVED and PAID by FARMERS

Baby Chick Season Just Ahead

SOME 80 million chicks will get their start in life this year on the farms in G.L.F. territory. Already on many farms, brooder houses are being cleaned, equipment assembled and a feeding program planned.

G.L.F. Service Agencies are ready now with complete selections of farm proved equipment, practical supplies and the right feed for building chicks into profitable broilers and productive pullets.

New "Zoned Heat" Brooder

Experience has shown that there is no single temperature which is best for all seasons and all types of equipment. For the first time this

year, G.L.F. Service Agencies are showing brooders which provide a range of temperatures best suited to each bird. (See Picture.)

The Zoned Heat Electric Brooder, a completely new principle in brooder design, lets the chicks choose the temperature. It provides a warm up zone and a hot spot where chicks can warm themselves quickly after being outside the brooder for exercise and to eat. Extensive testing has shown that this new type of brooder is highly effective in promoting better growth, feathering and health.

A complete selection of electric brooders, gas brooders and coal brooders is available now through your G.L.F. Service Agency, together with a full line of brooder stove accessories.

Feeders, Fountains For All Flocks

G.L.F. feeders and fountains are built to exacting specifications developed through years of research and proven on thousands of farms. Feed saving lips on G.L.F. feeders prevent the loss of feed spilled over the edge and onto the floor. G.L.F. feeders grow with the birds—the reels and legs are adjustable.

The G.L.F. Glass Fountain base affords another use for the empty fruit jars. Any mason jar used with this fountain base makes a good chick fountain in which the water line can always be seen. For a large number of chicks, the G.L.F. Single Walled Galvanized Foun-

tains will hold a larger water supply with fewer trips to the faucet necessary.

A Farm-Proven Chick Starter

Farmers' experience and science are combined in formulating G.L.F. Starter Mash. The high energy in G.L.F. Chick Starter increases the efficiency of the feed, because releasing this energy makes other nutrients more readily available for quick growth. This high energy factor makes it possible to grow more pullets per bag of feed. G.L.F. Chick Starter is truly a High Efficiency Feed.

Cooperative G.L.F. Exchange, Inc.
Ithaca, New York

CHECK LIST

Brooder House and Chick Needs

Electric Brooder Fans	Water Warmers

N. Y. State Grange Delegates Oppose Socialistic Schemes

IN HIS Master's address to the delegates attending the New York State Grange Session, Henry Sherwood emphasized several important points. Speaking December 13, the first day of the session, he blasted the Brannan Plan, pointing out that prices of farm products at unwarranted high levels would inevitably pile up bigger and bigger surpluses, followed by tighter and tighter controls. As substitutes he suggested upgrading the American diet as originally proposed by Ed Babcock, plus better advertising and merchandising of farm products.

Mr. Sherwood also expressed firm opposition to social security for farmers. "Large industrial concerns," said he, "doubtless can and do pass the cost of insurance to consumers, but farmers cannot do this. The entire cost will come right out of our income. But the more compelling reason why we are opposed to this compulsory insurance is one of principle. The Grange has al-

them in balance. No one wants to cut production."

Mr. Goss pointed out that there are two schools of thought on increasing consumption: 1. To increase wages without increasing production. To spread the work by shorter hours. To subsidize by government so individuals will have more to spend. This is the way to inflation and lower living standards. France has tried it. England is trying it without success. (2.) The second way, in which the Grange believes, is to produce efficiently and to pass the results along to everyone in lower prices. This is the way we have reached our high living standard. It has worked and will work if we give it a chance.

4-A Medals

On Thursday, four *American Agriculturist* Achievement Awards were presented. The winners were: **Future Farmers**—Kenneth Roberts, Holland Patent, Oneida County; Lyle Lehman,

AMERICAN AGRICULTURIST Achievement Award Winners. Left to right: Future Farmer Kenneth Roberts and 4-H members Geraldine Ann Shipley and Alvah Wayand. Absent when the awards were made was Future Farmer Lyle Lehman.

ways fostered those stalwart virtues of ambition, thrift and self-reliance that have made this country strong."

The State Master also came out strongly in opposition to the proposed divorce of Farm Bureau and Extension Service.

Officers Elected

This was election year and the following is the slate of officers elected:

Master, Henry Sherwood, Pine Plains, Dutchess Co.; Overseer, Leland Smith, Brasher Falls, St. Lawrence Co.; Lecturer, Florence Pickett, Rock City Falls, Saratoga Co.; Steward, Ralph Young, Endicott, Broome Co.; Ass't. Steward, Russell Curtis, Cazenovia, Madison Co.; Chaplain, Carl Fairbanks, Williamson, Wayne Co.; Treasurer, John Kleis, Hamburg, Erie Co.

Secretary, Harold Stanley, Skaneateles, Onondaga Co.; Gate Keeper, Arthur Speenburgh, Hunter, Greene Co.; Ceres, Laura Wyant, Castile, Wyoming Co.; Pomona, Lucinda Harvey, Marathon, Cortland Co.; Flora, Verna Phillips, Victor, Ontario Co.; Lady Assistant Steward, Mary Mable, Amsterdam, Montgomery Co.; Member of Executive Committee, Clyde Hitchcock, Bainbridge, Chenango Co.

Goss Speaks

Every speaker at the session had a message. National Grange Master Goss was present and addressed the delegates on Wednesday. He emphasized the three Grange guideposts as follows: (1) Wealth is produced by work; (2) Each man should profit in accordance with his contribution to the general welfare; (3) The chief purpose of government is to protect citizens against aggression, both economic and physical. Said he: "We must either increase consumption or cut production to keep

Castorland, Lewis County. **4-H Members**—Geraldine Ann Shipley, Williamson, Wayne Co.; Alvah Wayand, Penn Yan, Yates Co.

This year, all winners were present with the exception of Lyle Lehman who is attending college in the mid-West. The Award has been given annually by *American Agriculturist* for many years for outstanding achievement by members of youth organizations.

Oldsters Take Waltz Prize

In the old-time dance contest Mr. and Mrs. Campbell of Dansville Grange took first place in the Old Fashioned waltz. Mr. Campbell is 70 and his wife is 64. In the Money Musk square dance the winning set was chosen as follows: Mr. and Mrs. E. L. Samson, Greece Grange, Monroe Co.; Mr. and Mrs. John Lexer, Gowanda Grange, Cattaraugus Co.; Mr. and Mrs. Clyde Liles, Byron Grange, Genesee Co.; Mr. and Mrs. Stephen Stoltzman, Avon Grange, Livingston Co.; Mr. and Mrs. Lewis Henderson, Parish Grange, Oswego Co.; Mr. Roy Titus and Mrs. Virginia Conley, Benton Grange, Yates Co.

For winners in the sugar cookie baking contest see page 21.

Resolutions

As usual the study and discussion of resolutions took up a considerable part of the session. The Grange delegates passed resolutions as follows:

Favoring government economy, a halt in the increase in State or National debts, a pay-as-you-go policy and no additional taxes.

A state law to require the placing of all traffic lights over the center of the highway.

The closing of public drinking places at midnight and all day Sunday.

Urging all Granges to cooperate with

(Continued on Page 23)

"I found solid pipe comfort when I first tried Prince Albert,"

says *Walter Church, LOGGER*

"THERE'S NO BITE IN MY PIPE WITH MILD, RICH-TASTING PRINCE ALBERT. P.A. MEANS MORE SMOKING JOY TO ME!"

• Prince Albert's choice, naturally mild tobacco is specially treated to insure against tongue bite. And crimp cut Prince Albert stays flavor-fresh in the handy, humidor-top tin.

ANOTHER CHANCE!

He came to my desk with quivering lip—
The lesson was done.
"May I have a new leaf, Dear Teacher,
I have spoiled this one."
I took his leaf, all stained and blotted,
And gave him a new one quite unspotted,
Then into his tired eyes I smiled—
"Do better now, my child."
I came to the Throne with trembling heart—
The year was done.
"Have you a new year for me, Dear Master?
I have spoiled this one."
He took my year, all soiled and blotted,
And gave me a new one quite unspotted.
Then, into my tired heart He smiled—
"Do better now, my child."—*Author Unknown.*

THE TIDE IS TURNING

ALMOST ALL farm organizations, including the National Grange and the American Farm Bureau Federation, the two largest, have passed resolutions condemning Secretary Brannan's plan. This plan, you will recall, subsidizes the farmer and gives the consumer cheap food, the difference to be paid by taxpayers.

Before the annual meeting of the American Farm Bureau Federation in Chicago, attended by hundreds of farmer delegates from all over America, Secretary Brannan wrote to President Kline of the American Farm Bureau Federation, criticizing Kline because Secretary Brannan or his representative was not to be on the Farm Bureau program to discuss the Brannan Plan. He stated that it would be fair to hear both sides. To this Kline answered in a letter that bids fair to be a historical document. He said:

"Dear Mr. Secretary:- The implication in your letter of December 10 that a group of free American citizens cannot objectively discuss both sides of a question of policy unless the discussion is guided by some Federal appointee can hardly be made seriously. . ."

At the meeting, without mentioning the Brannan Plan by name, President Kline forcibly discussed the principles involved in it and other government schemes to regiment agriculture. At the conclusion of his speech the great meeting of delegates cheered their President to the skies for what he had said, and went on record emphatically disapproving such government schemes as the Brannan Plan and endorsing sound economic policies. The National Grange did the same.

It has been claimed that farmers, particularly those in the Midwest, are in favor of any and all schemes for heavy government subsidies to agriculture. These big farm meetings, with strong representation from the Midwest states, prove that the thinking of Midwest farmers as well as that of other American farmers is still sound.

SUGGESTION TO WOMEN FOLKS

AS YOU LOOK BACK on the old year or forward to the new, some of you, particularly when you are tired, may think of the endless road ahead of getting three meals a day, washing the dishes, and doing all the other recurring tasks that go into making a home.

I am only a mere man, but it seems to me that one way to vary that tiring monotony is to keep trying something new, and I am judging by the experience of my mother, who kept young and happy in spirit to a ripe old age although she had more than her share of trouble. She was interested in many things. One needed a guide to get through her house, it was so filled with her many hobbies.

A lot of women get fun out of cooking, judging by the tremendous demand for *American Agriculturist* recipes. Why not make a hobby of collecting and trying old-fashioned recipes or those from other countries? Keep a variety of items on your pantry shelves such as tomato paste, curry, garlic, nippy

By E. R. Eastman

cheeses, spices, and herbs and try out new flavor combinations.

If not interested in cooking, how about trying to make more clothes for yourself or family? Patterns from *American Agriculturist* and other sources will help you. Perhaps you have more time now than you did when the children were small.

Maybe you could have fun redecorating a room, doing most of the work yourself and doing it just the way you want it or the way you think it will please your family best.

How about planning the modernization of your kitchen even though you can't afford it right now?

New things keep one young and interesting as well as interested. It is monotony that makes work difficult. Thinking and planning will do much to eliminate drudgery and monotony from the daily round.

SELL THE SURPLUS TOO

AS YOU WILL NOTE in the statement on Page 6, progress is being made in finding a formula that will automatically set the price for Class I-A milk in the New York milk shed. Also, a hearing has been called on January 23 at Elmira, N. Y., by the U. S. Department of Agriculture to discuss the price of milk for manufacturing purposes. The pricing of milk not used for fluid purposes is equally important with putting a price on fluid milk, for it could easily happen that manufactured milk could be priced so high that it could not be sold, and high enough to attract manufactured products from outside the milk shed and cut down our own markets.

The finding of satisfactory methods for pricing both Class I milk and the manufactured classes is one and the same problem, for the price of fluid milk cannot be properly determined without taking the price of milk for manufacture, or surplus milk, into consideration at the same time.

It should be remembered that the first purpose of the milk marketing Order was, and is, to solve the surplus problem, which from time immemorial has borne down the price of fluid milk. Dairymen have to face the problem, too, that right now there is too much surplus milk in all classes, and that this was the case even during the late fall, when there is usually a shortage.

The first requirement of every dairyman in the milk shed is a market for all of his milk every day in the year. The second requirement is to get every cent out of that market that good organization can get and that the market justifies. That means a market for the surplus milk, too.

KILL RATS

IT has been estimated that there are twice as many rats on farms as there are human beings—some 60 million. The average annual loss from these vermin is about \$63,000,000 per year. On a farm where there is grain the loss is enormous.

To keep the rat population down means constant warfare, with many different procedures such as rat-proofing farm buildings; using poisons like red squill, Antu, arsenic, phosphorus, etc.; trapping, and the use of poisonous gases. In my own case, I have found cats the best rat control, but my problem is to keep the cats alive. We live on a heavily traveled highway, and cats just don't seem to know enough to keep out from under the cars.

THE NEXT FIFTY YEARS

TO anyone over fifty years of age who looks back and thinks about what has happened in the past half century, the changes that have occurred seem stranger than fiction. If in the 1890's someone could have prophesied the hundreds of changes that have

actually taken place since then, he would have been set down as a fool.

By the same token, not even the wildest liar among us today can tell a "tall story" about what is going to happen in the next 50 years that would equal what the truth will be. I am going to make just one guess, though. If we don't do more to equalize spiritual progress with mechanical and material progress, then the world will be a sad place in which to live fifty years from now, if indeed there is any world left.

TEAMWORK IS NEEDED

"Mrs. Hilfinger and I have just returned from the Christmas service at the Syracuse University Chapel, where we listened to Dean Noble talk about Christmas and its origin. Of course I have heard the story many, many times, but this morning when he went on to say that our salvation started in the "little town" of Bethlehem, the whole picture took on an entirely new meaning. It wasn't in the big cities; it was in the little towns that the Christian era was launched.

"How true that is today, Ed, nearly 2,000 years later! We cannot solve one present problem, religious, economic or political, in the big cities. It must now, as then, come from the "little town," which to us today means the rural areas, your areas. How essential it is, therefore, that we should and must work shoulder to shoulder to preserve our private enterprise system of business as well as religion.

"That sermon, Ed, gave me new courage and a greater respect for the great battle rural people are waging. Business men must work more closely with rural folks, and they must understand each other's problems. I am sure you will understand the spirit and frame of mind that impels me to pass this morning's experience along to you."

THE above letter, which is in itself a sermon on peace on earth, goodwill to men, was written to me at Christmas time by my friend, Martin F. Hilfinger, President of Associated Industries of New York State.

NUISANCE REGULATIONS

THE NEW YORK State Farm Bureau Federation contends that the permits issued to farmers for movement of farm machinery on public highways are practically useless and that they do not contribute to public safety.

That is right. It is nonsensical, as well as costly, to require a farmer to pay for a permit to move his machinery from one field to another on his own farm, even where he has to go on the highway in order to do it. The Department of Public Works or the Legislature this year should do away with these nuisance and useless regulations.

THE JOB OF UNLEARNING

NOT so long ago, one of the first things dairymen did when buying a new cow was to take note of the udder veins and the milk well. These were supposed to be indicative of heavy milkers. Now we are told that they are of no account in judging a cow.

One of the discouraging jobs in education is to unlearn things we have been taught!

EASTMAN'S CHESTNUT

ONCE UPON A TIME three turtles thought they wanted a cup of coffee. After they got into a restaurant, it began to rain, so the great big turtle said to the little tiny turtle:

"You go home and bring back an umbrella."

"I will," said the little one, "if you won't drink my coffee."

The other two turtles promised. About three years later the great big turtle said to the middle-sized turtle:

"It doesn't look as if the little turtle is coming back, so let's drink his coffee."

Whereupon a little voice from just outside the door yelled:

"If you do, I won't go!"

Farm Prospects in 1950

(Continued from Page 1)

tors, such as size of crop and demand.

Production costs per bushel of fruit have not declined to the extent that unit costs of most other farm products have dropped.

Potatoes

Two important factors in the potato situation are: (1) consumption has dropped from 200 pounds per capita before World War I to about 110 pounds per capita at present; (2) production per acre has steadily increased due to such developments as DDT to control insects, heavier use of fertilizer, and increased use of irrigation.

Nationally, the potato acreage called for this year is 1,137,800, a decrease of 85,300 acres or 7%. Marketing agreements are called for in all commercial areas in order to get benefit of price supports. Price supports will be down slightly from last year, probably about 20 cents a cwt. **Some way must be found to bring production into balance with demand.**

Government

While there are many things that the individual farmer can do to affect his income, and which we will discuss a little later, what government does or fails to do will also have a great effect on your farm income, particularly from a long-term point of view. While there isn't much that an individual farmer can do other than to tell his congressman what he wants, these developments should be watched and decisions changed to meet them.

Government action will affect buying power of money. Right now factors that affect inflation seem stronger than those that affect deflation. Probably this trend will change.

Favoring inflation are: continued deficit spending, easy credit and low interest rates, government checks going to millions of our citizens, subsidized housing, old age assistance, continued price supports, and recent wage increases (mostly in the form of pensions).

On the other hand, deflationary factors now operating include: some increase in unemployment, which may be temporary; public resistance to high prices, which has cut demand; probable drop in exports to Europe, reduced investment in new manufacturing plants and equipment, and a lower farm income in 1950.

The biggest inflationary factor is deficit spending. There are at least three good reasons why government costs should be cut drastically, namely, to balance the budget, to reduce the national debt, and to reduce taxes, all

of which would have a stabilizing effect on our national economy, of which agriculture is an important part.

Management

There are, however, many things that farmers can do. Here are a few suggestions:

1. **Set up a budget of income and expenses for 1950.** Make this budget conservative, and check your business against it several times during the year. In times of declining prices there is always a temptation to put off reducing personal expenses as long as possible. In the last depression many individuals finally woke up to find they were in exceedingly bad financial shape, which could have been partly avoided if early action had been taken. **Living standards should not be cut drastically,** but it will pay you to be realistic in watching your income and out-go and to keep them in balance.

2. **Set up a sensible but workable system of farm records.** You may have done this already; if so, maybe you can improve them. The first step is to take a farm inventory which, continued year after year, will give you more information for the time it takes than any other record. So far as other records are concerned, keep in mind that figures on your cash income and expenses will help you with your 1950 income tax return and will give you information on which to base changes in your farm program.

3. **Cut production costs where it can be done economically.** In general, this will mean planning your work to avoid unnecessary labor and to get high production per hour of work performed. In many cases this will mean the substitution of machines for muscle. It certainly will include the culling of low-producing animals and, in most cases, it will include the liberal use of fertilizer in order to increase production per acre and per man.

4. **Check carefully on capital expenditures, especially if they involve long-time credit.** If prices continue to go down, you will be paying your debts with more cans of milk or more bushels of potatoes. However, if unhandy buildings are increasing your labor costs and if you have the money to invest, consider remodeling. The same general procedure can well be followed with new equipment.

5. **Consider increasing your farm income by "vertical diversification."** The term "vertical diversification" means that instead of diversifying by grow-

(Continued on Page 12)

Ten Reasons WHY YOUR BEST BUY IS

NATURAL CHILEAN NITRATE

1. **Natural.** Chilean Nitrate is the only natural nitrate in the world.

2. **Nitrate Nitrogen.** The nitrogen is 100 per cent nitrate.

3. **Sodium.** Chilean Nitrate contains about 35% sodium oxide (Na₂O). This acts like potash (K₂O) and helps to make the phosphate in the soil more available.

4. **Iodine.** Chilean Nitrate contains iodine to help meet the needs of plants, animals, and human beings.

5. **Other Plant Food Elements.** Chilean Nitrate contains small quantities of other elements that contribute to strong, healthy plant growth, such as manganese, potassium, magnesium, boron, calcium, iron, sulphur, copper and zinc.

6. **Ideal Condition.** Chilean Nitrate

comes in free-flowing pellets — easy to handle and to apply in any distributor.

7. **Quick Acting.** Chilean Nitrate is immediately and completely available.

8. **Anti-Acid.** Chilean Nitrate helps keep the soil sweet.

9. **Time-Tested.** Chilean Nitrate has been proved by more than 100 years of research and practical farm experience.

10. **Doubly Profitable — Economical.** Chilean Nitrate improves the quality of crops as well as the yield. Consistently excellent effects of heavy applications year after year upon crop and soil alike make it an outstandingly profitable, economical nitrate.

• Natural Chilean Nitrate is now back in full supply. Specify it by name when you order your fertilizer.

NATURAL CHILEAN NITRATE of SODA

Most Flexible TILLAGE TOOL you've ever used

Model shown works 8' Also available in 12' width.

You can quickly detach the packers . . . use harrow or packers separately . . . trail both packers BEHIND or AHEAD of the harrow.

Harrow adjusts itself to turns. Teeth keep working. Packer discs follow in the same track. No skidding or wobbling, even on sharp turns.

Five tools for the price of one! You can use this new Le Roy combination tool five different ways to get the right tillage in any soil, for any crop. Harrow and packers can be used alone, or assembled quickly three different ways. As shown above, it breaks clods, then harrows, then packs and firms the soil. Harrow teeth are adjustable . . . can be spaced exactly as you want them. Harrow is hinged, not rigid . . . hugs uneven ground and works every square foot. Harrow and packers stay in line and till thoroughly even on sharp turns. Four portable sections . . . can be stored away quickly, by hand, in 4 x 8' or 4 x 12' space. See it at your dealer's now.

The Song of the Lazy Farmer

again; so this year I am promising myself to try to work the real lazy way and toil a half hour every day.

TO BE an expert lazy man you have to look ahead and plan; because, no matter how you try, you simply can not quite get by without a little chore or two that now or later you must do. And so to have an easy life and stay on good terms with your wife, you have to plan your time ahead in order that your work is spread; then you can work an hour a day and still have time to rest or play. The longer things are left undone, the more you'll ruin all your fun, 'cause you'll get caught and have to pay by workin' seven hours some day.

Last year I didn't do as good at being lazy as I should. Sometimes I went a month or more and never did a single chore like cleanin' out the chicken house or choppin' firewood for my spouse; the editor lost lots of weight because my "song" was always late. That system wasn't good for me, for ev'ry month or so there'd be a day on which I'd have to sweat like ordinary men to get caught up myself to try to work the real lazy way

Dairymen Will Vote on New Class I-A Price Formula

ON DECEMBER 15 the U. S. Department of Agriculture recommended a new formula for pricing Class I-A milk for the New York City market. With some minor exceptions the proposed formula follows the recommendations of the Milk Shed Price Committee appointed by Administrator Blanford in November 1947. The committee was made up of ten able economists from the Northeast headed by Dr. F. F. Hill, head of the Department of Agricultural Economics and Farm Management at Cornell.

The committee reported its findings at a meeting of dairymen at Syracuse last February, and a series of eight hearings were held in the Milk Shed last fall at which dairymen were given an opportunity to express their views concerning a new price formula.

Three Factors

In line with the recommendations of the Milk Shed Price Committee, the formula proposed by the Department of Agriculture is based on the three following factors:

1. The general price level.
2. The market supply of and demand for milk as indicated by the percentage of the total supply consumed as fluid milk.
3. A price incentive to increase fall production. Under this provision the Class I-A price in May and June would be 88% of the year's average and in November would be 109% of the year's average.

The base price to which the formula will be applied is the average Class I-A price in 1948, which was \$5.66. That year was recommended by the committee and accepted by the Department of Agriculture because the relationships between the general price level, production costs, and milk prices were considered to be fair to all concerned.

The proposed Class I-A price formula, or some variation of it, will be submitted to producers for their approval on a date not yet set. If two-thirds of all producers in the Milk Shed give their approval it will become effective and will work something like this:

Each month the base price of \$5.66 will be modified by applying the three factors in the formula, namely, the index of wholesale prices, supply and demand as shown by the percentage of the total supply used as fluid milk, and a slight increase in the fall price and a decrease in the spring price to encourage steady year-round production.

Hearings

A year ago, the Milk Shed Price Committee recommended this formula plus two yearly hearings, one in February or March and another in September, and with the provision that other hearings be called when needed. The present USDA proposal is that hearings be held whenever for three consecutive months the relationship of production costs to the general price level or to the Class I-A price gets seriously out of line. When either of the above two conditions occur, the Secretary of Agriculture is required to call a prompt hearing on the Class I-A price or announce his reasons for not doing so.

At last fall's hearings on the proposed Class I-A formula there were some differences of opinion. One group proposed basing the Class I-A price entirely on cost of production. A big majority seemed to feel that such a proposal had many difficulties.

The Metropolitan Producers Bargaining Agency and the Dairymen's League

proposed a formula based on two factors, the general price level and the index of the cost of milk production as compiled by the New York State College of Agriculture. Recently, when the proposed USDA formula was made public, opportunity was given dairy organizations to file objections, and this has been done by the League and Bargaining Agency. The chief objection of these two organizations, based on a belief that the formula will give a price that is too low, is that the proposed formula gives too little weight to production costs. On the other hand, it has been pointed out that practically all of the prices used in computing the general price level do reflect labor costs.

Pricing Surplus Milk

Right now the price of milk for manufacture is also in the limelight. There is a group which is pressing for high prices for milk for manufacture. There is another group, led by the League and Bargaining Agency, which believes that surplus milk for manufacture must be priced so that it can be sold in competition with milk from other areas. This group maintains that nothing is gained by pricing surplus milk so high that it cannot be sold. Furthermore, with milk for manufacture priced too high there is a constant danger that such milk will find its way into the fluid market at cut prices and thus endanger the whole price structure. A hearing has been called at the Mark Twain Hotel, Elmira, N. Y., on January 23 to discuss prices for milk in excess of that needed for fluid milk and fluid cream.

In the meantime, the January and February Class I-A price for New York City was reduced 44c a cwt., from \$5.24 to \$4.80. This reduction was made by the USDA in the face of many protests from farm groups who felt that with little or no reduction in costs there was no logical reason for making a price cut. The provision that tied the New York price to the Boston formula expired January 1, and of course the old formula would have brought a ridiculously low price. The hope, of course, is that the new formula, if adopted as announced, or if accepted with amendments, will result in a price in the New York Milk Shed which will reflect economic conditions and be fair both to producers and consumers.

— A.A. —

FAIRS DIE HARD!

The Genesee County Fair Association lost \$3,300 on this year's operations. The fairgrounds where it once flourished are now owned by a racing outfit. But apparently there is demand for a rural fair, so the association has bought a farm on which to start all over again!

Letters to the Editor

FORUM ISSUE RINGS THE BELL

Space permits the use of only a few of the many letters from readers commenting on the Second Annual Forum Edition of *American Agriculturist* published December 3:

I wish to commend you for the editorial "Wake Up America," which appeared in the December 3 issue of your publication.

I sincerely hope you will go one step further and see that it reaches the desks of all members of both houses of Congress, as well as our President, who seems to have forgotten the principles which made America great. — A. M. Worden, Wolcott, N. Y.

I wish I were near enough to give you a slap on the back and tell you to go to it. We certainly need someone to raise an outcry against the present steady drift towards statism. The government is giving and promising everybody everything that will get votes for another term in the White House, even though we are going into another year with a deficit of about 5 billion.—D. J. R. Avoca, N. Y.

Your special Dec. 3 magazine issue is a dandy. I have read nearly every article already and am going right through to the back cover. It strikes me as the best issue you have ever put out! And that is saying a lot. Keep up the good work. — Charles M. Gardner, Former High Priest of Demeter National Grange, Springfield, Mass.

Congratulations on your issue of Dec. 3. The *Agriculturist* is the admitted leader in this fight for good government. A large majority of our people do not fully realize the economic mess that must be made right. As the old saying goes, "This is worth fighting for." — F. E. Robertson, Montezuma Farms, Savannah, N. Y.

Let me congratulate you on the biggest and probably one of the very best issues of *American Agriculturist*, the December 3 number. . . . It strikes me that you have been fearless in publishing a lot of very appropriate material. My only hope is that copies will fall into the hands of some of the men who should follow the suggestions that you have published. — W. Floyd Keepers, Executive Secretary, Barn Equipment Association, Chicago, Ill.

After reading your good paper today, I want to add my *Amen* to your proposed new declaration of independence.

—H. N. Sexton, Earlville, N. Y.

I am writing to express to you my very sincere appreciation for your fine work in bringing together such a large number of contributors as printed in the Second Forum issue. Last year's Forum issue was good, but this year is much better. You and your helpers are doing a wonderful job in trying to bring to your subscribers a better realization of the seriousness of conditions that are confronting dairy farmers, not only in the New York milkshed, but in all parts of our U.S.A. If enough loyal citizens can wake up to the seriousness of the present day, and are ready and willing to work and act together, we can still have "the land of the free and the home of the brave!" — G. W. Medbury, Rockdale, N. Y.

We enjoy *American Agriculturist* very much and have taken it ever since we have been on the farm. We enjoyed the article on socialized medicine and are glad to know so many are against it. Our doctor, Dr. Arthur C. Hartnagel, deserves a lot of credit for his efforts to kill socialized medicine. It is time people woke up and demanded a free country again. I am one of Dr. Hartnagel's patients and a farmer's wife. — Harriette L. Wilson, Berkshire, N. Y.

Last night I read the December 3 issue of *American Agriculturist*, the edition of your Second Annual Forum of Business and Agriculture, and hasten to send you my sincere congratulations. It is truly a wonderful issue.—Victor Emanuel, Chairman and President, Avco Manufacturing Corp., New York, N. Y.

Memory is Short...

but...The "Manufacturing" Milk Problem Flows On and On!

The federal-state milk marketing orders were adopted by dairy farmers to regulate the sale of milk for manufacturing purposes when there was more milk than could be disposed of profitably in fluid markets.

Too many of us have forgotten that fact. During the booming scarcity years, it was only natural to forget, or to consciously banish from the mind, if need be, the harrowing memories of chaos and despair, of cut prices and cut-throat tactics that forced many of us to the very brink of bankruptcy back in the 30's.

The Wolf is Back at the Door

But if human memory is short, the surplus milk problem is long . . . very long indeed. It is back with us again, and for the self-same reason—we are producing more milk than can be sold profitably in fluid markets!

Once more the marketing orders are performing their intended mission . . . that of regulating and stabilizing the market . . . that of helping to prevent "manufacturing" milk from being forced into fluid channels at cut prices.

Yet Even Today We Have Dissenting Voices

Yes, even today,—in spite of the last 11 years' record of success—certain elements in our industry are seriously threatening the successful operation of the marketing orders. They are endangering the protective features of the whole marketing plan by their insistence upon too high prices for milk sold in manufacturing classifications.

Prices too high for milk used in manufacturing, invite these dangers:

1-cause handlers to refuse to accept producers' milk;

2-cause manufacturers to halt their operations, and

A-thus throw a greater burden upon farmers' cooperatives that have facilities for handling the milk, or;

B-force the milk into fluid markets at cut prices.

(It must be remembered that prices can be cut without actually selling the milk for less than the classified price. They can be cut by shaving the handling and/or the transportation charges. Either of which results in cheaper milk for the city distributor who can then cut rate to undersell his competitors and thus break down the entire price structure.)

There is only one workable answer to this pricing situation. That is to price milk going into manufactured products so that it can meet the competition of milk from other and lower-cost producing regions.

Dairy farmers should think back to the grim days before we had marketing orders. They should make everyone understand that they want classification prices that will sell all their milk all the time, and not prices that will break the price structure . . . prices that will leave milk on the farm . . . or prices that will wreck the marketing orders which have served all dairymen so well.

Scarce Protein

By George Serviss

THERE IS never enough food in the world to feed all the people adequately, nor anywhere near enough feed to produce the livestock needed to provide the world's population with a diet approximating that enjoyed by the United States. While a large section

GEORGE SERVISS

of the world's people and livestock are underfed in total, a much larger part suffers from a lack of protein in the diet. Dr. Firman E. Bear of the New Jersey State College of Agriculture in a recent address said: "If the whole world ate in accordance with our standards, not over one-third of its 2 1/4 billion people could be fed at present world production levels."

One of the distinguishing things about our diet as compared to most of the rest of the world is protein. Even in this country many people do not consume enough, and our protein "cushion" for livestock feeding would shrink to nearly nothing if all of our livestock were properly fed. We are not going to attempt in this article to solve the world's protein problem. We will, though, discuss some of the things that might be done on a farm to supply needed protein economically.

More Nitrogen Needed

The basic fact that cannot be ignored is that nitrogen is the basis of protein. In other words, the production of protein on any farm is governed first of all by the nitrogen level being maintained by the soil management program in effect. You might just as well try to make bread from stones as to try to produce protein without nitrogen.

It is neither necessary nor economically feasible to buy all the nitrogen necessary for the production of high yields of high protein crops. However, on the great majority of farms in the Northeast it is profitable to use more fertilizer nitrogen than is now being used. This would not only increase yields in total but also maintain a somewhat higher protein content.

There are a number of things that can be done to produce more protein on northeastern farms. The first and biggest single move is to get more legumes in our haylands and pastures. Alfalfa hay on the average analyzes about 15 per cent protein and timothy about 6.5 per cent. First year hay usually has a satisfactory legume content, but after the first year on the average the legume content rapidly declines except with alfalfa on good alfalfa soils or ladino pastures that are properly managed and fertilized. Better management and fertilization will definitely prolong the life of the average field of ladino or alfalfa. Ladino, though, is difficult to maintain when used solely for hay, and much of our land is not suitable for alfalfa. Birdsfoot trefoil, we all hope, will prove a large part of the answer, but we could use to advantage a truly perennial red clover and perennial alsike.

Cut Hay Early

The next step to improve the protein situation on the average farm is to cut hay at an earlier stage of maturity. Early cut timothy contains about 9 per cent protein as compared to 6 per cent for late cut. Early cut red clover often contains 15 per cent of protein as compared to a probable low of 11 per

cent for late cut. Many farmers have gone as far with early haying as the weather will permit, and will need to go into grass silage to make any further progress. There are many, though, who can definitely start haying earlier in many years.

Varieties of the same crop differ in protein content. For instance, at Cornell in 1946 oat varieties under test varied in protein content from 12 per cent to 15 per cent. Penn State reports that experimental single cross hybrid corns grown in 1948 varied in protein content from 8.48 per cent to 14.13 per cent. Even greater extremes in corn have been reported from other places, but this appears to be close to a normal range. Not a great deal of emphasis has been placed on protein content by plant breeders until very recent years. Now they and other scientists are not only studying the total protein content of new varieties, but also vitamin content and other factors that might affect nutritional value.

Nitrogen, as we stated earlier, is the basis of all protein. While varieties of a crop such as corn may differ somewhat in their average protein content, the protein content of a single variety is also variable. Generally speaking, crops grown with an adequate supply of nitrogen will contain a higher percentage of protein than the same varieties grown with insufficient nitrogen. In Illinois trials with an experimental high protein hybrid, the protein content varied from 10.9 per cent to 17.2 per cent. This was in direct correlation with the supply of nitrogen available. In this case, it was fertilizer nitrogen, but other work indicates it makes no difference to the crop whether the nitrogen comes from legume sods, manures, commercial fertilizer or a combination of all three.

Extra Value

We are not advocating that we apply nitrogen in excess of the amount required for maximum profitable yields, but if enough nitrogen is supplied from one source or another to obtain such yields, an additional benefit on any farm where the crop is being fed will be more protein.

To sum the matter up, there is no question but what we can produce more of our protein requirements here in the Northeast economically if (1) we manage and fertilize our pastures and haylands to maintain a higher proportion of legumes to grass, (2) harvest our hay crops earlier, and (3) provide our non-legume crops with a more adequate supply of nitrogen for growth. Step number one—more legumes in our pastures and haylands—will contribute much toward a more adequate nitrogen supply, but fertilizer nitrogen is also important. From the long range point of view, one might add somewhat higher protein varieties, but we do not yet know how far in this direction it will be practical to go.

—A.A.—

USE "SUPER"

One hundred pounds of superphosphate used in a gutter will hold from 3 to 5 pounds of nitrogen which at present prices is worth around 80 cents, according to Lester Smith of the Vermont Agricultural College. If superphosphate is not used, he adds, about half of the 4 pounds of nitrogen per ton of manure will escape into the air.

A load of manure where superphosphate has been used in the gutter and where 10 pounds of muriate of potash have been spread on the top of the load is about equal to 100 pounds of a complete fertilizer analyzing 7-15-15.

Best Eating! Best for Freezing!

ROBSON'S SENECA CHIEF HYBRID SWEET CORN

Today, just 2 short years after its introduction, Seneca Chief is hailed by growers everywhere as the "best eating" sweet corn ever developed. Extensive tests have also found it best for freezing. Make the test yourself this year. You won't be sorry! Yellow kernels are narrow, deep, very sweet and tender. Lb. 95c; 5 lbs. \$3.45, generous trial package..... **25¢**

The miracle of meat

ALL of us in the livestock-meat industry know that meat is appetizing, wholesome, satisfying. "It sticks to the ribs." People *like* it. But perhaps we don't all realize just what a miracle food meat really is. We know it's good—but do we know how good it is *for* people . . . how important to the health of individuals, to the health of the nation?

If you feed livestock or poultry you know the importance of protein in their ration. It's just as important in the human diet. Proteins are known as the *building blocks* of the body. They build and renew the living cells in muscles, tissue and blood.

Meat supplies the essential protein in a form that our bodies can use most readily. The most valuable protein foods—meat and poultry, milk, eggs and fish—all contain what are known as amino acids. There are 23 different amino acids. *Ten of them are absolutely essential to human health. All ten are found in meat.* Important vitamins, too, like riboflavin, niacin, thiamin . . . and "APF" (animal protein factor), the newly discovered, *very* important vitamin B₁₂ that's found only in animal products.

Most of these new discoveries about the nutritional value of meat have been made in the past fifteen years. Credit goes to research scientists in the universities, in government service and in the privately financed laboratories of industry, such as Swift's Research Laboratories.

The more people we can tell the above facts, the better for all of us. First, the people who often eat meat and other protein foods regularly will be healthier. Next, with ample meat in their diet, they'll get more benefit from the cereals, fruits and vegetables and *other* foods they eat. And, of course, the more meat that's eaten, the better the demand for meat and the better the market for livestock.

Swift & Company has often said, "Nutrition is our business." It's yours, too! So when you talk with your friends and neighbors, *tell them these facts about "meat, the miracle food."* We will continue to tell them, too, by our advertising; and by passing along to them the findings of our Research Laboratories and Martha Logan Test Kitchens.

Every livestock producer and meat packer has a vital public interest and a private personal interest in promoting better nutrition in America. Let's work together in promoting it!

OUR CITY COUSIN

"Gee, Country Cousin, 'tain't no joke . . . Old Nell's afire. She's breathing smoke!"

Martha Logan's Recipe for PORK AND NOODLES

(Yield: 5 servings)

1 pound ground pork	4-oz. package noodles
1 egg	2 quarts boiling water
Seasoning	½ cup diced green pepper
Flour	1 cup diced cooked rutabaga
	2 tablespoons shortening

Combine pork, egg, and seasoning. Form into 1-inch balls. Roll in flour. Brown in hot fat. Boil noodles in salted water 10 minutes. Drain. Combine noodles, green pepper, and rutabaga. Place in greased 2-quart casserole. Place pork balls on top. Bake in a moderate oven (350° F.) about 40 minutes or until pork is well done.

Quotes of the Month

"Every time a customer makes a purchase he casts a vote for or against a business. That vote determines which business shall be small, which shall grow and which shall fail. There is only one way a business can survive in America—that is by winning the votes that are cast daily by the American buyer."

Paul F. Clark, *President*, John Hancock Mutual Life Insurance Company

"You, a human being, cannot eat grass. But a cow or a sheep can, and they'll turn the grass into many things you can eat and wear. There you have the fundamental reason why this country should go on maintaining its herds of livestock at the highest possible level."

Chicago Daily Drovers Journal

"No more real service can be rendered than by improving agriculture."

George Washington

Where the Meat Goes...

It's a large country, this United States . . . with close to 150,000,000 people in it. They live on 5,859,169 farms and ranches, and in about 125,000 cities and towns. Most of these millions of people want meat. Last year they ate an average of 146 pounds of it apiece. That adds up to over *twenty billion pounds*—to be distributed all over the 2,977,128 square mile length-and-breadth of our country.

That's a man-size job. To handle it takes the services of over 4,000 meat packers (including Swift & Company) and 14,000 other commercial slaughterers of livestock in the United States. The average 1000-mile gap between where the livestock is produced and where the meat is eaten must be bridged. One end of our "bridge" reaches west of the Mississippi, where two-thirds of the meat animals are produced. The other end reaches the markets to the east, where two-thirds of the meat is consumed.

But that's only *one* of the jobs we do. Another important one is to match up the nationwide supply against the nationwide demand. From day to day the numbers and grades of animals marketed vary greatly (which accounts largely for the day-to-day ups and downs in livestock prices). Also from area to area the people's meat preferences vary greatly. In New York and Boston they want heavy beef cuts. Pork eaters in Los Angeles and Baltimore prefer the lighter, leaner cuts. And so it goes, all over the map. It's an important part of our job to see that the various grades of meat and kinds of cuts go where there is the highest preference and most demand for them. Thus Swift & Company renders a twofold service—both by bringing to consumers the kind of meat they want, and by bringing to producers the benefit of a nationwide demand.

Farming as a Business

H. B. Howell, *Ext. Farm Management Specialist* Iowa State College, Ames, Iowa

Good farm planning anticipates changes. It includes not only decision on how to use available resources—your land, labor, and capital to produce an income—but also how to use the income after it is produced.

H. B. Howell

Studies of records kept on 51 Iowa farms (160 acres each) in 1948 reveal some fundamentals of successful farming:

1) Production or volume of business is of first importance. The high 17 farms averaged \$14,000 production per man; the low 17 farms only \$7,800.

2) The top farms used a combination of all resources—not just some of them—to get the greatest return. They fed enough grain to make efficient use of roughages; kept enough land in sod to maintain fertility; raised enough livestock and crops to keep man power fully employed; had enough machinery to do the work efficiently.

3) Good practices paid dividends. The best 17 farms produced \$177 worth of livestock for each \$100 worth of feed fed, while the comparable return was only \$117 on the low 17 farms. Top farms averaged 87 bu. of corn per acre; low farms only 67 bu. Good practices can easily increase crop yields and feed returns by 20 per cent.

4) Farm records, such as used in this study, help measure results; show up weak spots and make a sound basis for planning ahead. Your state extension service can help you set up the proper kind of records for your farm or ranch.

What Do YOU Think

By JIM HALL

THE LOWLY plow was one of the first man-made contrivances designed to loosen up the soil, but people are still arguing about whether or not one should be used. Poems have been written praising its part in the development of agriculture and world peace. Books have been written condemning it as a waster of our precious top soil. Some men have made more money writing about plows than farmers have made using one, but the plow still does one of the biggest and most important jobs on Northeast farms. As yet few farmers have thrown their plows away for other methods of preparing the land.

But how deep should different soils be plowed for various crops and how should they be fitted for best results? I have answers from dairy, poultry and crop farmers all across the Northeast, from men with as little as 31 acres to as much as 4,000. One man says: "The answers to most of your questions are obvious, but others are open to all-day discussion and much disagreement." How right he is!

First, I'll outline the plowing and fitting program followed by Edward C. Norton of Smith's Basin, Washington County, New York. He says plowing depth should vary from 5 inches for heavy clay to 8 inches for loam. "I plow from 5 to 6 inches for corn and oats, which gives me plenty of soft soil for the seeds and leaves the bottom firm so that it will hold moisture for the plants later in the season. For potatoes I plow 8 inches to have plenty of loose soil for hilling."

Fitting Without Plow

When dairyman Norton fits land without plowing "it usually is on land that corn was on the year before. I use a cutaway harrow about twice over for a good job. Then I use a spring tooth harrow set medium depth with a smoothing drag hitched behind. This equipment makes a mellow seed bed for oats and grass seed mixture." In fitting other land he "first plows in the fall so that winter freezing will mellow up the soil. In the spring when it's dry I disk it over once or twice to set back the weeds and grass. At planting time I disk again and then it's ready for smoothing and packing, which I do with a spring tooth harrow set light with a smoothing drag hitched behind. Once over crossway of the way it was plowed usually is enough. Only then do I consider the land ready for planting."

Plow 16 Inches Deep?

It is differences of opinion that make the world interesting. Hans Rogner of Ballston Spa, Saratoga County, New York, says: "Land should be plowed 16 inches deep, but who can with the plows we have now?" Hans plows just as deep as he can with two 14-inch bottoms behind his Ford tractor and averages between 8 and 10 inches. His fitting is all done with an 1,100 pound disk but he wants to get a heavy Dearborn cultivator to "tear up all my pasture land."

At the other extreme in the "How Deep to Plow" scale is poultryman G. Gilman of North Fryeburg, Maine, who grows a big garden plus sweet corn and string beans for canning factories and retail trade. He told me: "I believe

in keeping the organic matter as near the surface as possible so if I can break up the land in any other way but plowing I do so. This year I simply disk-harrowed a poultry range and planted beans. They did very well. In the past I have reseeded range to Ladino clover by the same method—no plowing." Rose Brass of New Woodstock, New York, says: "Get the organic matter buried deep for better tilth and drainage."

From Berkshire County, Massachusetts, comes word from a man who forgot to give me his name, that you should plow only if you cannot work in proper cover crops any other way. He claims that with the right soil, land can best be fitted using a disk or bog harrow, roller, spring tine harrow or cultivator and a split-log drag. He'd like to have for efficiency a "properly balanced, sure-cutting bog harrow, a tractor-size spring tine harrow to replace the spike tooth harrow and log chain, a packer with seeding attachment for economy of seed, and a real ground-hugging disk harrow."

Most men who participated in this plow discussion with me are somewhere between the extremes related above. Otto A. Badger of the huge Mallory Farm at Farmington, Maine, likes to plow 10 inches deep for corn, potatoes and all crops "to make a good seed bed and bury weeds and grass." He fits with a conventional disc and leveling harrow.

Ellsworth Vonia at Corfu in Genesee County, New York, follows the same fitting procedure as Mr. Badger, but claims that 5 to 6 inches is deep enough to plow in the clay loam he has. Incidentally, Mr. Vonia has only 31 acres of land and 26 head of stock, but had to buy only \$42 worth of roughage last year. For five months, ending October 15, 1948, his 18 milkers, out on pasture with his heifers, averaged 1,000 pounds a month without any barn feeding other than grain.

Shaves Subsoil

Another who leans toward deeper plowing is Jacob Miller, who has a 235-acre dairy farm at Lockport, New York. His land is heavy clay with a clay bottom that is almost waterproof. He plows to the depth of his topsoil, 8 to 10 inches, and occasionally turns over a thin shave of clay. He believes that water may leave valuable plant food next to the clay subsoil that should be turned up to be of use to the next crop. He says: "The clay bottom provides little under-drainage so we have to keep the land crowned and ditched out in order that the water may drain off. We have never used any tools other than plow, roller, cultipacker, disk and drag harrow. I think our soil is too heavy for a rototiller. To be sure of any crop you must first have a good plowing job."

Over in Madison County, New York, Elbert R. Reeder of Hamilton says he thinks a rototiller is good. He also says he has a fair degree of success working up stubble for grain crops with either spring tooth or disk harrow. He plows 8 inches for sod, goes over it enough times with a spring tooth to insure depth and mellowness, but finds that he occasionally has to use a planker or other lump crusher. Victor E. Close of Brookfield Center, Connecticut, always

Bargaining Agency Holds 13th Annual Session

THE DELEGATES to the 13th annual meeting of the Metropolitan Cooperative Milk Producers Bargaining Agency, Inc. at Syracuse:

1. **Pledged** the Agency to continue to fight for equality of income for farmers through their own efforts and their own cooperative associations.

2. **Resolved** to support such prices for Class III milk as will ensure a market for all milk from all the producers in the New York milk shed and which will tend to stabilize the Class I-A price structure.

3. **Endorsed** "Milk for Health" and the school lunch program.

4. **Declared** that the manufacture or sale of margarine or other edible fats colored yellow should be prohibited by law.

5. **Urged** more intensive advertising and sales effort to increase the use of dairy products in the American diet.

6. **Objected** to trade agreements with other nations that provide for imports, at reduction in tariffs, of dairy cattle and dairy products of which we already have a surplus.

7. **Determined** to cooperate with any and all other farm groups who are willing to work with the Agency to study and attempt to solve cooperatively the economic problems which American farmers face.

8. **Empowered** the Executive Committee to take the same position at the coming hearing of the Class III pricing as it did in the January 1949 hearing.

The Bargaining Agency's position in last year's hearing was: (1) that the manufacturing allowance in the Class III formula would be compensatory in accordance with evidence of actual costs even if this resulted in an increase of the allowance; (2) that Class II-C (special cream area fluid cream) be 10 cents higher than Class III; (3) that the base price be fixed on the basis of U.S.D.A. highest New York 92 score butter quotations the year around, instead of March through July. (At present the Boston cream price is used as the base for seven months of the year.)

The Executive Committee was authorized to take the position at the hearing that the 2 cent premium in the present formula may be reduced to not less than 1 cent if, in the Committee's opinion, the hearing evidence justifies such reduction.

Young Elected President

James A. Young of Angelica, N. Y., was elected President of the Agency at the organization meeting of the 1950 Board of Directors. Mr. Young, a well-known dairyman of Allegany County, represents the Konhokton Milk Producers Cooperative Association Inc. of Cohocton, N. Y. Other officers, all re-elected, were: Leon A. Chapin, North Bangor, N. Y., vice president; A. D. Hakes, Pitcher, N. Y., secretary; G. Lester Dumont, Malone, N. Y., treasurer.

Ernest Hartley of Osceola, Pa., was elected to the Board of Directors for one year to fill the vacancy caused by the death of the Agency president, Frank E. Snyder of Liberty, Pa. Other directors elected or re-elected to full three year terms were: E. C. Bardin, West Winfield, N. Y.; L. J. Stammer, Gouverneur, N. Y.; Stanley C. Benham, Millbrook, N. Y.; George Chamberlain, Ellisburg, N. Y.; G. Lester Dumont, Malone, N. Y.; A. J. Ellsworth, South Montrose, Pa.; Ernest Hard, Manchester Depot, Vt.; Harold Woodward, Wellsburg, N. Y.; T. C. LaPorte, Ellenburg Depot, N. Y.; Robert Nelson, Dolgeville, N. Y.

Charles H. Baldwin was reappointed

executive secretary to carry out established policies of the Bargaining Agency, to see that each of the 52 cooperative organizations in the Agency are kept informed of what is being done or is to be done "to provide orderly marketing of all milk and to assure the efficient farmers a living price for milk."

Leon A. Chapin, vice-president of the Agency and president of the Dairy-men's League, presided at the morning session and keynoted the theme of the Forum panel on "Surplus Milk" arranged by Secretary Baldwin for the afternoon session. "Too many of us have forgotten that when this Agency was started, surplus milk was flooding fluid markets, breaking down prices, and finally bringing thousands of farms to the verge of bankruptcy," Chapin declared. "We now have a surplus of milk over and above what the fluid markets require. It's time to face facts. We must align farmers' support for a program that will protect all dairymen from a disastrous breakdown of the whole milk-pricing structure."

Surplus Milk Forum

During the Forum on "Surplus Milk" the 300 delegates and members heard from: Dr. Harry P. Young, Agency economist; E. A. Pool, assistant manager, Dairymen's League sales department; Dr. E. E. Vial, economist, Milk Dealers Ass'n of Metropolitan New York; Jacob R. Pratt, president of Milk For Health; and two Cornell University authorities, Dr. Kenneth L. Turk, head of animal husbandry department, and Dr. L. C. Cunningham, professor of farm management. Fred A. Sexauer, former League president, was moderator.

Dr. Vial pointed out that with the end of butter rationing, the decline of the use of pool milk as a source of fat for ice cream was phenomenal, dropping from 71% in 1943 to 43% in 1948. He said that re-pricing last spring reversed the trend by bringing the margin of cost of milk for ice cream to only 14c more than the cost of milk for butter. It had been 60c from 1941 to 1948. In 1948, 5½ pounds of pooled milk was used per gallon of ice cream, and in 1949 this increased to 12½ pounds and the pool regained the dominant position as the source of fat.

Mr. Pool emphasized under-consumption, rather than over-production, and Mr. Pratt agreed and pointed out that other areas have forged ahead of New York in increasing consumption. "From 1941 to 1946 consumption in Connecticut increased 51%; in Pittsburgh, 47%; and in Philadelphia, 60%," Pratt said. "During this time the increase in New York was only 27%. In these same years, Connecticut's population only increased 9% and New York's 20%." He attributed the increased consumption in these areas to the establishment in them of American Dairy Association and National Dairy Councils. "If we had similar councils in New York, we'd be selling 50 million more pounds of Class I milk," he declared.

Dr. Turk claims that "the adoption of sound culling, feeding, and breeding practices in herd management on a greater number of farms will bring lower costs, a lower selling price and the consumption of more milk." He feels that there is often over-emphasis on marketing as a cure-all for dairy-men's troubles and that more could be gained if under practical farm conditions, with cows milked twice daily, producers aimed for goals of 11,000 to 12,000 pounds of milk annually from Holsteins, Brown Swiss, and Ayrshires

(Continued on Page 19)

ACTIVATE THE FEED at new LOW COST

Feed-to-milk
conversion
holds the secret

Sluggish digestion or assimilation will undo the best of feeding... but good feed and roughage seldom prove to be "high cost" if the productive vigor of the animal is constantly kept at a high level.

New LOW COST Supplement

The new economy Drum of Kow-Kare is real NEWS for owners of medium-to-large herds. It brings down the cost from 49¢ to 33¢ a pound for a build-up that supplies Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D in this famed tonic-supplement. No excuse now to deny your hard-driven producers this invigorating aid. A week-a-month Kow-Kare program suffices in most cases. Freshening cows thrive best if fed Kow-Kare for a month before calving.

A SPOONFUL PACKS A WALLOP

M-M Power Units

Frick 27" and 32" Edgers

Frick 20' Steel Trimmers

Frick Sawmills,
Built in 4 Sizes

SAWMILLS AND EQUIPMENT

Are designed to cut and trim the most accurate lumber and do it most rapidly, because they are precision machines. Timken and Hyatt roller bearings, adjustable carriage trucks without end play, set-works accurate to 1/32", cut steel adjustable rack bars and similar features make Frick Sawmills the choice of sawyers and owners alike.

Square-edged lumber means bigger profits. For this operation we suggest the Frick all-steel edger, built in two sizes, 27 and 32 inch, with 2 or 3 saws. Frick all-steel trimmers are built with 2 saws, are 20 ft. long and are of welded construction.

Minneapolis-Moline Power Units or heavy-duty tractors are ideal drives for this equipment.

FAGLEY SEED CO., Box 161, Archbold, Ohio

The Question Box

Is it a fact that Clinton and Mohawk oats are losing their disease resistance?

It is not so much a question of losing disease resistance as it is of being subject to a relatively new rust, or at least a rust which has not given much trouble until recent years.

The search continues for better oat varieties.

Is there a better barley than Wisconsin "38" to grow along with oats?

There is a new variety from which some seed will be available this spring. It is called "Moore." Some tests have shown that it out-yields both Alpha and Wisconsin "38."

It is a smooth-awned spring barley which matures about the same time as Wisconsin "38". However, it does have a stiffer straw.

We would like information on churning butter. The product we get lacks firmness. If more people knew how to make good butter, oleo would be no competitor on the farm.

Failure to control temperature is probably the chief cause of poor butter. Here are a few hints that may help. There are two ways to handle cream. One is to pasteurize it at 145° to 150° F. for 30 minutes, then cool it to 50° or lower and churn it the next

morning. The other procedure is to hold it at 60° to 75° F. for 12 to 16 hours to ripen. When the cream is mildly sour, cool it at 48° to 50° in summer or 50° to 55° in winter. Hold it there for 2 or 3 hours and then churn it.

During churning, when the butter granules are half the size of a kernel of corn (which ordinarily would take from 20 to 35 minutes) draw off the buttermilk and add an equal amount of water at the same temperature and operate the churn for about 2 minutes. Then drain, salt, and work.

How much plant food must a fertilizer have before it is rated a "high analysis"?

20%. For example, a 5-10-5 will just get under the wire.

I have a swamp and would like to sell peat moss from it. I would appreciate any information you can give.

Usually peat moss is marketed by large concerns, partially because the equipment needed is pretty expensive unless one is in business in a large way.

If any reader has had experience in taking peat from a swamp to use on his own farm or to sell to nearby neighbors or to market commercially, we would appreciate any information so that we can pass it along to other readers.

FARM PROSPECTS IN 1950 (Continued from Page 5)

ing more products, you do so by following your products closer to the consumer. In other words, you perform some of the marketing services which you normally would hire done. An excellent example would be selling eggs direct to the consumer, either at his door or at a roadside stand.

6. Consider outside means of increasing your income. These may include doing more custom work on farms of your neighbors. It might include some part-time outside job.

7. Support your farm organizations. As our whole economy, including agriculture, becomes more complex, organizations become more essential. Through them, farmers can accomplish what they cannot possibly accomplish alone.

8. Keep informed. This can be done by reading a farm paper such as *American Agriculturist*, keeping in touch with farm organizations and attending meetings.

9. Order farm supplies early. One shortage that you are certain to run into is in some grass and legume seeds. The total supply of these seeds is 11% below average, and prices will certainly be higher than they were a year ago. Timothy seed is unusually short; alfalfa is more nearly adequate; red clover supply is about 25% below last year; Ladino and birdsfoot trefoil are in fair supply but will not meet the heavy demand.

Fertilizer will be more plentiful than it has been in recent years, but there is still a possibility that you will run into a shortage of some materials if you wait until planting time before ordering.

Here are a few further suggestions which apply to particular enterprises:

DAIRYMEN can well consider further improvement of roughage and pastures; give unusual attention to be sure that only the best heifer calves are raised.

FRUIT GROWERS should make new plantings with caution and should be absolutely certain that the soil and location for new plantings are favorable.

Particularly with apples, it would appear that merchandising, such as performed by the New York and New England Apple Institute, could, if well supported, bring unusually high dividends.

Nineteen-fifty will be another year when careful planning will pay dividends. In general, operate conservatively, watch debts, cut costs and be ready to make quick changes to meet new conditions.

POTATO GROWERS will need to reduce further the production cost per bushel and to develop dependable markets.

POULTRYMEN will find that top-quality chicks are an even better investment than usual, that early pullets (started before February 1) will be most profitable, and that reliable market outlets will become more important.

— A. A. —

CORRECTION

Allis-Chalmers

WD

**demonstrates
new
earth-gripping
traction**

More than any development since Allis-Chalmers introduced the first tractor with rubber tires in 1932, the hydraulic Traction Booster increases the usefulness and pulling power of the farm tractor.

Its 4-cylinder hydraulic pump mechanism automatically shifts weight to the rear wheels as the load increases. The WD's quick-mounted plow, with two full 16-inch bottoms at your control, bites deep and stays deep. Mounted listers are also operated by the WD hydraulic Traction Booster system.

The WD actually gives new meaning to the word "tractor." Not only does it pull...the WD boosts traction when you need it. Adjusts its own rear wheel spacing with engine power. Lifts and lowers implements. Operates power take-off and belt-driven machines...and through its new two-clutch system, controls the power take-off driven machines independent of forward travel.

Here is down-to-earth power for your family farm. *It's years ahead. It's priced sensibly. It's Allis-Chalmers!*

RELAX!

ORDER HALL BROTHERS SEX-LINKED HALLCROSS PULLETS

You almost automatically help yourself to bigger egg money when you order Sex-Linked Hallcross Pullets ... and here's why! Sex-Linked Hallcross pullets have proved themselves without any question as consistent high egg producers. They hold the all-time high record for Crossbreds both for pen and for individual birds. At the Maine Egg Laying Contest, the Sex-Linked Hallcross Pullet pen laid 16.11 more eggs per hen than the average of all pullets entered in the standard test.

And here's something that really puts the bite in these record figures and shows that you will get the same high results! The Sex-Linked Hallcross pullets that established these records were not special hand-picked birds; they were "run of the mill" chicks ... the same as we ship to our customers every day ... no pedigrees, no records — only brief trapnesting.

Does it make sense to order anything else when these proved winners are available?

ORDER SEX-LINKED HALLCROSS PULLETS RIGHT NOW!

We hatch chicks from 6 PURE-BREEDS and 4 HALLCROSS ... every chick with a bred-in profit record of proved layers on both sides. 10,000 Hall customers every year expect and get more eggs and more profits.

See your Hall dealer today or write direct for catalog and prices.

AUTOMATIC MASH FEEDERS

By L. E. WEAVER

AUTOMATIC mash feeders have come into use in a hurry. They were almost unknown two years ago, and yet in October I had a letter from Gil Eddy, the genial agent who sells one of the numerous makes of automatic feeders, and up to that time he had sold 53. I am sure that agents for other makes have been making sales also, so that by this time a lot of people here in the Northeast have had a good chance to try them out.

How are they working out? I have talked with perhaps five or six users, and have found them all well pleased

KEEP YOUR SUBSCRIPTION TO AMERICAN AGRICULTURIST RENEWED

with results. Some were enthusiastic, but the others, it seemed to me, were inclined to wait a little longer to see what might happen before giving an unqualified endorsement. Of course you can always find a few flaws if you are looking for them, and I heard about them too, but nothing very serious. If any readers have found something in the way of "don'ts" and "do's" or short cuts that save time or tempers, and would like to pass them on to others, we can put them in this column if you will send them to us.

Now I would like to put in a quotation from that letter from Gilbert Eddy:

"You mention that on hens they ate no more, died no more and body weight was the same and eggs were the same. But Lee, you left out on the feed saving. Glenn Bressler said on broilers he saved one-third pound on a one-pound bird, or one pound of feed on a three-pound bird. So feed at 5c per pound on 10,000 birds would save him \$500 plus time and labor saving."

Glenn Bressler is the man from Penn State who ran a lot of tests with automatic feeders and told us about his results last summer at the poultrymen's get-together at Cornell.

— A. A. —

HOW TO KEEP YOUR EGG CELLAR DAMP

The biggest factor in maintaining egg quality is relative humidity. What is relative humidity? Well, for our purpose, it is just the amount of moisture in the air at a given temperature. It is measured in per cent. For the storage of eggs, it is ideal to have a relative humidity of 75 per cent.

How can we obtain a relative humidity of 75 per cent? There are about three different ways we can provide the proper amount. The simplest and least expensive way is to just dump water on the egg cellar floor. This does the job but is somewhat messy. Some sort of rack has to be placed on the floor to keep cases out of the water.

Another method would be to provide a sprinkling system along the wall. This can be done by drilling holes about every three inches in a pipe. The pipe should be placed along the wall near the ceiling. As water runs through the pipe, it would trickle out the holes and run down the wall. A wet wall would give ample evaporating surface.

A third way to provide 75 per cent humidity would be to install an automatic humidifier. They are somewhat costly but do a nice job. Some poultrymen have taken humidifiers from discarded incubators and installed them in their egg cellars. They do a good job and the cost is very low.

—R. C. Baker

— A. A. —

Dry litter, protected waterers, screened roosts, and good ventilation of poultry buildings are important in keeping coccidiosis under control.

SUNNYBROOK

... the Finest that money can buy

This is our 30th year in the business of raising baby chicks. Despite wars and depressions, each year has been better than the year before. Today, we can truthfully say, there are no finer baby chicks on the market—regardless of price—than Sunnybrook Chicks. Our customers say it is amazing what exceptionally high quality chicks we produce at such low prices. That is one reason why

Sunnybrook Baby Chicks are the outstanding buy for 1950. Why take any more chances? Do as thousands are doing right now—buy Sunnybrook Chicks and play safe. Send us your order today to insure delivery on the date you want them. Let us send you our latest picture folder—it tells the story of Sunnybrook without a lot of unnecessary reading. Drop us a card or phone us. Do it now!!

1950 HIGH EFFICIENCY FEED for Faster Growth...Greater Economy

Beacon Poultry Research Farm photo showing an experimental group of chicks under a new type of radiant brooder being tested.

Better Feathering Too, With BEACON COMPLETE STARTER

Those first few weeks are all-important. That's why so many poultrymen insist on the Star Package—Beacon Complete Starter. It will help your chicks have better feathering—does not promote cannibalism—and builds hard flesh along the keel and on the breast. That's because Beacon Complete Starter is a proven formula which helps build big bodies and sturdy legs. Has high biological efficiency—guaranteed not less than 25% protein—not more than 4½% fibre. It's an economical ration, too—takes less 1950 Beacon Starter to produce A-1 results.

WHAT ONE BEACON USER SAYS...

Records show that 9 to 12 week old birds of many Beacon users average less than 3 pounds of feed per pound of meat at weights of 4 pounds and over, per bird. For instance: Beacon user Harold C. Wilson of Lewes, Delaware, writes, "Our pounds of feed were 2.80 per pound of meat. We have been using Beacon Feed ever since we started growing chickens and think there is no better feed on the market."

AFTER BEACON STARTER...

After Beacon Complete Starter has produced its fine results—keep up the all-star performance. For BROILERS make it Beacon Broiler Feed at 6 weeks. For future LAYERS, add grain at 7 weeks (50-50 grain and mash at 8-9 weeks)—and the Beacon 70/30 Feeding Plan after the 12th week.

Reach for the ★ ★ ★ Stars at your Beacon Dealer's. (Green stars on Sulfaquinoxaline feed bags.)

How to Use Poultry Disease Laboratories

By P. P. LEVINE

THE decentralization of poultry disease diagnostic facilities in the last three years has made New York State one of the foremost in the country from the standpoint of speedy diagnoses in poultry flocks. There are still a considerable number of New York poultrymen who are not familiar with the services that are rendered by these laboratories. For the information of such people the following facts are recorded:

Location

At the present time there are four poultry disease laboratories in operation in different parts of the state. One laboratory is located at East Aurora, N. Y., in Erie County (telephone East Aurora 1265). Dr. Saul Narotsky is in charge. The second laboratory is at Ithaca, N. Y., in Tompkins County, at the Veterinary College (telephone Ithaca 43211, extension 3936) under the direction of Dr. P. P. Levine. A third laboratory is located at 88-90 Prince St., Kingston, N. Y., in Ulster County (telephone Kingston 3415). Dr. C. I. Angstrom is the pathologist in charge. The fourth laboratory is in Farmingdale, Long Island, N. Y., under the direction of Dr. K. F. Hilbert (telephone Farmingdale 21).

A fifth laboratory is under construction at the present time and will be ready in about two months. This new laboratory is being located in Oneonta, N. Y., Otsego County. Dr. Anthony Sylstra will be in charge.

Purposes

Briefly, the functions of these laboratories are three-fold: first, they make diagnoses of poultry diseases on material submitted for examination; second, the laboratory serves as a center for disseminating information on the control of poultry diseases in the area. This is done through the local press, radio, leaflets, letters, and by participation of the pathologist in extension meetings held in cooperation with the county agents. The third purpose of these laboratories is to serve as a means for the testing of disease-control procedures in the field. The pathologists in these laboratories are equipped with cars so that in event of an emergency or some unusual situation, a trip to the trouble zone could be made by the pathologist.

Sending Specimens

The greatest benefits will be derived from these laboratories only if they are used properly. For instance, if a poultryman contemplates making a trip to the laboratory with specimens, he should telephone before he leaves his farm to see whether the pathologist will be in at the time he arrives and to find out what material he should bring with

(Continued from Opposite Page)

him. Bringing specimens to the laboratory in a car is the best possible way of submitting material for diagnosis. The pathologist then can confer with the poultryman and get all of the essential points in the history of the case.

If a trip to the laboratory is impossible, then specimens may be shipped to the laboratory. Typically-affected live birds should be shipped to the laboratory express prepaid. Various types of containers may be used, including crates, cartons that have been properly ventilated, orange boxes, and similar types of shipping containers. At least two or three live birds should be included in every shipment. At the same time a letter should accompany the shipment outlining in detail the history of the case. This should include the number in the flock, the age of the birds, the time when the disease first appeared, the mortality or the number of birds sick, the symptoms of the sick birds, effect on egg production, rapidity of spread, and any other pertinent information. Of special importance at this time is to include information on whether birds have been vaccinated against Newcastle disease and pox and laryngo tracheitis or have been immunized against infectious bronchitis.

Condition

If it is impossible to send live birds because of the severity of the disease, then birds that have just died could be sent provided that they had been chilled in a refrigerator immediately after death and packed in a container with ice and sawdust to keep them in good condition. If possible, both live and dead birds should be submitted.

Proper care in preparing and sending specimens to the laboratory will not only save time but also will enable the pathologist to make a more rapid and more accurate diagnosis. It is hoped that those persons who are as yet unaware of the existence of these laboratories and the services that are rendered will take advantage of these facilities in their own interest.

Editor's Note—The laboratories mentioned above are for the use of New York State poultrymen. However, the suggestions hold good in any state which has similar laboratories.

— A. A. —

TURKEY SHOW COMING

THE New York State Turkey Association will have its annual meeting at Hotel Syracuse on February 2 and 3 and will sponsor a dressed turkey show. There will be three classes. Class I will be full-dressed old turkeys with subdivisions for toms and hens. Class II will be full-dressed young turkeys with four subdivisions—young toms over 20 and under 20 and young hens under 13 and over 13. Class III is a fancy pack with no subdivisions.

The score card used in judging the first two classes will give emphasis to fleshing, finish and conformation, and dressing condition. In Class III, 50% of the emphasis will be put on consumer appeal of the package.

There will be cash awards of \$10, \$8, and \$6 for first, second and third prize in each subdivision. There will be rosettes for champions and beautiful plaques for grand champions. The judge will be Harry Kauffman of Pennsylvania State College.

If you have not received entry blanks, you can get them from Robert Baker, Rice Hall, Cornell University, Ithaca, New York.

While the show will doubtless be the highlight of the meeting, there will also be a top-notch program of education and entertainment. Mark the dates February 2 and 3 on your calendar and plan to attend.

— A. A. —

If you should weigh out a pound of bees and start counting them, you would probably find 4,500 or 3,500 bees in a pound package.

BABCOCK'S**HEALTHY CHICKS
MAKE GREAT LAYERS**

High All-Time Pen, Championship Class at California Test. Net Profit \$8.10 per bird over feed cost.

How do you like these birds? This is our High Pen at California this year in what California calls the "Championship Class." An entry consists of 26 pullets and the test runs 51 weeks. Here is what the official California Test final report says about this pen: **"BABCOCK LEGHORNS WIN NINTH TEST.** The Babcock Poultry Farm, Ithaca, N. Y., receives the \$400 award for winning the Ninth Test with an entry of White Leghorns showing a net income of \$8.10 per hen, laying 294.7 eggs per bird and with 100% livability. This is the highest net income of any California test year."

Note: The California test is held at Modesto, California, and is worth visiting.

Other 1948-49 Egg Laying Test winnings are:

HIGH LEGHORN PEN ALL TESTS: This pen was at Pennsylvania Test and laid 3815 eggs and 4059 points. This is the fourth time in eight years we have won high pen for all tests in the U.S. We had the four high pens at Pennsylvania.

HIGH LEGHORN PEN AT WESTERN NEW YORK: This is the third time in five years that we have won high Leghorn pen at Western New York.

HIGH LEGHORN PEN AT GEORGIA TEST: This is the third time we have won high Leghorn pen at the Georgia Test.

HIGH CONTEST PEN ALL-TIME—ALL BREEDS: Our Western New York Leghorn pen of 1944-45 still holds the all-time world record, 4057 eggs and 4336.25 points, for all breeds all tests.

SEND FOR FREE CATALOG which describes our stock in detail. We hatch baby chicks the year around. Besides White Leghorns we produce good Red-Rock Cross, Rhode Island Reds and Barred Rocks. We do not sell started chicks or grown pullets.

VISITORS WELCOME: We own two hatcheries here and three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

This is a cut of the Poultry Tribune Trophy which we have just won for the first time. We had twelve pens of White Leghorns entered in Official tests for 1948-49 and they averaged 273.50 eggs and 287.90 points—a new high record set for the trophy. This trophy is annually awarded by Poultry Tribune to the breeder having the highest number of points per bird for all birds of one breed entered. All breeders having five pens or more in one breed compete for this trophy. We believe this is the highest honor a breeder can win.

DOWN THE
Alley

By J. F. "Doc" ROBERTS

PRESENT prices of livestock and milk make good food the "Buy of the Season." Reports say that the buying power of the public is only 2% less than a year ago, and that more people are employed than ever before. Wall Street is having an "up" market, and steel is going up along with a good many other things, including the transportation costs of the food we raise.

Hogs are off almost 40% from a year ago, cattle and milk products almost 20%, and lambs about 10%. Farmers are furnishing these finest of all foods in abundance at these sharply reduced prices without strikes, slow-downs or pensions. The further irony of the situation is that the quality of the meat and milk has consistently improved with these lower prices, making them the lowest-cost necessity that people can buy.

Exports Lower
Some are saying, "Why not export a lot of this food?" Our exports have fallen off to almost nothing, while two or three years ago we were exporting millions of pounds of livestock products. I do not believe we should cry over this for I can see no good reason why we should give away millions of pounds of fats, for example, and then tax farmers to pay for it. I hear that fats are as big a drug on the market in Germany today as they are here.

Reversing the picture, I can see no reason why the lowest priced articles in produce (foods) should be allowed in here through tariff advantages and currency devaluation of other countries. If we must have world trade, why not have it on some of the high-cost products farmers must buy instead of the low-cost products they must produce?

We can produce livestock to sell at a price the consumer can pay and use in abundance. Hogs at a price reduction of 40% from a year ago, or roughly 16c a pound alive, can be produced profitably by our farmers. Dairy cows, heifers, steers or lambs at present prices are still good property for our northeastern farmers.

More "Allure"
It now seems that our one big problem is to sell more and more people on spending their money for better food and more of it. When advertising and merchandising of foods are built up to be as alluring as in the case of whiskey, and when prices and values and health reports of doctors are broadcast for meats and milk as they are for cigarettes, then we can expect food consumption and production more nearly to balance each other, and then we can say that food is produced by

WANTED!
I am very desirous of borrowing for a short time old-time diaries giving day by day account of farm life or village life just before, during and after the Civil War. I am sure that among our readers there must be a number of such old documents. If you could loan them to me I will, of course, take special care of them and return them as soon as I have had an opportunity to read them.
Can you help me out?
—E. R. Eastman

men of distinction and that there is not a stomach-ache in a carload.
The week of Dec. 5 saw the heaviest marketings of hogs since 1944. The next week's numbers were almost as great. Hog men have marketed huge numbers of hogs more orderly than ever before. I think it fair to guess that hogs have almost hit their low time, that cows for meat have probably seen their low time, and that good steers and lambs will have to get more nearly in line with other meats. The people have proved that they will buy what they want to eat, regardless of cost, if they have the money. Since all reports indicate that they have the money and will continue to have it into 1950, this makes any prediction purely guesswork.
With so many encouraging reports from industry and labor, and regardless of our political situation, it would seem that 1950 would be a better year for our northeastern farmers than 1949.

— A. A. —
WHAT DO YOU THINK ?

(Continued from Page 10)
plows except when he fall seeds alfalfa or clover. He says: "In sowing alfalfa or clover in the fall I like to have only the top 2 or 3 inches worked up just enough to cover seed good. After seeding, I roll and pack as hard as I can. I think this helps conserve moisture, so much needed at this time of year."

W. S. Massie plows 8 to 9 inches in the heavy clay of the 1,000 acre farm he manages at Coxsackie, New York, and likes to turn up just a little of the subsoil. They have 7 tractors to power the work in 100 acres each of corn, wheat and pasture, 200 acres of hay, 40 of orchard and 60 of garden. Fitting is done with disk, harrow and pulverizer, but Mr. Massie believes the best way to fit land is with a rototiller. They are starting to do some subsoiling and would like any information on it that subscribers could pass along.

Harry A. Ellsworth of Farmington, Maine, plows 7 to 8 inches, saying: "If you don't plow too deep, you haven't so much loose soil to mix your fertilizer and lime with." On the other hand, Claude Weber of North Collins, New York, seeds corn 8 to 9 inches for better rooting. He wonders if a disk plow would work in his Erie County area. L. J. Lee of Elkland, Pennsylvania, also favors the 7 and 8 inch depth.

It's great to have all these ideas to chew over this winter. We plan to follow these farm opinions soon with plowing and fitting recommendations from various Northeast agricultural colleges, but in the meantime how deep do you think we should plow and how should we fit land?

— A. A. —
BARGAINING AGENCY

(Continued from Page 13)
and 9,000 pounds for Guernseys and Jerseys.

Mr. Young illustrated the necessity of getting a higher price for Class I milk when larger than normal percentages are used in lower price classes. Dr. Cunningham said the rate of highest milk production per cow is in the Valley and Lower Hudson regions of the state where the average crop yields have been the highest. He claims it's only in these two regions that farmers can afford to produce year-round surpluses. He said that surplus milk facilities are necessary adjuncts of the fluid milk business for handling seasonal if not periodic surpluses.

It was reported that the 52 cooperatives in the Bargaining Agency now represent 22,548 producers.—A.J.H.

— A. A. —
Corn is the number one grain crop of the nation, covering about one out of every four acres planted.

\$25.00 FRAUD REWARD — American Agriculturist will pay \$25.00 for evidence leading to the arrest, conviction and imprisonment for at least 30 days of any person or persons who defraud or attempt to defraud on the premises of an AMERICAN AGRICULTURIST subscriber who has Protective Service Bureau Sign posted on his premises at the time such fraud is committed. Claim for the reward must be made promptly, not later than the date of conviction. Reward does NOT apply to conviction for theft. (A special temporary reward with the same rules is now offered where cattle or chicken thieves are convicted.)

American Agriculturist guarantees fair treatment of subscribers by advertisers. We refuse many ads known to be unreliable but if a fraud slips in, you are protected. To take advantage of guarantee, subscribers must say, "I saw your ad in American Agriculturist," when writing to advertisers, and then report unfair treatment promptly to Service Bureau.

APPETITE TEASERS

By LOUISE PRICE BELL

< Sliced glazed apples are a simple but delicious dessert.

▼ A "Surprise Loaf", made of cornmeal or cream of wheat and link sausage, actually does surprise — and please — the family! Baked apples are a good accompaniment.

—Photos, Bell-Tucson

WHETHER it is for breakfast or for lunch or light supper, if you plan a tempting meal—something different and served in an attractive way—you are sure to please the family. For the first meal of the day here are two recipes that are interesting and different:

HAM AND BACON STACKS

Cut pieces of cooked ham in rounds about the size of a pineapple ring. Place pineapple ring over the ham and "tie" the two together with two uncooked bacon strips. Pin ends of bacon on top with a toothpick. Broil very slowly so that the bacon on the bottom will be done. Garnish the plate with extra slices of broiled bacon for the men in the family. Finish the meal with coffee cake and coffee or milk.

SURPRISE LOAF

The surprise is the link sausage running lengthwise through the center of the loaf, which is made of cream of wheat or cornmeal. Chill well before slicing. Fry slices until golden brown and serve with sirup or honey. For an extra treat, serve baked apples.

CHILI CON CARNE

For those nippy days calling for hot supper dishes, chili con carne steps to the front. But this time it's a chili with a different twist. Made like a stew instead of the usual soup-like mixture, it's a recipe dug from the favorites of an old chef. You'll need

1/4 cup fat	1 No. 2 1/2 can tomatoes
2 pounds cubed beef	1 No. 2 1/2 can kidney beans
1 bunch celery	
3 medium green peppers	1/4 teaspoon pepper
8 medium onions	1/2 teaspoon salt
	2 teaspoons chili powder

Brown the meat, chopped onions, chopped celery and chopped peppers in the hot fat. Transfer to a large kettle

and add tomatoes, salt, pepper and chili powder. Add hot water barely to cover meat, cover kettle and let mixture simmer 2 to 3 hours. Add drained kidney beans and extra salt and chili powder to suit the taste. Serves 6.

BAKED BACON SQUARES AND BEANS

1 quart navy beans	1 tablespoon salt
1 1/2 pounds bacon squares	3 tablespoons sugar
1 cup boiling water	1 teaspoon mustard
	1/3 cup molasses

Soak beans overnight in cold water. Drain and cover with 2 quarts fresh water. Cook slowly for 1 to 1 1/2 hours or until skins burst readily when a bean is removed from the water and blown upon. Put in a large baking dish. Pour boiling water over bacon squares,

scrape rind until white, cut into 1-inch squares and press in the top of the beans. Or, if you prefer, just cut the square into several larger pieces and lay on top of the beans. Cover the dish and bake 6 to 8 hours in a slow oven (250 degrees F.). Add hot water as needed. During the last hour of baking, uncover to brown. Serves 12.

OXTAIL SOUP

1 pound oxtails	3 allspice berries
1 1/2 teaspoons salt	1 cup water
1/8 teaspoon pepper	1 cup diced carrots
1 tablespoon flour	1 cup shredded cabbage
2 tablespoons lard	1/4 cup minced onion

Cut oxtails into small pieces, sprinkle with salt and pepper and roll in flour. Brown in hot lard in a deep heavy

FRANKFURTER SUPPER SALAD

2 cups thinly sliced frankfurters	3 tablespoons finely chopped green pepper
2 cups cooked macaroni (1 cup uncooked)	2 tablespoons grated onion
1 cup sliced celery	2 tablespoons chopped parsley
1/2 cup diced cucumbers	1/2 teaspoon celery seed
2 hard-cooked eggs	1 teaspoon salt
	1/8 teaspoon pepper

Pour a little sharp French dressing over the frankfurters and let them marinate in it for a half hour or more. Add macaroni, diced eggs, vegetables, seasonings and enough salad dressing or mayonnaise to moisten. Garnish with salad greens and a colorful center of a radish rose and carrot slice on a tiny bed of parsley.

MEAT SHORTCAKE

Ham 'n biscuits made the dandiest, most delicious shortcake ever tasted—and send us off on a series of ideas for other left-over meals. Try giant-sized biscuits; if you don't have ham, try sliced veal, beef or pork or with frizzled dried beef, crisp bacon or fried pork slices and top generously with old-fashioned milk gravy.

SLICED GLAZED APPLES

For a light dessert for any one of these meals, nothing could be tastier than sliced glazed apples. Slice unpeeled red apples into a long baking dish; dot with butter and cover with a thin layer of brown sugar. Sprinkle with cinnamon. Bake at 375 degrees F. for about 20 minutes. Serve plain or with top milk or whipped cream.

Snowy Afternoon

By Edith Shaw Butler

I'll spread the cloth
And brew some tea,
A cup for you,
A cup for me.
The hearth fire burns
With a ruddy glow;
The winter miles
Are white with snow.
It's just the day
To drink hot tea,
A cup for you,
A cup for me,
With apple jelly
And fresh-baked bread.
Shall we fold the hands
And bow the head?
In thanks to God
For roof and fire,
And love enough
For the heart's desire.

AFRICAN VIOLETS

THE AFRICAN Violet apparently withstands the subdued light and rather dry atmosphere of the average house much better than most plants; in fact, it prefers a northern or north-western exposure with steady light, but not direct sunlight.

There are quite a few variations in African Violets. A friend of mine has ten different colors, from deep purple to blue, amethyst, pink, white and topaz; they also come in singles and doubles.

You know, the African Violet is a plant that the housewife can really grow better than the professional greenhouse grower. I have several friends who are very successful with

African Violets, so I asked them the secret of their success. This is a summary of their methods. First, the soil of one successful grower is made up of sand, peat, leaf mold, and ordinary soil. This woman uses about 1/6 finely-ground peat moss, 1/6 sand, 1/3 soil, and 1/3 leaf mold. The leaf mold consists of leaves which have decayed for four or five years.

The propagation of this plant is interesting. The leaves are placed in a glass of water. The top of the glass is covered over by a piece of paper, a hole is made, and the stem of the leaf is pushed down through the hole into the water. It will start rooting in about 10 to 15 days, and is then transplanted into the soil mixture mentioned above.

It takes this plant from 10 to 11 months to flower.

The feeding is also interesting. My friend dissolves a teaspoonful of Vigoro in a quart of water, and waters each plant lightly with this mixture about once every six or eight weeks. Another woman who has excellent success puts a teaspoonful of bone meal in the saucer, and renews this about once every two months. When she does, she washes out the old bone meal.

Both women are very successful in growing thrifty, healthy-looking, sturdy plants. The plants are watered about two times a week, being careful that the water has the same temperature of the room, and to apply it in such a way as not to wet the foliage.

Holding the winning plate of cookies which won her a slew of valuable prizes, including a Steinhorst home freezer, Mrs. Stuart Germond of Marcy, N. Y., receives the congratulations of Mrs. David Mabie, retiring chairman of the State Grange Service and Hospitality Committee.

Mrs. Germond, Oneida County, N.Y., Wins Grange Cookie Contest

N O OTHER event on the program of the State Grange annual meeting at Rochester aroused more interest than the wind-up of the statewide sugar cookie contest, in which more than 4,000 Grangers had participated since last spring. The contest, the fourteenth of its kind to be sponsored by the New York State Grange and *American Agriculturist*, was a project of the State Grange Service and Hospitality Committee.

Fifty-two county winners entered the finals, and all entries of cookies arrived in time for the judging, which began at 10 o'clock on the second day of the convention. Though some came by mail, they were so carefully packed that not a cookie was broken!

Three Home Economics experts worked several hours to score the cookies, and when the sealed envelopes containing contestants' names were opened, it was revealed that the top winner was Mrs. Stuart Germond of Marcy, Oneida County, N. Y. Scores were so close that the second prize winner, Mrs. Tremain Moyer of Canajoharie, Montgomery County, N. Y., was within half a point of Mrs. Germond.

The judges of the contest were: Christine Schamel, Home Economics Department, Rochester Board of Education; Irene Muntz, Home Department of Rochester Gas and Electric Co.; and Lillian Shaben, Food and Nutrition Dept., Cornell University. A complete list of winners follows:

WINNER	COUNTY
1—Mrs. Stuart Germond	Oneida
2—Mrs. Tremain Moyer	Montgomery
3—Mrs. Fred E. Bartlett	Oswego
4—Mrs. Cora Hill	Cattaraugus
5—Miss Doris Le Buis	Albany
6—Mrs. Dorothy Clark	Tioga
7—Mrs. Howard Barrett	Saratoga
8—Mrs. Mary Kelly	Greene
9—Mrs. Clarence Sayles	Columbia
10—Mrs. Ada Deussenberry	Steuben
11—Mrs. Ed Harloff	Monroe
12—Mrs. Mabel VanLoon	Schuyler
13—Mrs. Ethel Webster	Otsego
14—Mrs. Leo Ellis	Chautauqua
15—Mrs. Irving Heidenreich	Wayne
16—Mrs. Oliver Whyte	Ontario
17—Mrs. Fenton Wagar	Yates
18—Mrs. Andrew Bilow	Franklin
19—Mrs. Clayton Martindale	Warren
20—Mrs. Margaret Sheehan	St. Lawrence
21—Mrs. Raymond Stowell	Niagara
22—Mrs. Lulu Wing	Allegany
23—Mrs. Edna Gilmaier	Fulton
24—Mrs. Marie Baylor	Tompkins
25—Mrs. Ernest Raeger	Seneca
26—Mrs. E. Klein	Putnam
27—Mrs. Stanley Steiner	Westchester
	Genesee

"A Grand Surprise"

Associate Editor Hugh Cosline of *American Agriculturist*, who had the pleasant task of announcing contest

winners to the hundreds of Grangers who attended the convention, called Mrs. Germond to the platform and asked her to tell the audience what it felt like to win all the prizes awarded to her as No. 1 winner. She replied that it was a grand surprise, as she had never baked rolled sugar cookies until she entered the contest last spring.

An extremely popular spot in the convention hall was an exhibit of the winning plates of cookies—twenty-seven in all. The exhibit, prepared by the State Grange Service and Hospitality Committee, displayed signs describing all prizes to be awarded winners. In the main entrance to the hall was exhibited the handsome Steinhorst home freezer won by Mrs. Germond. More than one Granger was heard to exclaim, "Gosh, wouldn't I like to have won that!"

As top winner, Mrs. Germond won the following prizes:

\$30.00 in cash, including \$25.00 from *American Agriculturist*, a \$3.00 entry

prize from State Grange, and \$2.00 from General Foods Sales Co., Certo Division, New York City.

An 18½ cubic foot home freezer from Emil Steinhorst & Sons, Utica, N. Y.

A Domino Garden Basket containing 13 different packages of pure Domino sugar from American Sugar Refining Co., New York City.

A \$5.00 grocery certificate, a No. 2½ can Colonial Molasses, and 1 pint bottle Colonial Gem Syrup from Colonial Molasses Co., Jersey City, N. J.

A 5 lb. bag of each of the following: GLF Pancake Mix, GLF Pastry Flour and GLF Patent Flour, and a 2 lb. bag of GLF Cake Flour from Cooperative GLF Exchange, Ithaca, N. Y.

Two 10 ounce cans of Gorton's Codfish Cakes from Gorton-Pew Fisheries Co., Gloucester, Mass.

Holiday assortment carton of Kraft cheese and other Kraft products from Kraft Foods Co., Chicago, Ill.

Each of the next nine high winners received the same merchandise prizes, with the exception of the Steinhorst freezer. Also, each received a \$3.00 entry prize from State Grange, plus the following cash prizes from *American Agriculturist*:

2nd	20.00
3rd	15.00
4th	10.00
5th	5.00
6th	3.00
7th	2.00
8th	1.00
9th	1.00
10th	1.00

Contestants having the next 17 high scores received \$1.00 each from *American Agriculturist*, and they, as well as all other county winners taking part in the contest each received the \$3.00 State Grange entry prize. Altogether, the Grange awarded \$156.00 in entry prizes.

Mrs. David H. Mabie of Amsterdam, N. Y., the 1949 chairman of the State Grange Service & Hospitality Committee, had charge of the contest for the Grange. Assisting her were the other members of the committee, Mrs. John Lavery of Genesee (the 1950 chairman) and Mrs. Herbert Thomsen of Poughkeepsie. In the counties, the work of handling the contests was in charge of chairmen of all Subordinate and Pomona Service and Hospitality Committees, to whom much credit goes for the success of the contest.—Mabel Hebel.

For Women (WHO BAKE AT HOME) Only

TALKING IT OVER

SO—Buy 3 packages at a time. No refrigeration needed. It's made extra active and stays that way.

3 times as many women prefer **FLEISCHMANN'S YEAST**

WHEN... ORDINARY CORSETS WILL NOT DO!

FOR THE MEDIUM LARGE
OR HEAVY FIGURE HERE ARE
SOME IMPORTANT FACTS

Some women realize—others do not—that there is a vast difference in the purpose and design, between "an ordinary corset" and a Protective Supporting Garment with "built-in" figure control. Many women FEEL that their particular "figure problem" is so difficult, that in order to obtain proper protection—they must necessarily sacrifice style. If you are one who believes in this fallacy, may I suggest

that you write at once to W. S. Rice, Inc. Dept. 1003-R, Adams, N. Y., for revealing descriptive literature, showing garments in full color, showing garments in full color on live models. This literature which is absolutely free, will be sent postpaid in plain sealed envelope and may easily show you the way the fashionable supporting protection you have long been looking for.

Model 351, shown above, with special front development and corset back, trims your figure by gentle "uplifting" pressure that "holds up" excessive fat or heavy, sagging abdominal muscles that "ordinary corsets" can hardly be expected to control—and for post operative weakness or navel hernia, you will find Model 351 has many outstanding advantages. All in all, this extremely comfortable and dependable Supporting Garment has frequently taken "The Problem" out of a troublesome "figure" condition—and unless your condition is extremely unusual, it should do the same for you. Request for illustrations and full information puts you under no obligation whatever—so, I suggest you write to W. S. Rice, Inc. Dept. 1003-R, Adams, N. Y., without delay.

FARM FREEZER FACTS and FANCIES

CHICKEN a la king is a company dish that happens to freeze well and keep for as long as a year at zero. Besides it is such a good way to use the non-layers in the flock!

Mary Kirkpatrick and Beatrice Moutjoy of the U. S. Bureau of Nutrition and Home Economics made tests for quality of creamed chicken and the fancier version, the a la king, after 4, 8 and 12 months in storage. They found that the mixtures did not curdle, which so often happens to gravies or sauces when frozen. They also found a slight drop in the texture of the meat after 4 months storage of chicken a la king and after 8 months storage of creamed chicken. Otherwise no change from the fresh product was noted.

Here is their recipe for the chicken a la king: 6 cups diced cooked chicken (both light and dark meat); 1/2 cup chicken fat; 5 tablespoons finely cut green pepper; 3 cups canned mushrooms; 3/4 cup flour; 3 cups chicken broth; 3 cups milk; 3 teaspoons salt; 6 tablespoons canned pimiento, finely cut.

Cook mushrooms and green pepper in the fat about 5 minutes. Blend in flour, add stock, milk, seasonings. Cook over hot water until thickened. Add chicken and pimiento and blend well. Cool the mixture rapidly by setting the panful in a large container of ice water. Pack it in pint paper board containers with heat-sealing cellophane liners. Seal and freeze at zero F.; store at zero or lower.

To serve, no preliminary thawing is needed. One pint package will both thaw and heat in a double boiler in 30 minutes. This amount makes 6 pints.

—A.A.—

Sally Saves

Mrs. Ruth McMillan of Ithaca, N. Y., cans her maple syrup first, then pasteurizes it, thus eliminating the personal danger of handling boiling syrup, not to mention the chance of it boiling over on the stove. Her method is simple and easy.

Pour the syrup into clean, scalded glass jars, leaving a quarter-inch headspace. The screw-top type of jar should not be completely sealed, but the bail type should. Place jars in the canner and cover with lukewarm water. When the water reaches a good boil, turn off the heat and leave until cool before removing the jars.

Save Money On This Home Mixed Cough Syrup

Big Saving. No Cooking. So Easy.

You'll be surprised how quickly and easily you can relieve coughs due to colds, when you try this splendid recipe. It gives you about four times as much cough medicine for your money, and you'll find it truly wonderful for real relief.

Make a syrup with 2 cups of granulated sugar and one cup of water. No cooking needed. (Or you can use corn syrup or liquid honey, instead of sugar syrup.) Then put 2 1/2 ounces of Pinex (obtained from any druggist) in a pint bottle, and fill up with your syrup. This makes a full pint of medicine that will please you by its quick action. It never spoils, and tastes fine—children love it.

This simple mixture takes right hold of a cough. It loosens the phlegm, soothes the irritated membranes, quickly eases soreness and difficult breathing.

Pinex is a special compound of proven ingredients, in concentrated form, well-known for its quick action in coughs and bronchial irritations. Money refunded if it doesn't please you in every way.

A.F.B.F. Endorses Flexible Price Supports

By L. B. SKEFFINGTON

I WENT to Chicago with the New York delegation to the American Farm Bureau Association's annual meeting. About 70 persons turned up at breakfast for the delegation, so I suppose this was about the actual count of New Yorkers present.

For several days the convention atmosphere was charged with something or other, as it was generally understood that the delegates would give the Brannan Plan another kick downstairs. At the breakfast, C. C. DuMond, N. Y. State Commissioner of Agriculture and Markets, summed up the major problem facing the convention: "A lot of delegates know that high support prices will add to the surpluses of some crops which already are causing trouble. If and when these surpluses get out of hand, they will surely bring drastic acreage and marketing controls. So they believe the best policy is to reduce price supports to the point where they will not encourage surplus production."

Warren W. Hawley of Batavia, State president, said that the resolutions committee had wrestled with the problem for several days and nights. Cotton and tobacco producers, accustomed to high supports and government taking over their surplus production, just hated to give up, but they finally agreed to back a program for flexible supports.

Brannan Absent

Something of a hero at the convention was Senator Clinton P. Anderson of New Mexico, former secretary of agriculture. His successor, Charles F. Brannan, was not invited. A letter from Secretary Brannan to Allan B. Kline, federation president, was released in which he regretted that farmers at the convention would have opportunity to hear only one side of the argument about his production-payment plan. Kline immediately popped back that delegates did not need the presence of a federal official to guide their thinking, including a consideration of both sides of the problem.

It will be recalled that Anderson is the author of the farm program which is now the law. Congress threw out the Aiken law, and the administration urged the Brannan Plan. Anderson refused to go along with the latter and evolved a compromise. Kline introduced Anderson as "the great champion of the middle ground in farm legislation." He said the Anderson program included price supports at a higher level than the Farm Bureau thought justified, but it did contain the basic principles, including flexible supports, which the federation fought for.

Hawley was re-elected a director of the AFBF, and Lorenzo D. Lambson of Southwich, Mass., was elected in place of "Uncle" George Putnam of New Hampshire.

Moisture Needed

There have been moderate amounts of rain and snow upstate during the past month, but not enough to relieve the water shortage which in some sections is acute.

Normally the Barge Canal is drained early in December. The 60-mile stretch between Lockport and Rochester will not be drained until Feb. 24 because a number of villages and rural sections depend upon it for water. In a number of villages, water conservation measures are in effect and steps are being taken to increase supplies. Hauling of water for livestock is not unusual for farmers this fall and winter. As of this writing, no relief is in sight.

Fall-planted wheat and new seedings generally look good, but lacking snow cover and with only a moderate amount

of moisture in the ground many farmers are hoping for heavy snows. Following the long summer drought, many seedings picked up after rains in early September. But the generally "open" winter so far has raised some worries that the experience of a year ago may be repeated.

While milk production is up generally this fall, several herd testers have told me that they find production per cow is dropping in many herds. They speculate that this may be due to poor quality of hay found on many farms as a result of the drought.

PCA Farmer Owned

Something of a record was established when Harold Giles of Union Springs, president of the Production Credit Association of Canandaigua, handed a check to H.B. Munger, president of the Farm Credit Administration of Springfield. The check represented final repayment of the government's investment in the capital of the association.

At one time the government had an investment of \$187,000 in the association. Now all of the capital stock is owned by farmers. Outstanding stock totals \$124,000, besides which there is a reserve fund of \$123,000. The Canandaigua association is the first PCA upstate to pay in full all obligations to the government.

Santa Is Elected

Charles W. Howard of Albion has acquired national fame as Santa Claus and as dean of the Kris Kringle Kollege to which Santas from all over the country come for a course of instruction. Now he has taken on another job, as president of the Orleans County Farm and Home Bureau and 4-H Association. Years ago Howard began advocating better-trained Santas and offering advice on the subject. So many inquiries and visitors came that organization of the college and its annual training course followed.

Mrs. Harold Leininger of Kendall steps down as association president in Orleans, but Seneca County has elected Mrs. Earl Brust of Sheldrake as president, and Wayne County named Mrs. Henry Lockner of Sodus Center.

N. Y. STATE GRANGE DELEGATES OPPOSE SOCIALISTIC SCHEMES

(Continued from Page 3)
officials in planning a long-range secondary road program.

Opposing a drop of 44c a cwt. in Class I price of milk in New York City on January 1.

Urging support of "Milk for Health" program.

Opposing the coloring of butter substitutes before sale.

Recommending a change in the conservation law to permit farm employees to hunt woodchucks on employer's farm without a license.

Favoring the extermination of foxes by professional hunters and by other means established by the Conservation Department.

Opposing the separation of Farm Bureau and Extension Service in New York State.

Opposing Federal aid to education. Demanding that State, County and local fairs bar vulgar side show acts.

Proposing legislation to permit children under twelve to work on farms under proper supervision.

Expressing dissatisfaction with the administration of welfare and relief in the State and declaring that welfare should be administered at local levels.

Opposing socialized medicine.

The Grange delegates also took action to move the State Grange Session up to the month of October, beginning next fall.

THE YOUTH'S COMPANION

Left on the Isle of Sands

By CHARLES G. D. ROBERTS

FOREWORD

With this issue, we are commencing a serial story, in two parts, taken from the pages of the YOUTH'S COMPANION of October 1891. LEFT ON THE ISLE OF SANDS is a touching and thrilling tale of castaways in the New World. The excitement and suspense mount steadily to the end.

CHAPTER I

ONE MORNING, in the spring of 1598, there was strange excitement in a certain poor turf cottage on the outskirts of St. Malo, in France. In this cottage dwelt the good wife Saintine, with her two sons, Jules and Ba'tiste. With tireless labor she and her boys made a living by selling in the markets of St. Malo the products of her scanty garden plot. Her husband, Christophe Saintine, was a convict, shut up for life in the St. Malo prison. He was a powerful man, a blacksmith, and had been a good citizen until, in an evil day, his violent temper had led him to strike down a man in a street brawl.

The Marquis de la Roche, a great nobleman, was about to set forth for the wilds of New France, there to found a colony; and he had authority to select, in the French prisons, such convicts as he might deem suitable for colonists. In those days it was thought that convicts would do as well as anyone for the peopling of a new land.

On the morning on which my story opens, Jules had run home to his mother with the news that she was summoned, with her boys, to the St. Malo prison, there to bid farewell to her husband, who had been drafted by La Roche as one of the St. Malo contingent.

This little Breton city, with its vigorous and daring stock, had supplied the Marquis with nearly a third of his party; and this one morning was allowed the colonists for their leave-takings.

There were sorrowful scenes at the prison in the glaring, gray-walled, sandy yard; but in some cases the sorrow was not without consolation. Christophe Saintine had been, for all his roughness, a good husband and father, and to his family, who, as long as he was in St. Malo, could visit him from time to time, his exile to the unknown wilderness was like a sentence of death. But to himself it was far otherwise. In the New World there was hope for him. After a period of labor for the settlement, each convict whose behavior had been good would be given lands of his own, whereon to make a home for himself and for his family left beyond the sea.

The old look of hopeless dejection vanished from the blacksmith's face as he told the stories he had heard of the fertility and beauty of that New World, where gold and silver, as they assured him, might be picked up among the pebbles of the brooks.

As the good wife Saintine and her boys, their farewells said, took their reluctant way homeward to the little turf cottage in the outskirts, they were

weeping heavily, but a ray of hope had crept back into their hearts; and in the heart of Jules something else gleamed besides that ray of hope.

Jules Saintine was an active lad of fifteen. Ba'tiste was two years younger. Jules was a St. Malo boy, filled with the restless spirit of his race, and with stories of New World wonders heard from the lips of the sailors who frequented the city quays. The ship of La Roche was to sail in two days, and Jules, whose father was his hero, resolved that he would set sail with him.

He had many misgivings at the thought of leaving his mother and Ba'tiste; but his heart being set for New France, he easily deluded himself into a belief that it was a right thing to do. Ba'tiste, he argued, would be company for his mother who would be able to get along well enough; while he would be a comfort to his father in that far world of wonders.

Under the circumstances, and impelled by his restless spirit, it was not hard to persuade himself that the course on which he was bent was just the one he ought to pursue.

The night before the ship was to sail he kissed his mother and brother in their sleep, and stole away. There was a great lump in his throat, and he dashed angrily from his eyes the tears that would gather and overflow. In the confusion on the quay and on ship-board he went upon the ship without being observed, and succeeded in stowing himself away below.

At dawn the vessel was under way.

The ship was under the guidance of one Chetodel, a noted Norman pilot. Besides her crew of hardy Norman and Breton marines, she carried La Roche, a band of paid soldiers, a few voluntary colonists of broken fortune, fifty turbulent convicts, a great store of provision against famine and of baubles for trading with the savages, and hopes, fears and sorrows innumerable.

Not till the ship's wide sails had carried her beyond the last glimpse of the shores of France did the Marquis take his convicts out of irons. Even then their freedom was rigidly limited.

Then it was that Jules crept out of hiding, and trembled in uncertainty as to how he would be received.

Jules was a courageous boy, but he had little bravado or that audacity which so nearly borders on insolence. He stole shyly up to the side of a sailor whom he knew, and stood gazing in painful suspense at his own wooden shoes.

The sailor stared at him in astonishment, and gave a low whistle as the readiest expression of his surprise.

"What in the world brings you here, chicken?" he exclaimed, in a moment.

"I wanted to come with my father!" murmured the culprit, for the first time realizing his guilt.

"Your father's pretty well taken care of, I fancy," answered the sailor with a harsh laugh. Then, after a pause, he continued, "Well, to His Excellency you must go! If he says you shall be whipped, or dropped over the rail to swim ashore, that's your own lookout. I think he will have no place for boys on a venture like this!"

The feelings of Jules, on hearing this

speech from the sailor, are hardly to be described. Shuffling nervously, and trying to keep his feet on the reeling deck, he started to follow the sailor into the presence of the Marquis. His Excellency, in the full splendor of his uniform, which he made a point of wearing officially at certain hours every day, was standing on the quarter-deck, and looking backward somewhat wistfully toward the sweet shores of France.

With fright, and the first qualms of approaching seasickness, Jules was now a pitiable-looking object as the eyes of the Marquis fell upon him.

A few profoundly deferential words from the sailor, who, being boatswain, approached the commander directly, made clear the situation. It was evident that the Marquis de la Roche, now Viceroy of New France, did not want boys in his viceroyalty at this early stage in its development. At first his face was harsh, his voice like steel, as he began to rebuke the quaking boy; and Jules felt that if he got off with a terrible thrashing from the cat-o-nine-tails he would be marvelously fortunate.

Then something in the boy's face or some home thought seemed to touch the haughty nobleman.

"See to it that you are obedient and diligent, child, as all must be whose fortunes are cast upon this venture!"

With these words, which rolled a mountain off the heart of Jules, the tall Marquis made a gesture of dismissal; and the boatswain led the boy away.

After the strain was over, however, the young landsman found himself possessed by all the nameless torments of seasickness; and for a day or two, as he lay in a heap in whatever corner seemed most out of the way of the sailors' feet, he repented with all the fervor of his soul.

As he began to recover, he saw his father for the first time since the day of the farewells in the prison yard.

If Jules wanted the satisfaction of giving his father a surprise, he had every reason to be content. Christophe Saintine's first thought was that he was looking upon an apparition, sent to tell him that his son had just died

in the far-off St. Malo cottage. The superstitious Breton turned ghastly pale with awe and grief. But when he realized that it was his very son, in the flesh, who clung passionately to his hands, his delight was fervid and unrestrained.

Jules was perfectly and boyishly happy for the rest of the voyage. The boatswain impressed him into his service, and kept him reasonably busy. The boy did not object to this. It gave him a sense of importance, and made him feel like a real sailor.

Jules loved the sea instinctively. The ship was his delight; and every day he could see and talk to his father.

The wind kept fair many days in succession; and at last a low, long line of sandy shore, half veiled in surf, was sighted.

Instantly the whole ship went wild with excitement, which subsided somewhat as the wary pilot announced that the pale coast was that of the dreaded Isle of Sands.

This island, which is still called Sable Island, from the French Isle aux Sables, is the most perilous spot in the Atlantic. Even as long ago as 1598, vessels had been wrecked upon it. It has been called "the Charnel-House of North America." Its hungry sands are gorged with wrecks.

Formed by the deposits of two meeting ocean-currents, it is continually shifting, even like the eddies of the tide.

On the day when Jules espied it from the deck of the Breton ship, it was nearly forty miles in length, and was a slim crescent of pale yellow set in the gray-green seas. Now it is little more than half as long. Then, as now, it was divided almost from end to end by a shallow fresh-water lake, the windy resort of innumerable water-fowl.

As the wind was light, and blowing off the island, the pilot said that a landing might be effected without risk, and the ship cast anchor about three miles from shore. It was dangerous to go nearer on account of the intricate shoals.

The Marquis was rowed ashore, and so struck was he with the inaccessibility of the island that he resolved to make use of it as a temporary prison for his forced colonists.

His design was to leave the convicts on the island while he should explore the coasts of Acadia for a fitting place to plant his settlement. As soon as the site had been chosen and some buildings erected there which might prevent his sorry charges from betaking themselves to the woods, he would return to the island and get them. Meanwhile, in the fair June weather, and with the provisions he would leave them, he thought they would be comfortable, and he knew they would be safe.

The convicts themselves were by no means ill-pleased with this scheme, which was carried into effect without delay; and as for Jules, he had no difficulty in gaining permission from the kindly viceroy to stay upon the island with his father.

When the last boat-load had been landed through the surf and the boat had returned to the ship, and the ship had moved away with swelling sails, the hearts of those left behind sank

(Continued on Opposite Page)

The New Year

By Edith Horton

Step gallantly into
Another measured year,
And trace the seasons through
As swiftly they appear.

Let ivy cover scars
Which other years have made,
And contemplate the stars,
Serenely, unafraid.

The way you take is known,
The burden which you bear.
You do not walk alone,
Earth is not unaware.

Keep freshness in your eyes,
Plant seeds within the sod;
And when the evening dies,
Reach for the hand of God.

Forester Robert B. Parmenter demonstrates how a cruising stick is used to find the diameter of a standing tree. Notice strings from stick nearest his eye to represent line of sight.

Know How to Measure Standing Timber

PLANNING to sell your standing timber this year? If you are, get a cruising and scaling stick and protect yourself against gyp buyers, advises Robert B. Parmenter, Extension Service Forester at the University of Massachusetts.

There's nothing hard or mysterious about estimating the board feet in your standing timber the way he explains it:

1. Hold cruising stick at arm's length against trunk of tree. Using your eye for the focal point of triangle, line up the left end of cruising stick with your eye and left side of tree. Without moving the head, notice where line of sight crosses scale and the right side of tree. Diameter of tree outside bark is read off in inches at this point.

2. Merchantable length is found by standing 59 feet away from tree and

by holding the cruising stick at arm's length with the top edge in line with your eye and top of last log. Notice where line from eye to stump height crosses lower part of stick. Number of 16 foot logs in tree read off at this point.

3. Matching figures received in steps 1 and 2 to table on stick gives number of board feet in tree.

The farmer may also check on buyers by using the International Log Rule. To use this scaling stick a farmer need only know the length of log and measure the diameter inside the bark at small end.

The sticks may be obtained from The Federal Land Bank of Springfield, Massachusetts, at \$1.50 a set.

—Charles L. Stratton.

SLIM and SPUD

The Worm Turns

WISH FOR THE NEW YEAR

By Eleanor Alletta Chaffee

God bless all little ones whose questing feet

Stand on the threshold of another year;
And all who lie awake, hearing the beat
Of Time against a door closed with a tear.
God bless us all in spite of what we left
undone

Lacking the time, the will, and give us
grace

To love a little more, to share the sun
Neighbor with neighbor, for this year's
brief space.

LEFT ON THE ISLE OF SANDS

(Continued from Opposite Page)

low for a little while, as the unspeakable loneliness of their situation dawned upon them.

Rising only a few feet above the level of the ocean, their island could boast not a tree from end to end. Hummocks of sand, piled up here and there by the winds, were all that broke the monotony of the sky-line.

The first night or two, the weather being fine, they took no thought of shelter, and Jules slept, half-rolled in his father's coat, on a soft, sweet-smelling patch of wild peas in a sheltered hollow. Their wakings in the cool, dewy mornings, with the clear blue above them and a light wind waving the grass-tops and wild-rose thickets, seemed to them like passing from one delicious dream into another.

In wandering over the island they found acres upon acres of blueberry shrub in full bloom and thought of the fruit that would soon be ready for their lips. In the inner meadows, and about the shores of the sweet-water lake, they came upon small herds of wild cattle, already established there from vessels wrecked upon the island, and several troops of shaggy ponies; while on the coast they saw wild hogs busy rooting in the sands, fattening on clams and other shell-fish.

With the sight of such abundance before their eyes they forgot to husband the provisions that had been left them by the Viceroy. Christophe Saintine, more prudent by nature than his fellows and made thoughtful by the presence of his boy, strove vainly to check the perpetual waste. He was, with but one rival, the most influential among the convicts; but on the question of economy his voice was little heeded.

It was not long ere cold east winds, and fogs that overhung the island like a pall for days together, drove the convicts to build themselves rude shelters out of some wreckage found along shore. The first gale, a very moderate one, visiting the island when they had been a fortnight upon it, blew down these flimsy shelters, and badly bruised some of the occupants. One man had his neck broken by a heavy timber falling upon it, and they buried him on the sandy shore.

(To be continued)

—A.A.—

WINTER CARE OF GARDENS

PROTECT evergreens with a wind-break or shade to prevent drying by winter wind and sun. It's the drying rather than the cold that causes damage to these trees. After a heavy fall of wet snow, shake small trees and evergreens as a precaution against broken boughs and limbs.

Cover bulbs and perennial roots with a heavy blanket of leaves or other mulch after the ground is frozen. This prevents the alternate freezing and thawing which may heave bulbs and roots out of the ground and leave them exposed to the air. When open weather permits, clean gutters and downspouts so that water will be certain to run off. Constant roof drip can damage or kill plants.

HELP US NAME HIM ...WIN A PRIZE!

A husky new baby has joined the famous Craine Silo family — and we'd like you to help us name him! So, we're offering prizes—big money-saving credits from the established price of any Craine Silo bought in the next two years.

Down Mexico Way

By H. E. BABCOCK

During the spring of 1944 while Mrs. Babcock and I were at South Springs Ranch, the first son of the palomino stallion on the place was born. The colt is pictured at right. The stallion, Muchacho de Oro was four years old at the time, and the colt's mother was a three-year-old seven-eighths thoroughbred sorrel. This colt was raised and in due time sold. Howard and Ann lost track of him, so you can imagine their delight when at the New Mexico State Fair this fall they rediscovered him. He was the lead horse (standing on his hind legs) in the crack drill team pictured below and was identified by the South Springs Ranch brand on his left jaw.

ABOUT the time of the first killing frost each fall, I begin to get letters from readers of this page asking how to find my son's South Springs Ranch in New Mexico. Quite obviously, most of those who write these inquiries are California bound. The best information I can supply is to tell them to drive southwest from Roswell, N. M., on the road which leads to Carlsbad Caverns and when about four miles out of Roswell to begin to look for the sign pictured below. I do not guarantee that it will be adorned by my grandson, as in the picture. He is much too active for me to keep track of him. The rest of the pictures on this page were taken by my son, Howard E. Babcock, Jr., at the New Mexico State Fair at Albuquerque last fall. In order to get some of the shots, he had to be pretty quick on his feet.

How Would You Like To Play This Game ?

➤ New Mexico tag—the bull is "IT."

▼ The fat boy and the fat bull couldn't stick together.

▼ Ten to one the bull misses him; otherwise it would be too bad.

▼ Wonder which one has the hardest head?

AMERICAN AGRICULTURIST
Advertisers

THE B. F. GOODRICH COMPANY, So. Main St., Akron 18, Ohio, has available a silage cap which is a two-piece covering which, after it is put over the silage, is filled with water to pack the silage and prevent entrance of air. This is made of plastic which is resistant to grease, moisture and chemicals.

FOR CALVES: KAF-KIT, a milk replacement for calves recently put on the market by the **WESTERN CONDENSING COMPANY,** Appleton, Wisconsin, is distributed in 42-pound drums. It is not a calf meal replacement; it is a milk replacement with 1 pound being equivalent to 8 pounds of milk.

RESEARCH: For the second year the **RALSTON PURINA COMPANY** of St. Louis, Mo., is offering a number of research fellowship awards. These will be for the 1950-51 school year. Application blanks for the fellowship awards are available by writing the Ralston Purina Research Awards Committee, c/o J. D. Sykes, **RALSTON PURINA COMPANY,** St. Louis 2, Mo.

The seven winners of the 1949-50 fellowships are now enrolled in graduate schools of their selection.

ANNIVERSARY: This past October 14,000 visitors came to Coldwater, Ohio, which has a normal population of 2,500. These visitors came to a week-long celebration of the New Idea Division of the **AVCO MANUFACTURING CORPORATION.** The occasion was the 50th anniversary of New Idea. The principal speakers were M. L. Wilson of the U. S. Department of Agriculture and H. E. Babcock, Director of AVCO and author of *Kernels, Screenings & Chaff.*

MARKSMANSHIP: The **REMINGTON ARMS COMPANY** of Bridgeport, Conn., have two booklets which they will be glad to send you on request. The titles are: "How to be a Crack Shot" and "More Fun with Your '22' Rifle." We would appreciate mention of **AMERICAN AGRICULTURIST** when you write for these booklets.

A new revolutionary vaccinator for poultry called the "Grant Inoculator" is announced by the **R. G. THUESDALE CO.** of Rehoboth, Mass. The patented machine, which is of a syringe type, weighs only about 4 ounces and can be carried around the farm to vaccinate the birds wherever convenient.

Tests have proven the Inoculator does the job easily, effectively, and quickly, and insures correct dosage of vaccine each time. The cylinder will hold more than enough vaccine for 500 doses without reloading. The inoculator is made of aluminum with stainless steel long-lasting needles. The "Grant Inoculator" has an adjustable hand grip that can be adapted to various sized hands and this makes it particularly attractive to women operators who now do so much vaccination work on poultry farms. The company announces the appointment of Durgin and Company, Inc. of Reading, Mass., as their national sales distributors.

Service Bureau

By H. L. COSLINE

CANTON, N. Y., READER GETS REWARD CHECK

ONCE again some cattle thieves fought a losing battle against a tough trio—the police, an *American Agriculturist* subscriber, and a Service Bureau sign. As a result they are now serving a minimum of six months in St. Lawrence County Jail.

Back in June, two men stole an artificially bred calf from the barn of Leon and Hollis Brown of Canton, New York. The Browns discovered the loss when they went to milk, and investigation disclosed tracks leading through heavy grass to the highway. They immediately called the authorities. After a long investigation by the St. Lawrence County sheriff's patrol, Kenneth and Walter Raycraft were apprehended and convicted on a petit larceny charge. Justice Leon G. Crary committed each of them to the county jail for six months.

As a result of their part in bringing these thieves to justice, Leon and Hollis Brown have been sent an *American Agriculturist* reward check in the amount of \$25.

We want to congratulate the police officials and the Browns for the effective manner in which this case was handled. We would suggest that prospective cattle or poultry thieves avoid property posted with a Service Bureau sign.

—A.A.—

CASH CHECKS PROMPTLY

You will remember that I wrote you about a refund that I was unable to get. You secured it for me, but now the check has come back marked "Account Closed." I am hoping you can do something about it.

Of course we will be glad to try, but we would like to point out for the benefit of all of our readers that the check in question was not presented for payment until six weeks after it was issued. Apparently our subscriber carried it around in his pocket for some time; and even then it was not deposited in the bank but was cashed at a place of business, which probably caused further delay.

It is always good business to cash checks promptly.

—A.A.—

PHONY PUZZLES

The use of easy initial puzzles to induce the purchase of goods or the making of donations, followed by virtual "brain-buster" tie-breakers, has been condemned by the National Better Business Bureau as a scheme to deceive and exploit a gullible public. The easy puzzles are merely a lure or "come-on" and it is not until after the contestant makes a donation or buys some goods that he discovers that the pay-off competition requires puzzle solving skill of an exceptional calibre.

The Bureau's criticism is not against the use of tie-breakers which few, if any, contestants can completely solve, or the requirement to make a purchase or donation. It is the fact that the purchase or donation is induced through trickery which takes advantage of the contestant's ignorance of the true nature of the tie-breakers. Business has been urged to cooperate in freeing advertising of such prize contests.

—A.A.—

"Your frank opinion and honesty is greatly appreciated. I am most thankful for your suggestions, and must confess I would not have known where to turn for information had you not so kindly obliged."—Mrs. M. L., New York

Maybe he swerved to miss a deer—his car skidded nearly 400 feet crashing through 4 concrete posts—landing in the field.

The driver, a North American policyholder who had been a rural mail carrier for over 20 years was instantly killed.

\$1000.00 was paid his widow.

Low-Cost "VAC" Case Tractor
with NEW
EAGLE HITCH

1-LATCH ON

Easiest
**3-POINT
HOOK-UP**
You Ever Saw

2-SLIP THE PIN IN

3-AND GO

NEW
**LATCH-ON
IMPLEMENTS**
HOLD THEIR DEPTH

NEW
**HYDRAULIC
CONTROL**

ONE LITTLE LEVER DOES IT ALL

● Moldboard plows in one and two-bottom sizes, two-way moldboard plows, disk plows, disk harrows, disk hillers, listers, field tillers and other tool-bar implements—all are built for "latch-on" hook-up and uniform penetration with the Eagle Hitch.

The new hydraulic control has its pump right on the engine, independent of clutch and gears. It works instantly, moving or standing. Pump is permanently primed, the whole system self-bleeding—no air lock possible. It uses ordinary motor oil. This new control gives high clearance to Eagle Hitch implements, lifts and adjusts cultivators and other front-mounted equipment.

● Now you can hitch and unhitch rear-mounted tractor implements with no tugging or lifting. No need to leave your seat on the tractor.

Now you can have all the convenience of a rear-mounted plow, and yet plow at uniform depth regardless of tough spots and rough ground.

For a new thrill in easy farming, try the Eagle Hitch yourself. Just back the "VAC" tractor in position ahead of the implement and open the latches with the convenient cord. Touch the hydraulic control and see the open throats of the hitch take hold of the implement like an eagle grabbing a rabbit. Let go the cord, slip in the single pin at the top, and GO.

Follow the plow along the furrow. See how well it holds its depth when it hits the tough spots. See how steady it runs, even when tractor wheels go over humps and hollows. That's because the Eagle Hitch leaves the plow free to hold its depth, without help from hydraulic lift or gauge wheel.

Eagle Hitch, Latch-On implements, new sealed-unit hydraulic control—you get all three with the low-cost all-purpose "VAC," or the new high-clearance "VAH" tractor. See your Case dealer about a demonstration now. Send for latest catalog on the 2-plow "VA" Series, larger 2-plow "S" Series, 3-plow "D" Series or the mighty 4-5 plow "LA." J. I. Case Co., Dept. A-11, Racine, Wis.

THE FARM PAPER OF THE NORTHEAST

Growing Good Fruit IN 1950

By Dan Dalrymple

Secretary, New York State Horticultural Society

SOME GROWERS may wonder what's the use of thinking about the 1950 apple crop, with several million bushels of the 1949 crop unconsumed; but in my brief experience as a grower, I have observed that the time to have fruit is the time when the other fellow doesn't. Often big crop years like 1949 are followed by shorter crop years. Ordinarily we would expect that 1950 would be a better year for our apple growers and just as satisfactory for other fruits as 1949, price-wise.

The 1949 crop set a high standard of quality, color, freedom from disease and insect injury. Competition from other areas and other fruits makes production of high quality apples at low cost a must. Marketing, after this first step of good production, is a topic by itself.

I have come to regard pruning as the most important single job on a fruit farm. Good pruning saves time, materials, and gives you better

color and size. Some trees should be pruned very close to the ground, especially this year. The removal of low quality varieties of old trees that only bear apples every other year when every orchard does is essential, as well as unknown types that have gone out years ago, wild trees in the hedge row, and choke-cherries which harbor pests and diseases. Big bulldozers are doing a wonderful job on big trees in western New York this year, pushing roots, stumps, tops and all up in piles where they can gradually be burned. The new chain saws are doing a fine job in cutting these non-profitable trees off and up into manageable sizes.

After this first job of getting the inefficient producers out of the way, comes the perennial problem of deciding which limbs to cut off. One grower I know is now engaged in slaughtering his beautiful young productive orchard on good land, apparently too much intrigued by the idea of improving quality and size. This grower feels that if a little pruning is good, much more is better.

Too much pruning will reduce yields and give such succulent growth of suckers and leaves that the fruit will not be well-colored, but will give the blown-up, puffy apples that no one wants any more. If we happen to have a severe cold spell, these heavily pruned trees may canker from sun-scald on the exposed, heavily-cut surfaces.

More growers are doing little or no pruning, pointing out that the price of apples—even good apples—will not justify the expense. Trees in many of these orchards are old and thick, and it is almost impossible to get spray material through them when the leaves are on the trees. They must be fertilized heavily to get even a reasonable set, and in this case will have small

Before top quality fruit can be harvested next fall, a vast amount of work and cash must be expended. In addition to pruning, which Dan Dalrymple discusses here, there will be plenty of tasks such as spraying, trimming and harvesting.

As Dan points out, there is only one way to trim this kind of a tree, and that's close to the ground.

green apples which nobody wants except the English, and they will not take many. Most growers try a reasonable compromise between these extremes, based on experience and soil.

Owners of a good many orchards in New York State, especially those planted thirty years ago, are finding their trees are getting big and close together. We are beginning to find that these older trees, thirty years or older, will stand a considerable amount of heading back, both on the top and on the sides. If this heading back is all done in one year, or if it is accompanied by too much nitrate, there will be too heavy a growth of suckers. So take it easy.

Several growers are now cutting openings into four corners of the trees to let in sunlight and promote more bearing surface near the trunk. Here again, if this is all done at once, we may get severe scalding, especially on the heavier soils. Severe weather or marginal soils create several problems for the pruner.

Some varieties suffer more than others from severe pruning. Baldwins, for instance, cannot take too much topping, although near Lake Ontario some of us have done pretty severe cutting without too bad results, if a few suckers are left for shade. Almost anything can be done to an apple tree where you have 15 to 20 feet of good ground underneath it and where temperatures do not get too low.

Cutting openings into the tree, or all

(Continued on Page 12)

Feed Costs Can be Cut

A Timely Message to Poultrymen

POULTRYMEN, squeezed between low market prices for their eggs and high production costs, are looking to their cooperative for action. Here is what is being done

New Mash Saves \$5.00 Per Ton

A new laying mash called "G.L.F. Egg Maker" has been formulated and is now available through G.L.F. Service Agencies. This mash takes advantage of a number of good ingredient buys. Nutritionally, it is complete and has margins for safety on all the important vitamins and minerals needed for high egg production and hen health. (In some areas freight differentials make it possible to save more than \$5.00 per ton.)

"G.L.F. Egg Maker" will continue to be in the G.L.F. poultry feed line-up and the formula will remain constant except where new developments or great savings can be made. Any formula changes will be announced through Service Agencies in the usual manner

"G.L.F. Egg Maker" is priced at \$5.00 per ton under the regular G.L.F. Laying Mash. With average production on today's market this \$5.00 per ton saving actually increases the spread between the cost of producing eggs and egg receipts by 1c on every dozen.

Further Savings on Grain

Careful selection among the grains and

scratch mixtures available through G.L.F. can save from \$5.00 a ton on scratch feed.

A ready-mixed 50-50 corn and wheat scratch is the most expensive grain to feed. Whole or cracked corn is the cheapest. Straight corn will save around \$10.00 a ton, and during cold weather is just as good as a mixed scratch. Of the mixed scratch feeds, Super Coarse or Coarse Scratch with Oats are the best buys.

Selling Eggs

The only way to dispose of a surplus is to eat it. G.L.F., along with other poultry groups, is actively working with the grocery trade, the press, and the public to increase consumption of eggs. Most of this work is being done through the Poultry and Egg

National Board, of which G.L.F. is a member. PENB has developed a flow of information to consumers designed to increase the consumption of eggs and poultry by the general public. Through efforts of PENB, egg consumption is high and on the increase.

G.L.F. marketing personnel is also on the hunt for more markets for Nearby eggs. In addition to metropolitan New York, the G.L.F. Marketing Division is shipping eggs to markets in Boston, Pennsylvania, West Virginia and is now developing markets as far south as Georgia. A competent and aggressive sales policy such as this on Nearby eggs is beneficial to every egg producer in G.L.F. territory.

* * *

Today's egg surplus is partly seasonal, but the price is lower and the surplus will last longer because government policies have for several years encouraged expansion. Feed prices cannot decline as easily as they should because price supports make them sticky and slower in movement.

There is no quick and easy way out of a position like this. It has been a long time building up and will take time to work out.

As other opportunities appear where G.L.F. can make savings for poultrymen, they will be adopted and poultrymen notified so they may have the opportunity to use them if they wish.

COOPERATIVE G.L.F. EXCHANGE, INC.
ITHACA, NEW YORK

Feeding G.L.F. Egg Maker

A gradual change in each laying house is recommended when changing to a new mash. A good practice is to put the new mash in only one hopper and move on to other hoppers as the birds consume new feed. Another method is a gradual mixing of the new and old mashes in the hoppers, stepping up the amount of new mash in the mixture each day.

New York 4-H Livestock Champions for 1949

By H. A. WILLMAN

Four-H Club Livestock Specialist

EIGHT outstanding 4-H'ers were recently selected as the 1949 New York State 4-H Dairy and Livestock project champions. To be named as the State Champion 4-H Holstein Club boy or girl or the winner among the other dairy breed and among 4-H sheep, swine or beef cattle workers is one of the finest honors that may come to a club member. So say several former State 4-H champions.

Many qualities are considered in the final selection of these winners each year. These considerations include years in club work, completeness and accuracy of project records, leadership work, and the development of flocks and herds. Much emphasis is also placed on the use of improved practices, participation in livestock activities, and on the number of animals that are bred by the members.

The Winners

Among the dairy champions were David Orton, Sidney, Delaware County, representing the Holstein breed; Herbert Staring, Lowville, Lewis County, for Jerseys; Margaret Lane, Ballston Spa, Saratoga County, for Guernseys; Leon Pritchard, Canandaigua, Ontario County, for Brown Swiss; and Beryl Walseman of Carthage, Lewis County, for the Ayrshire breed.

The meat animal champions were Ralph Blik, Williamson, Wayne County, who represented the best among the swine members. On sheep, Betsey McVey of Black Creek, Allegany County, won first, while Phillip Taylor from Lawtons, Erie County, was named champion among the 4-H Beef feeders and breeders.

A Good Start

These champions, except for one member, range from 19 to 21 years of age. They all started their work in much the same way and their progress has been very similar. From their original start either with a calf, sow or ewe, this group now owns 157 head of livestock, more than 30% of which trace either to their first or second project females. As a result of the growth of their 4-H enterprises and the interest that they have shown in owning better livestock, many new practices have been adopted on their home

farms. With the State champions, some of these practices and services include the keeping of purebreds, the use of selected bulls, artificial breeding, calf-hood vaccinating, official classifying, and Dairy Herd Improvement testing.

Herbert Staring, the State Jersey champion, says that he "has just applied for a life membership in the American Jersey Cattle Club." Beryl Walseman and David Orton also report that their older cows have been officially classified under their National Breed Association program. Thirty-two of their 81 head of cattle trace to either their first or second project calves. Many other examples might be given to show the influence of a 4-H project beginning. For instance, Betsey McVey now has 23 head of sheep, and they all trace to her first two project ewes.

Many Nominated

The State champions had plenty of competition because forty-nine counties nominated 295 of their most outstanding dairy and livestock club members for the various State project championships. These county winners, who now own over 2,000 head of livestock, represent nearly 10,000 New York dairy and livestock members. Furthermore, they average 16 years of age and have stayed in club work for an average period of 5.3 years.

The closest contenders for the 1949 State Holstein championship award were Edwin Coleman, Wyoming County; Charles Johnson Jr., Orange; Harold Grover, Chenango; Franklin Pells, Columbia; Robert Peterson, Lewis; Arlton Lamont, Schoharie; Leon Timmerman, Jefferson; Kenneth Roberts, Oneida; Kenneth Stewart, Sullivan; Alvin Wayand, Yates; Richard Brooks, Cortland; Roger Hoornbeck, Ulster; Arnold Cope, Otsego; Donald House, Livingston; Paul Hudson, Onondaga; Oscar King, Franklin; Joseph Fisher, Madison; William Behling, Cayuga; Ruth Schneider, Lewis; Jeanne Pendergast, Onondaga; Helen Story, Washington; Sylvia Brach, Orange; Shirley Rohring, Niagara; Margaret Ross, Erie; Barbara Hahn, Dutchess, and Barbara Tucker, Ulster.

For the Guernsey breed award, Robert Carey of Cayuga County and John Jack of Delaware received an honor-

GET GREATER COVERAGE

at LOWER COST with FARQUHAR IRON AGE

ALL NEW..

LIGHTER DRAFT ORCHARD MIST SPRAYER ASSURES COMPLETE COVERAGE WITH CONCENTRATE SPRAYING!

Now Farquhar gives you more orchard and grove spraying efficiency than you've ever had before! Double axial blowers allow spraying from either or both sides of machine. Special discharge orifices make more efficient use of high speed air blast. Reversing controls automatically cleans nozzles. High pressure break-up assures right droplet sizes for any type of spraying. Operated by one man from tractor seat.

New Double Spray Head Covers 2

Rows at Once... Farquhar's amazing new double spray head attachment covers both sides of row at same time... does twice the work on one high-speed drive-through, with tremendous foliage agitation for complete penetration. Controlled application guarantees thorough coverage. Easily converted to single spray head or conventional Iron Age machine.

Iron Age High Pressure Orchard Sprayers Meet Every Grower's Need...

Complete range of sizes and capacities, available with double spray heads, booms and guns—power take-off or engine drive, for orchard, grove and vineyard operators. Rugged construction assures long life, minimum upkeep. Streamlined design permits easy passage between rows.

Complete Line of Iron Age Orchard Dusters... Iron Age High Velocity Dusters are built in all capacities and sizes to provide quick, low-cost crop protection, no matter what the acreage. Precision-built blower runs smoothly and easily, delivers strong, accurate dust blast. Power take-off and engine-driven models.

No matter what your spraying requirements, Farquhar Iron Age offers you the right orchard or grove model to give you more coverage at lower cost. See your nearest Farquhar Iron Age dealer for complete information.

PLANT AND SPRAY THE IRON AGE WAY

THE EDITORIAL PAGE

LET THEM TRY IT!

ACCORDING to a statement from the Bureau of Labor Statistics of the U. S. Department of Labor, the average American working man can buy more food for an hour's labor than the average working man of any other nation except Australia. Russia, as you might expect, is at the bottom. Based on an index of 100 for the United States, some of the other 18 countries in the study rate as follows in food-producing power of real earnings:

Australia	109
United States	100
Norway	88
Great Britain	71
Ireland	45
France	35
Austria	23
Russia	18

Here are some examples of the number of minutes of working time required to buy food in different countries covered by the survey:

	1 doz. Eggs	1 lb. Wheat Flour	1 lb. Pork Chops	1 lb. Sugar
United States	27	4	32	4
Britain	57	5	29	10
Ireland	170	7	...	11
Italy	112	22	133	46
Russia	158	52	407	141

I sometimes wish that those who want to trade off our liberties for the social and economic systems of other countries could have a one-way ticket to those countries that they admire so much. How long do you think it would be before they would be yelling to come back?

A JOB FOR EVENING AND WINTER DAYS

IN RECENT YEARS so much has been said about planning, and so many attempts made by government to plan our lives and business for us, that the word "planning" has come to have a bad taste in our mouths. However, nothing much was ever really accomplished without a good plan, a plan made by ourselves and with our families and partners, not by some outsider.

This is the time, therefore, to make careful plans for your big farm campaign for 1950. These long winter evenings are the time to sit down with the family, look at the map of your farm, decide which fields should be plowed, consider the crops and the rotations, determine what you are going to do, and then make a list of seeds, lime and fertilizer with which to implement your plan.

The next step is to order your supplies and get them on hand. The first ones in the markets are first served. If there are shortages later, what a satisfaction it is to you to know that you are all set.

Another job is to list your farm equipment, then look it over and set down what new machines you must buy, what repairs must be made.

This kind of planning and preparedness not only will save you dollars but it will save you from worry and irritations when your field operations start to roll.

MILK CURED HIM

SOME TIME AGO I wrote a piece here reporting that the scientists and nutritionists now think that every person should drink a quart of milk a day, and that nothing else we eat would do more to keep our bones—and therefore all the rest of us—young.

Among the letters received as the result of the editorial was one from a reader which states that for many years he had leg cramps at night resulting in lack of sleep and much suffering. His doctor said that the trouble might be due to lack of calcium and vitamin D.

"So I resorted to a much greater use of milk, increasing my consumption till I got it up to two quarts a day. That means with me about three glasses of milk per meal at noon and night, with a glass or two in between. I have followed this practice now for several months and I have learned to like it. Cramps are a thing of the past and they don't bother me now in the least.

"I am convinced that where an elderly man uses butter and at least a pound of cheese per month, with only one quart of milk a day, he is not getting

By E. R. Eastman

the amount of milk that his system requires in order to maintain the calcium in his bones. In my case it takes two quarts per day, with butter, and at least a pound of cheese a month."

I have often wondered why so many dairymen themselves use such small quantities of milk. We all know now that it is the cheapest food at almost any price that there is. Dairymen get this food at the wholesale price.

We now know also, and there is more and more evidence to prove it, that milk and other dairy products are absolutely essential to grow strong bones and to maintain them without deterioration to a ripe old age. We know that milk has many other health-giving properties, to say nothing from the farmer's standpoint of the need of cutting down the milk surplus. If every farm family would use the milk, butter, and cheese needed to maintain good health, it would go a long, long way toward solving the market surplus problem.

CAN WE GROW CORN FOR GRAIN IN THE NORTHEAST?

TIME WAS when the Northeast was a great corn-for-grain growing section. With what pride our grandfathers bragged about their yields and selected the best ears and tied or braided the husks together to save for seed! How they argued about the best varieties! By the way, what did they call those strings of ears? If I ever knew, I have forgotten.

Then the great West opened up and the grain corn business traveled west. Now there are some indications that it is coming back. The development of early maturing hybrid varieties makes it possible to get good yields of ear corn on eastern farms where it couldn't be grown before. Also, we know a lot more about growing corn, but many farmers question whether growing corn for grain in the East is here to stay and to increase. What do you think? Let's have some short letters from good farmers based on practical experience.

NORTHEAST FARMING ON A SOUND BASIS

THE PENNSYLVANIA State College of Agriculture in 1947 made a cross section study of the credit needs of a large number of Pennsylvania farmers in many different counties. At that time about half of the farmers had no debt, about one-fourth owed less than 9 cents per dollar owned, only about one farmer in four had real estate debt, and about half had some kind of a short-term debt.

Without doubt an accurate survey taken anywhere in the Northeast would show a similar excellent farm credit situation. There have been few times in the history of northeastern agriculture when the average farmer was in sounder financial standing than he is now. Let's hope and pray that he can stay that way.

A GREAT TEAM

THE RIGHT KIND of a father-and-son partnership on the farm can make a great team. It is an excellent way for a young man to get started in farming, and it offers an opportunity for the older man to let up a little in his work and responsibility. But like all worthwhile things, if poorly planned and managed, a father-and-son partnership can be a dismal and disheartening failure. This is the time of year when such partnerships are often started, so it is a good time for you to keep certain principles in mind:

1. The father should get the idea out of his head that his son is still a boy. It is a fault with many parents to think that their children never grow up and therefore need constant bossing.

2. A farm partnership between father and son or a younger and older man is a business relationship,

and should be kept on a business basis. Therefore, there should be a written agreement.

3. If the son is married, don't try to put both families in the same house unless no other arrangement is possible.

4. It should be agreed what each party to the contract will contribute. The main jobs which each shall do should be set down, and agreement should be reached on what share of the net income each shall have.

5. Simple accounts are an absolute necessity. If you haven't already done so, take an inventory right now or at the beginning of the partnership, and then keep a simple cash record.

ACRES OF DIAMONDS

THERE IS a true story of a pioneer farmer in California by the name of Sutter who, in the late 1840's, became discouraged with farming, sold his farm for a song, and wandered away to prospect for gold. He never found it, but shortly after he left on his search, gold was discovered on the Sutter farm and there followed the Gold Rush of '49, the greatest in all history.

There is another story about a ship way out in the ocean off the mouth of the Amazon River. The crew was out of water and on the verge of perishing from thirst. Suddenly a sail was sighted coming up over the horizon and, grabbing his megaphone, the captain shouted:

"Water! Water! else we die!"

The captain of the other ship answered:

"Drop your bucket where you are. You're in fresh water from the Amazon even though you are fifty miles from the coast!"

When I was a boy I heard Russell Conwell, noted lecturer, give his famous talk "Acres of Diamonds," the theme of which was that most of us are continually seeking the gold at the end of the rainbow in some far-off place, or trying to break down the fence to get into the other fellow's pasture because we think it is greener and better than our own, when more often than not there are acres of diamonds of happiness right in our own backyard.

It seems to me that just about the greatest art in the world is the art of appreciation, the ability to stop frequently and count our blessings instead of complaining about all the things we don't have. We need the ability "to drop the bucket where we are" and to appreciate better the diamonds, material and spiritual, with which God has blessed us.

NOT TOO MUCH TIME LEFT

THE CONSTANTLY increasing amount of equipment on farms makes more necessary than ever the need of getting the overhaul and repair job done early. There are now only about 70 to 80 days before you will be right in there up to your neck with your tractors and other equipment in the spring campaign.

There are plenty of dealers and plenty of trained service men to do your repairing and overhauling jobs now, but twice the number of mechanics will not be enough to get your equipment ready on time if you leave it until two weeks before you need it. Give the dealer or repair man and, last but not least, yourself, a break!

EASTMAN'S CHESTNUT

MY FRIEND, Rev. Walter Dodds, Pastor of the First Presbyterian Church of Ithaca, got a big laugh at Rotary the other day when he told this story:

A man and his wife had just returned from a party where the woman, according to the husband's viewpoint, had spoken out of turn and had been talking too much, so he said to her:

"Jenny, why the dickens can't you ever stop to think before you say something that you shouldn't?"

To which Jenny replied:

"How in the world do I know what I think until I hear what I have to say?"

AA's Farmers' Dollar Guide

WASHINGTON: President's message to Congress indicates continued belief in "Fair Deal" including such things as socialized medicine and the Brannan Plan, and shows no inclination toward overall tax reduction. National Association of Manufacturers has proposed a budget about \$10,000,000,000 below the figure the President proposed. Reports indicate that congressmen are more economy minded. Result of clash of ideas will bear watching. The A. A. staff is "rooting" for more economy and less socialism.

OLEO: By time you read this, Federal tax on colored oleo may be repealed. Dairy interests are concentrating on prevention of misrepresentation, and prohibition of interstate shipment of colored oleo. Many farm organizations in past have favored dropping the tax "providing adequate safeguards are set up to prevent sale of oleo as butter."

C. C. C. Bill has been introduced to increase borrowing authority of Commodity Credit Corporation from \$4,750,000,000 to \$6,750,000,000. Increase of 2 billion is characterized as expected cost of price supports of farm products in 1950. Debate on measure is expected to bring strong criticism of support costs but increase will probably be authorized.

At present, C.C.C. has about 2 billion tied up in inventories of farm products bought in 1948. Another billion is tied up in 1949 crops and another billion will be needed to complete the 1949 job.

Products owned by government will be disposed of by (1) exporting at a loss (2) selling on domestic market (3) school lunches or other gifts (4) spoilage or deterioration.

FARM SUPPLIES: It is time to figure on farm supplies for the coming year. We have already reported expected shortages of some grass and clover seeds. To add to trouble, export controls have been discontinued on a long list of grass seeds. Buy early.

Strikes in the Southwest have cut production of potash for fertilizers. Demand is likely to outrun supply. Order early.

Prices of wire, galvanized roofing and other requirements that use steel are likely to be higher.

FARM LAND PRICES: Compared to a year ago, land prices, country-wide, are off 6%. Western states have had biggest drop. New Jersey is one state where no drop is reported. Continued downward trend expected but not a bust.

EGGS: Immediate outlook for poultrymen is not rosy. In spite of requests of poultry organizations, egg price supports were kept at a level that encouraged production above demand. Government bought eggs, mostly in mid-west, but purchases affected Northeast price indirectly.

Now, price supports have been lowered. For that and other reasons, egg prices have dropped drastically. It would have been far better to take the cut earlier and more gradually.

In the meantime, don't sell the hen short. Poultry will continue to be an important Northeastern farm enterprise.

LIBERTY: Many comments, mostly favorable, came as a result of our December 3 "Forum Issue." Some readers said "we agree with what was said but you give no solution to the problem." There is no "cure-all" but here are some things you can do as individuals.

1. Vote at every election, school, town, state and national.
2. Study the issues. Make your decision on the basis of the long-time benefits to the country rather than on the short-time benefits to yourself.
3. Insist that candidates face issues frankly and openly.
4. Discuss such subjects as socialized medicine, The Brannan Plan, deficit federal financing, the need for lower taxes, etc. with your friends, both individually and in groups.

The present trend toward "statism" and loss of liberty will not be reversed until a majority of our citizens want it reversed and are willing to fight for it!

The Song of the Lazy Farmer

A NEW decade's ahead of us; in spite of all the foolish fuss 'bout whether it's the end of one or a brand new one has begun, there still are ten more years to come and you can bet there will be some astounding changes taking place affecting all the human race. And, looking backward, I will bet that farmers are dead sure to get their share of new machines and ways to ease their work and shorten days. Just look back at the last few years and start forgetting all your fears that we have gone as far's we can, then look ahead and start to plan.

Already I am practicing for that time when 'most everything will get done up the easy way, in just a couple hours a day. I'll do my farming with my head, from where I lie here in my bed I'll push a button, throw a switch, and then without a single hitch the cows and hogs will get their feed, the hens will have the things they need. With plant food, new crops and machines, our stuff will grow just like Jack's beans; we'll whip the pants off ev'ry pest and make the weather that works best. Mirandy won't have much to do, she'll probably get lazy too.

 4. An Easy Way To Get Yourself Some 5-gallon Cans.

1. About Overhauling Farm Machinery.

There's generally a quiet spell this time of year, when you get time to work around the shop, greasing and overhauling.

You can make the job a lot simpler by using Gulf's new All-Purpose Farm Grease. It does nearly everything, from greasing tractor distributor shafts to preventing rust on mower blades. And you only need to store one can of grease.

This All-Purpose Farm Grease took us four years to develop. Passed every test, including wheel-bearing tests and water-leaching tests. Ask your Gulf dealer about Gulf All-Purpose Farm Grease.

Reminder: If barn flies make your cows switch and fuss just when you're trying to milk, Gulf Livestock Spray will get rid of those annoying insects in a few seconds. It's economical, too. Usual price only \$1.49 a gallon.

2. Useful Tip for Tractor Owners.

You can save neck cramps by mounting a fair-size rear view mirror on your tractor lever handle, or some other likely spot. It's most helpful when you must watch your driving and the operation of

the binder, plow or other implement at the same time.

3. Avoiding Electric Motor Repair Bills.

According to electrical men, electric motors are often ruined by over-oiling. Too much oil causes a churning action in the bearing, driving the hot oil along the shaft and spraying it into the motor.

Eventually, oil rots motor insulation. It also gathers carbon dust from the brushes in commutator-type machines, causing grounds and short-circuiting the segments.

Small amounts of Gulf Electric Motor Oil, used regularly, will help you avoid costly repair bills. Made by Gulf's own Alcholor Process, it's three times as viscous as ordinary "household oils." Comes in handy can with spout. 23¢ for 4-oz. size, 35¢ for 8-oz. size, at your Gulf dealer's.

4. An Easy Way To Get Yourself Some 5-gallon Cans

 Gulfube is a Multi-Sol processed oil, refined from the finest paraffin crudes. It's a mighty good oil to use in your car, tractor or stationary engine.

Next time you need motor oil try buying Gulfube in the new 5-gallon size. That way, you get a handy 5-gallon can that you can keep. A strong one that you can bang around plenty, too. Has tilted pouring spout, screw-on caps and wooden bail handle.

Next time you're in town, get this handy can at your Gulf dealer's.

See Zeke: "When buying plant food, I'm sure to raise Cain 'Til I get what I ask for . . . Swift's BLENN for my grain!"

New Process
Blenn
Swift's
Specialized Crop Maker

Be like Zeke! He insists on the best in plant food. You, too, will find that New Process BLENN, Swift's specialized crop maker, is your best buy for bigger yields, better all-round results. Yes, New Process BLENN is a really profitable investment. It actually lowers the cost of production per bushel. It helps to grow more from each acre you plant and to earn more money from the grain you grow.

What New Process means . . .
You've known BLENN as Swift's quality crop-making plant food. Now, through research, Swift has developed a new manufacturing process that makes BLENN even better—complete mechanical mixing, followed by complete chemical processing.

What New Process does . . .
It makes BLENN, like all Swift's Plant Foods, more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform freedom from caking, lumping, bridging; 3) uniform distribution through your machines; 4) uniform feeding of your crop throughout the entire season. Users of New Process BLENN report yields way above average for their area. And higher grades that bring top prices. There's no wiser way to "spend money to make money" than to buy BLENN.

BLENN, Swift's specialized crop-maker, is greatly in demand. Order your supply early. Then you'll have it on hand when you need it. See your Authorized Swift Agent today.

Buy at the sign of the RED STEER

A Good Steer

A farmer said to me a few days ago, "You know, soon as I started using plant food on my hay and pasture land, I noticed the cows ate the hay and pasture a lot better—even the grass hay. I believe a cow knows what she needs, maybe better than most humans know what they need. So, from now on I'm using plant food for my hay and pastures. I get a better stand and a bigger yield."

* * *

Why not give BLENN a try on your grain? It'll add the right proportions of the right growth-making elements.

Leon Hill found out . . .

"In 15 years of farming I have used many plant foods. Last year I found the answer to my plant food 'wants' . . . Swift's BLENN increased my yields by 10% per acre. Such an increase is high, as I have always followed good cultural practices. It's proof to me that BLENN is a superior plant food for grain."

Leon Hill, Sandy Lake, Pa.

FREE! Here's a wonderful opportunity to cash in on the experience others have had with New Process BLENN. We will be glad to send you a 16-page booklet that gives the facts about this specialized crop-maker. Simply write to Plant Food Division, Swift & Co., Chicago 9, Ill., and ask for it.

Why the Apple Institute Was Organized

By L. W. Marvin

THE NEW YORK and New England Apple Institute was organized in 1935 to promote the varieties grown in this area and to provide an industry approach to the many problems involved in marketing the crop. Since that time, fifteen other similar organizations have been organized and now comprise what is known as the National Apple Institute with offices in Washington, D. C. Two of these regional groups, Washington State and Michigan, now operate under state advertising assessment laws. Two other states, Virginia and Maryland, have state advertising laws. The rest of the groups, including this one, are on a voluntary contribution basis.

In our case, we ask growers to contribute one cent per box of commercial apples they sell to finance the Institute's work. For the last several years, contributions have been received on only about 25% of the commercial crop grown in our seven states. Heroic efforts have been made to get a much larger percentage of the crop participating in the Institute and from time to time there has been talk of state tax laws, many growers taking the position that they will not support a promotional program unless every grower does. However, constitutional limitations in several states appear to preclude any possibility of a state tax that would answer this demand.

Budget Is Small

In the meantime, the Institute has attempted to carry on a promotion and industry betterment program in keeping with the needs. By and large, those growers who have familiarized themselves with our activities feel that a good job has been done despite so small a budget for so large an industry.

We cannot, of course, engage in any paid advertising campaigns similar to those conducted by Washington State, Michigan, Florida citrus, Sunkist and the like because of lack of funds. But we feel we are compensated for this to some extent by the great amount of newspaper and radio publicity we have been able to obtain for apples by the simple service of providing food editors with news about the crop and its uses. For example, during this season's harvest period, newspaper and radio personnel in many of our markets were taken on orchard tours to give them a first-hand look at our fine quality, our many good varieties and

our packing and storage methods. Many fine articles resulted, some of them full page features.

The biggest job facing the Institute in the way of promotion is to encourage better packing, transportation and handling methods so as to be able to present our apples at the point of sale as close to orchard perfection as possible. As a result of very successful experimental operations along this line last season, the Institute will concentrate on this type of effort from now on. By working closely with retailers and the growers supplying them, we are able to bring about a degree of understanding on both sides that is resulting in better fruit at the point of sale. Unbruised, un-stem-punctured apples sell lots faster than "beat-up" ones, and from our observations in hundreds of stores we have concluded that the greatest boost we can give growers is to get our apples through to the store bins in attractive, appetite-stimulating condition. Where this has been done, we have noticed sales increases as high as 300 to 400%.

This job has a good many angles, starting with handling in the orchard and packing house, types of containers and packs, transportation hazards, handling at wholesale and retail levels and proper display and merchandising practices.

Better Support Needed

Through its affiliation with National Apple Institute, this Institute participates in various industry-wide activities such as government purchase programs, reestablishment of export markets, nation-wide sales drives. For the first time in the industry's history, a research program on the nutritive values of apples has been inaugurated on a national scale.

The Institute's outlook over the next few years should be a very good one because the outlook for the apple industry is good. Of all the tree crops, apples would seem to be in a relatively good position, but if the Institute is to broaden the scope of its activities to the degree that it can adequately serve this multi-million dollar industry in the seven northeastern states, it needs the unselfish support of every commercial apple grower. Every grower has since 1935 benefited in many ways by its work. These benefits can be increased when more universal support is forthcoming.

SOMETHING NEW IN BARNS

I am sending you a picture of the new type laminated high Gothic barn that was put up on my farm this last summer. The barn is 72' by 36' with a 9' basement which is used to house 100 head of registered Hampshire sheep.

The small building attached is 24 x 26 and made mostly of lumber from the old barn that I tore down. It has two 10-foot doors to hold my truck and two tractors, and the upper part holds 200 chickens. It is the first barn of this type in my territory and is being looked at by many men.—John Shakeshaft, Churchville, N. Y.

Fertilizing Canning Peas

By George Serviss

DURING the war years, Dr. Charles Sayre of the New York Agricultural Experiment Station at Geneva established the fact that more liberal fertilization with nitrogen would not only increase the yield of canning peas in New York, but would improve the quality and would permit another day or two to harvest peas without sacrifice of quality. These are all-important considerations in determining the analysis and amount of fertilizer to be applied for canning peas. Peas are paid for on a quality as well as a yield basis. Yield increases rapidly near harvest time and an extra day or two often means a substantial increase in yield. This is desirable if it can be obtained without sacrificing quality. To get these benefits usually means that 50 pounds of nitrogen per acre must be applied in the fertilizer. New York recommendations this year specify 500-600 pounds of 10-10-10 per acre on sandy soils and 850 pounds of 6-12-6 per acre for loam soils, the fertilizer, of course, to be drilled separately from the seed.

Fertilizing Old Timothy Fields

Field reports indicate last summer's drought resulted in far more seeding failures than normal. This will mean that many timothy fields that would ordinarily be plowed will be hayed for another year. Corn and oats (seeded) will probably go back on the same fields they were on this year in most cases where seeding failures occurred. To get yields from a timothy field that has been harvested three or four years, calls for liberal nitrogen fertilization. The same is true where corn is grown two consecutive years on the same ground. Manure, of course, is a good source of nitrogen, but on most of these farms there is not likely to be enough to supply these extra nitrogen needs.

To supply the extra nitrogen needed to maintain yields, the farmer has a choice of a high nitrogen mixed fertilizer like 10-10-10 or straight nitrogen materials such as ammonium nitrate, nitrate of soda, cyanamid or A.N.L. For corn, I would suggest an extra 100 pounds of 10-10-10 for each two tons of manure a farmer lacks to cover his land at the normal rate. For instance, if he normally manures for corn at a rate of 12 tons to the acre and he only has 8 tons to apply this year, in-

crease his fertilizer application to the extent of 200 pounds of 10-10-10.

If timothy fields are only to be held over for one additional year, straight nitrogen is the most economical deal. In this case, 100 to 200 pounds to the acre of ammonium nitrate, or double that quantity of the other nitrogen materials listed, will greatly increase the yield and do so economically. In many cases, the yield will actually be doubled. The increased hay from nitrogen fertilization will be cheaper than hay from an emergency crop such as sudan grass or soybeans.

— A.A. —

TOPDRESSING FOR PASTURES

Pastures and meadowland topdressed in early spring will be ready ten days earlier and a better crop of hay or grass will result, advises L. H. Smith, Vermont Extension Agronomist. He recommends the following grades and amounts of fertilizers: "On sods which are over 50% legumes, apply 900 lbs. of 0-14-14 or 600 lbs. of 0-20-20 per acre. When 25 to 50% are legumes, apply 400 lbs. of 8-16-16 or 600 lbs. of 5-10-10 per acre. If the sod is practically all grass, 400 lbs. of 10-10-10 or 600 lbs. of 7-7-7 complete fertilizer should be applied."

— A.A. —

RECORD CORN YIELDS

"Good cultural methods, more than any other factor, produced the top yields in the 1948 Five-acre corn contests sponsored by the Pennsylvania Crop Improvement Association," writes Professor J. B. R. Dickey of Pennsylvania State College. "The biggest crop—174.5 bushels of dry shelled corn grown in lower Chester county—was produced on old alfalfa sod top-dressed nearly every winter with manure and reinforced with 500 lbs. of superphosphate. In addition, the farmer plowed down 800 lbs. of 0-12-12 fertilizer and put on 8 loads of reinforced manure per acre for the corn."

"The corn was dropped 10 inches apart in 36-inch rows, and the total stand of corn per acre was 13,900 stalks, with ears averaging .85 lb." Professor Dickey says, "Theoretically, the stand was not thick enough for the fertility level of the field and abundant moisture of the 1948 season, since the ½-lb. ears which are the desired goal for maximum production were exceeded by nearly ⅓ lb."

— A.A. —

FERTILIZING THE HOME GARDEN

THE Home Vegetable Garden" is the title of New Hampshire Extension Circular 273. In discussing fertilization of the vegetable garden Professor Heppler makes this statement:

"The most easily obtainable fertilizer on the average farm is barnyard manure, which is fairly high in nitrogen and potash but low in phosphorus. An application of 15 to 20 loads plus 1,000 lbs. of superphosphate per acre is recommended for the vegetable garden. The manure may be broadcast and plowed under, or, if well rotted, may be spread on the plowed land and harrowed into the soil. If manure is scarce, it may be used every other year or in half the quantities recommended, but it should then be supplemented by 1,000 lbs. of a 4-12-4 or 5-10-5 fertilizer. Where no manure is available, use 1,500 lbs. of a 5-8-7 fertilizer."

— A.A. —

One bushel of fresh spinach or other greens can be made into about 15 pints of canned or frozen spinach.

A SIGN OF SPRING

THE new seed catalogues are the first sign of spring. Besides giving you a hopeful feeling that winter cannot last forever, the modern catalogue contains a wealth of useful information on new varieties, planting dates and cultural directions.

Nurserymen and seed growers who are advertising in current issues of *American Agriculturist* will be glad to send you catalogues on request.

If you haven't looked into FUNK G HYBRIDS recently you've got a big surprise coming. New varieties developed through years of constant research are the last word in better corn. And when it comes to performance in the field, farmers say they are positively sensational.

Today, we have new early-maturing varieties of FUNK G HYBRIDS (G-6 and G-10) that were especially bred for high altitude areas where the growing season is short. While cold nights of an early fall may stop other corn, these G-6 and G-10 hybrids ripen to full maturity every time.

Then, too, we have 2 new varieties (G-98 and G-99) that have the long-ear characteristics of the famous Lancaster County Sure-Crop variety *plus* the standability and disease resistance you can always depend on in a FUNK G HYBRID. Some of these ears measure as much as fourteen inches in length. No wonder their yields are amazing farmers wherever they are grown.

Hoffman's research program to find new and better varieties of hybrid corn is never ending. If you want to keep pace with the leader, decide now to plant FUNK G HYBRIDS. We have varieties for both husking and silage that are particularly adapted to your local soil and climate conditions. Mail the coupon below for our beautiful booklet printed in full color describing these and other new 5-Star varieties of FUNK G HYBRIDS. It's FREE. There's no obligation.

KOW-KARE ACTIVATED-FEED PROGRAM

Now costs less!

**ECONOMY DRUM
ONLY 33¢ LB.
INSTEAD OF 49¢**

For even the most conservative feeder, the new economy Drum now makes the Kow-Kare build-up program a MUST. The best of grains and roughage are no better than the POWER TO CONVERT feed to milk of each individual cow. The Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D in the famous tonic supplement, now so nominal in cost, can work wonders in promoting healthy digestion and assimilation. For average producing cows a one-week-a-month program is usually ample. For freshening cows a one-month build-up is recommended.

Whatever the size of your herd there's a size Kow-Kare for you.

A SPOONFUL PACKS A WALLOP

Its use is an investment; not an expense. If your dealer does not have the Drum, he will get it for you quickly. Order now.

DAIRY ASSOCIATION CO., INC.
LYNDONVILLE 12, VERMONT

Grass on the Giles Brothers farm at Moira, N. Y., matured so fast in last spring's drought that it had to go into the mow instead of the silos. Shown taking a breather between buck-rake loads are, from left, Charles and Lyndon Giles and their nephew, Robert Andrews.

Brewer's Grain, Beet Pulp and Molasses for Roughage

WHEN they ran short of grass silage for their 60 head of purebred Guernseys last spring, Charles Giles and his brother Lyndon of Moira, Franklin County, N. Y., substituted brewer's grains mixed with molasses. It worked out fine as far as the animals and production were concerned, and they are glad they had the experience because they're going to have to use a silage substitute all winter.

The June drought and above-normal temperatures matured their meadows so rapidly that before they had a chance to put up grass silage, the grass was hay. Charles said it was practically cured when cut, but that they got a much better yield of hay than they had dared hope when they started cutting. What had been planned for the silos is in the mow, and in place of silage they use a mixture of brewer's grain and beet pulp, half and half, with two cups of molasses added to each bushel as it's fed out.

Although Holsteins are favored by most other farmers in the area, the Giles boys stick to their Guernseys.

Their late father started a Guernsey herd on the farm 45 years ago. They switched over to purebreds when Charles started working with his dad in 1920 and have stuck with them ever since. They used to compete at livestock shows but have been too busy for that these past few years. The boys are busy, too. They have a total of 600 acres with about 250 of them tillable. Since August 1, when their nephew and helper, Robert Andrews, started teaching agriculture, the two men have looked after the whole farm and herd by themselves, plus a lot of the work involved in running their own small retail milk route.

While the drought upset their silage plans—and started their oats heading out when it was only 10 inches high—the Giles boys didn't complain too much about the weather. They were too busy. "Anyway," says Charles, "our pastures are always poor. There is too much swamp. We are looking forward to the formation of a soil district in Franklin County so small farmers will have heavy machinery available for clearing pastures, drainage and so forth."—Jim Hall.

Patents Pending

More Spray Per Hour

NET RETURNS from fruit production are determined in a large measure by the effectiveness with which the operator combines spray materials, labor and equipment to obtain control of insects and diseases.

This quotation was taken from FARM ECONOMICS published by the New York State College of Agriculture. Figures on spraying efficiency are reported as taken on a number of farms. It was found on 3 out of 50 farms, spray was applied at the rate of less than 400 gallons an hour, based on time required for one complete round trip, while on 16 farms, spray was being applied at the rate of 800 gallons per hour.

The report goes on to say that "High rates of spray application usually resulted from a combination of several desirable practices rather than from exceptional efficiency in one element alone. Growers who operated sprayers with pumps rated at 30 gallons per minute or more, combined with spray tanks having a minimum capacity of 500 gallons, were able to apply more spray per day than those having smaller equipment. The use of guns with large discs or brooms with more openings and the employment of additional nozzlemen reduced the time required

to apply a given amount of spray.

"Conveniently arranged water supply points or travelling filling equipment were important factors in diminishing the time spent in 'non-spray' activities. Mixing devices, spray platforms and mounts for holding spray guns or brooms added to labor efficiency and helped to make the job easier."

It's Handy

WINTERIZE THE CAR DOORS

AFTER LATE FALL rains or heavy mists, car doors are likely to stick at the bottom and the locks to freeze so they cannot be turned. A little cup grease rubbed along the meeting strips at the bottom of the doors will prevent much trouble from sticking. A very little denatured alcohol wiped along the top of window glass will help to keep it from freezing shut, but be careful none of it touches the car finish and produces a spot.

When the locks freeze so the key will not turn, hold lighted matches under the key until it becomes as hot as you can hold, then insert it in the

\$2 FOR YOU

Contributions not used will not be returned unless a definite request is made.

frozen lock until it can be turned. To prevent its freezing again, dip the key into denatured alcohol and insert a few times to lower the freezing point of the moisture, then work in some thin oil to keep out further moisture. It will probably stop the trouble for the rest of the winter.

And, of course, frost shields on the car windows make for much safer driving in bitter cold weather. Better see your car dealer as to what is most satisfactory for your conditions.

—I. W. Dickerson.

—A.A.—

NUMBERING MILK CANS

Numbers or letters painted on milk cans are often washed or worn off in time. Try marking them by soldering. Apply the flux with a soft wooden stick the size of a lead pencil. A spot is cleaned on the can in the form of the number or letter desired; then apply the flux, then the hot solder. Following the outline made by the flux makes a number which can be read and will not rub or wash off.—C. E. Swender.

—A.A.—

BETTER NESTS

I have two ideas that I found very handy on nests in a henhouse. The first is a drop bottom in the nests. We hinge the bottom board to the back of the nest and then it is hooked to the sides. This greatly simplifies cleaning. The second idea is to put a wire across the front of the nests one inch above the board which holds nest material in. Hens will not roost on nests after such a wire is installed.—Ray Harrison.

—A.A.—

FOOT TRACTION

When you have to walk on streets that are a glare of ice, try slipping a pair of heavy woolen hunting socks over your shoes and avoid the possibility of broken bones.—H. F. Harley, Albany, N. Y.

—A.A.—

LAWN ROLLER

If you have a lawn roller which you fill with water, use old crank case oil instead. It will be unnecessary to drain it to prevent freezing in winter, and the oil helps to prevent rust.

—Mrs. C. S., Iowa.

4 BIG AND BUSY YEARS

IN RURAL TELEPHONE GROWTH

We've added 1,300,000 telephones

We've strung 615,000 miles of wire

We've built 100,000 miles of pole line

We've invested \$350,000,000 to provide rural service

This tells something of the Bell System's all-out effort to add telephones in the rural areas it serves. And, while building new lines, we are improving service for those who already have telephones. We are reducing the number of parties on a line, and improving equipment to make it easier to hear. Crank-type instruments are being replaced by lift-the-receiver telephones. Progress since the war is truly remarkable — and more is being made every day.

Nantes, Long Strain Carrot

HARRIS SEEDS

"HANDSOME IS AS HANDSOME DOES"

This old proverb certainly applies to our Nantes Carrot, Long Strain. The long, slender, slightly tapered roots have a smooth, handsome appearance. The deep orange colored flesh is tender, fine grained and sweet in large as well as small roots. It is earlier than most good varieties and has no equal for freezing. Popular bunching variety for market gardeners since the small tops, heavy at the crown, do not break easily.

Whether you are a home or market gardener you will want to know about the many new and improved vegetables and flowers offered in our 1950 Catalog.

Stop Losses from **MASTITIS** A Single Infusion of **AUREOMYCIN OINTMENT** *Lederle*

Clears Staphylococcic as well as Streptococcic Mastitis in a high percentage of cases!

AUREOMYCIN OINTMENT *Lederle* is effective against the chief organisms acted on by penicillin plus many other types. In extensive tests among dairy herds, over 86 per cent of mastitis infections cleared up completely within 48 hours after a single-infusion treatment with AUREOMYCIN OINTMENT. All but a small percentage were cleared by a second infusion in 48 hours.

AUREOMYCIN OINTMENT has these advantages:

- MORE EFFECTIVE THAN PENICILLIN
- ACTIVE FOR MORE THAN 48 HOURS
- FREE-FLOWING AND SPREADS THROUGHOUT UDDER
- COWS MAY BE MILKED REGULARLY
- SAFE, WHEN PROPERLY USED
- READY-TO-USE TUBE
- SMALL, ROLLED-IN TIP INFUSION END
- NO SYRINGE OR MILK TUBES
- USUALLY ONLY ONE TREATMENT
- NEEDED (If necessary, repeat treatments at 48-hour intervals.)

Prompt treatment of mastitis with AUREOMYCIN OINTMENT will bring you *quick results in full production* of salable milk.

This product should be used in accordance with instructions in the package literature.

For maximum efficiency in the use of AUREOMYCIN OINTMENT, as well as for best management practices and disease-control procedures, consult your veterinarian.

A folder on AUREOMYCIN OINTMENT will be gladly sent on request.

Dual-Purpose Product Saves More Time for Dairymen

PATIENT years of research have eliminated another time-consuming job on dairy farms. No longer do dairymen have to make up a special chemical solution to control bacteria after the utensils have been washed and scoured. Science has come forth with a new preparation that, with a minimum of work, washes and sanitizes milk utensils in one operation.

"The most dramatic and the biggest step forward in the dairy industry since the advent of the milking machine" is what Dr. George J. Hucker, professor of bacteriology and chief in research at the Geneva Experiment Station, has been told by industrialists and farmers about the new detergent-sanitizers that he and his associates pioneered and which are now in use on thousands of dairy farms.

Kills Heat-Resistant "Bugs"

The new detergent-sanitizers, and there are now many of them on the market under various trade names, are particularly effective against thermophilic bacteria, those stubborn organisms whose numbers are not effectively reduced by the high-temperature, short-time pasteurizing methods now in common use.

Dr. Hucker told me that one of the early proofs of the effectiveness of the new product was its acceptance by 72 farmers in the Geneva area who worked with him in making field tests under farm conditions. "We used four or five different formulas in these tests," Dr. Hucker said. "Occasionally, because of some minor fault in the preparation, we would remove the material from the farm. The farmer would have to go back to his former method of using separate cleaners and sanitizers. Every time this happened, only a day or two would pass before the farmer would be protesting and asking for more of the preparation."

There was one thing Dr. Hucker wanted to get straight for *American Agriculturist* readers. He said, "If you

Dr. George J. Hucker, chief in research at the Geneva Experiment Station, discusses a detergent-sanitizer formula with one of his staff, Elizabeth Winkel.

use lye or if you use heavy alkalies in chlorine — and use them well, you can do just as good a job except for the control of thermophilic organisms." He then added, "But it is time-consuming."

Research Is Slow

Dr. Hucker had been working on detergent-sanitizer research off and on for nine years when he was asked in 1939 to give a talk on "New Things to Come" at a meeting of the New York State Dairy Milk Inspectors in New York City. It was in this speech that he first suggested a combined solution. As he says, "After that the pressure was on us." It took years to find solutions of sanitizing materials that would blend and mix with efficient detergents, but they finally hit on the combination that today is a standard formula used by practically all manufacturers.

The sterilizing quality in the product, including thermophilic bacteria control, is called a 'quaternary' and is made up of four ammonium compounds for which the raw ingredients are found in the fatty acids in coconut oil. The cleaning and blending characteristic comes from some alkali plus one of the new inert, synthetic detergents made under the same basic patent by Rohm and Hass (Triton) and by General Aniline and Film Corporation (An-

(Continued on Page 19)

The Amazing Story of Charlie Hunt's Potato

By W. B. Lewis

Hog Back Road, Dec. 20
Friend Bill:

Got your letter askin' how Charley Hunt got off that Hog Back Road farm, into that nice hardware store, an' a good thing you ask me insted of some one that would lie to you 'bout it, for I can give you the facks for I was livin' next to Charley when you left, you remember.

Four years ago, in March 'twas, Charley's old mare Topsy dide and Charley hollered over to me to give him a hand, an' I goes over an' asts, "Where are you goin' to dig the hole, Charley?" The ground was considerable froze yet an' Charley sez, "'Taint fur back to the clearin' in the woods an' it's soft diggin' there." So we rolled Topsy on to the stoneboat an' hitched on the tractor.

Charley had been feedin' cull potatoes to the stock an' I picked up a sizeable one an' put it under Topsy's left hind foot so's 'twouldnt drag on the ground over the aidge of the boat. It wuz easy diggin' in the soft leaf mold and we soon had the hole an' rolled Topsy in. When we wuz shovelin' in the dirt, I picked up the potato and throwed it in.

Late in June Charley wanted a pole, so tuk his ax an' went back to the woods to get it. Next mornin', Sunday 'twas, Charley comes over an' sez he, "Jake, that potato you throwd in Topsy's grave growd five stalks an' they are higher'n my belt buckle!"

Sez I, "Charley, I know you wuddent tell a lie any quickker'n I wud, but that I got to see," so we went back to the woods.

Well, he warn't lyin' none, and we stood lookin' at the tops, and Charley sez: "You see, this ground is so danged rich, the potatoes all growd to tops and won't be worth diggin', but ain't them some tops!" Charley set down beside them to fill his pipe and all at once he lepped up an' yelled, "Somethin' moved under where I was settin'!"

I thought he wuz kiddin' me an' sez, "Your potatoes got growin' pains or mebbe old Topsy's cum to life." But he got a piece of limb and started scrapin' away the dirt, an' four inches down he uncuvvered some potato skin, an' we both got down on our neese and started scrapin' away the dirt with our han's, an' soon had a piece of skin uncuvvered six inches acrost each way, an' feelin' around under the dirt with our fingers we cudden't find any aidge to the potato.

Charley sez: "Jake, I got the biggest potato ever growd, an' I'll take it to the State Fare an' go on the Midway

an' charge admission to see it, an' you keep still 'bout this an' help me an' I'll give you a share of the munny, 'cause iffen the news leaks out somebody will dig it overnite." So we packed the dirt back with our han's an' scattered some light brush over it careless like.

Charley sez, "That was one of them early kind, Jake, an' it will be plenty reddy to dig in time for the Fare, which is second week in Sept. By the twentyeth of August the tops had dide down, an' we pulled them an' hid them in some brush, an' them tops wuz as big thru as your rist. Then we put some burlap over the aidges of our hose so's not to scratch the potato skins eny, an' started pullin' the dirt off. It wuz only one potato an' it wuz six an' a half feet long an' four feet wide an' near's we cud tell it wuz three foot thick. We put the dirt back on and scattered the brush back over the dirt an' got out of there quick 'fore annybody come along an' see us.

Charley had rigged up a contrapshun on his ditch digger to lift stone, so first of Sept. he takes it back to the woods an' I follers with his two tun truck an' we put some straw on the bottom bords of the truck an' a old piece of canvas over it so's not to lay the potato on the bare flore. an' then got the dirt all offen the potato an' dug a tunnel under the senter of it, an' folded 'nuther piece of canvas over five or six times to make it strong, an' passed it round under the potato an' brought it together over the top, an' Charley hooked an' lifted the potato slow an' easy on to the truck an' we cuvvered it over with a canvas an' put the potato tops on the truck an' drove it clear to the back end of his barn flore an' throwd some loose hay over it.

Nobuddy had heppened to see us an' we wuz pretty excited over it. Charley had \$300 in the bank, an' I had \$200, so we went to the bank an' I give Charley my \$200 so's he wud have enough. You remember Emmy, his wife, of course, an' when she found out at time to start fer the fare she wuz crazy to go 'long, so she rode on the truck with him.

Charley told one of the fare officials he wanted a tent on the Midway, an' when he sees what Charley had he sed: "Gosh all Hemlock!" an' got him a tent that he cud drive the truck right in, an' the pepul cud go in one end an' out 'tother end. The oficial had a nice sine made for Charley for \$2, an' the sine sed "World's Largest Potato, 6 1/4 foot long, 4 foot wide and 3 foot thick," an' I have that sine now for proof. The

A MAN-SIZED SPUD—Many will suspect that Mr. Lewis has exaggerated the size of the potato described in the accompanying story—but look at this picture! Honestly, it's a real Aroostook County, Maine potato, slightly magnified by trick photography. Standing beside truck is Larry Thibodeau, Maine Potato Growers' carlot manager.

TAKES 4 GOOD QUARTERS TO MAKE A DOLLAR THESE DAYS

Protect your cows... Keep them milking with these DR. NAYLOR products

FOR BRUISED TEATS, SCAB TEATS, INJURED TEATS, OBSTRUCTIONS

Dr. Naylor's MEDICATED Teat Dilators

A profitable dairy cow must produce from all 4 quarters. Teat injuries lead to udder injuries. That's why thousands of successful dairymen would not be without DR. NAYLOR DILATORS — ready to use at the first sign of teat trouble.

WORK 3 WAYS Dr. Naylor Dilators perform 3 distinct functions:

1. Carry antiseptics into teat canal to help combat infection and inflammation.
2. Furnish soft, absorbent protection to delicate lining of teat canal.
3. Keep the teat open and encourage a normal milk flow during the healing process.

EASY TO USE. Simply keep a Dr. Naylor Dilator in teat between milkings until teat milks free by hand. Dr. Naylor Dilators fit large or small teats.

It's the brightest and most profitable spot on any farm, the "red and white top" Silo!

And hundreds of farm owners know the "red and white top" signifies the **HARDER CONCRETE STAVE SILO**. Yes, a Harder Silo beautifies surrounding buildings. Moreover, under that sturdy aluminum roof are 18 important Harder construction features. To name a few: the Harder front, constructed of heavy reinforced concrete—the durable, easy to open and close Harder swinging doors, made of thoroughly seasoned, especially prepared lumber—the safe and convenient door front ladder—and the roomy chute.

Write Harder for full details today! Find out how the Harder Concrete Stave Silo with its 18 special construction features and its "red and white top" will serve you longer and better at the lowest possible cost.

The **HARDER WOOD STAVE SILO** is equally famous. It's the last word in a modern wood Silo.

Do You Know Your Apples?

By E. R. Eastman

IN THE old orchard on our home farm is a Roxbury Russet tree, and every time I see it or eat one of the rather poor quality apples I think back to my boyhood days when the family took considerable pride in keeping a few Roxbury Russets in the cellar even as late as June, and sometimes July. They were good keepers, but that's about all you could say for them.

Roxbury Russet is one of the oldest apples known in America, originating in Massachusetts early in the 1600's. Another old-timer is Yellow Newtown, probably named for Newtown, Long Island, where there was a seedling tree of the Newtown away back in the early 1700's.

The oldest apple of all is the crab, which was probably gathered by the caveman, perhaps with one hand while he dragged his woman into the cave by the hair with the other! I'll bet he ate the apple, too.

Of course, there are many old-timers among apple varieties, but my favorite is the Northern Spy, which goes back to about 1800. I have been sorry to see this splendid variety gradually disappear because more modern varieties have yielded earlier and more uniformly and paid out better to growers. A good, bright-colored, snappy Northern Spy is in my book the best eating apple of all the seven thousand distinct apple varieties now known.

A number of the other old-time apples which were excellent eating have largely disappeared because they either didn't yield well, were susceptible to disease, or for some other reason didn't pay out. One of the happiest memories of the old home farm was the big pan of apples that always stood on the "settin' room" table from this time of year until spring. What has happened to that good old-fashioned habit? Why don't farm people themselves eat apples like they used to? Even if most of the old orchards have disappeared, fine eating apples are

available, especially this year, in all of the markets. They taste good. They are healthful, and their consumption helps your fellow farmer, the fruit grower. If you don't like to buy small quantities from the grocery, get in touch with some grower friend and buy them by the bushel.

We had a big Red Astrakan tree and also an Early Sweet Harvest. Boy, how I looked forward in the late summer to the ripening of these early apples! The Gravenstein is a good modern summer apple and makes good eating. Among the fall apples are old and new varieties including Grimes Golden, which is colored a bright yellow with russet dots and is good for all purposes.

Jonathan is an old standby, named after Jonathan Chapman (Johnny Appleseed). It is bright red in color, with just the right amount of acid, and also good for all purposes.

The Wealthy, a more recently developed variety for fall, is pale yellow with red splashes, and is also excellent.

When you come to winter varieties, there are all kinds of choices. As already stated, I put the Northern Spy first. The Tompkins County King, when you can get them just right, is my second choice for good eating. The McIntosh, medium to small in size, rich in color, is a big market variety and is preferred by thousands, but personally there are lots of apples I like better.

A couple of old standby winter apples are the Baldwin and the Rhode Island Greening. The Baldwin is a good keeper, makes good salads, good pies and sauces, and is a good baker. It is hard, crispy, and juicy, red in color splashed with yellow or green.

Other fairly common winter varieties of apples include York Imperial, Yellow Newtown (sometimes called the Albemarle Pippin) Winesap, Stayman Winesap, and Rome Beauty.

What kind of apples do you like best? Are you keeping the doctor away by an apple a day?

GROWING GOOD FRUIT

(Continued from Page 1)

over the tree, as is recommended by the College—that is, a place for every limb and a limb in every place—will allow spray materials to get through to some of the pestiferous bugs we have, like Red Banded Leaf Roller, with less pressure and material.

In years of low prices, it may be well to use larger shears and make fewer but bigger cuts in order to get over the orchards. There is no substitute on some varieties for thinning out, especially on Cortlands where the terminal branches tend to thicken up like hair on a dog.

On peaches, it has always seemed to me that on the older trees, the more cutting you do—that is, within reasonable limits—the better your peaches are. On the other hand, the young trees do better without any pruning, or with very light pruning.

On sour cherries, it is always a struggle to decide whether you want a lot of little green cherries that ripen slowly but do add up in tons, or fewer big, red fellows that sell readily and in the end produce almost as much. We had better prune cherries from now on, a little more than we have in the past, especially the old ones. The premium for better cherries may increase as the quantity increases from the younger trees now coming in production all over the country.

We are just now starting out with our new pneumatic pruner which sev-

eral growers have used for two years. It looks as though these tools will do a great deal to increase the productivity of a good man who knows what he is doing. They will increase the damage that a poor worker can do, but it may terminate his employment a little more rapidly because these tools do take some energy and activity to operate.

I found last spring that one of our neighbors who had a power pruner—compressed air—was willing to rent it out after he had his job done. Perhaps some neighbors could get together on something of this sort, although most people want to prune at the same time—on good days.

Moderately heavy pruning is going to be important in the use of new mist or concentrate sprays. Terrific savings can be made with this type of spray if you can get the material where you want it. Some growers who are using newly devised brush pushers that go on manure forks are going to save a lot of time. My neighbor, Carl Ward, who uses some big bulldozer pushers, says, "Do not worry about brush. You can get it out some time."

There is lots more that could be said about pruning and about other angles of growing clean fruit, particularly spraying. Perhaps if my friends do not bear on too hard after reading my comments on pruning, I may have something to say about my experiences with spraying to control pests and diseases.

Longred — New Main Crop Tomato

HARRIS SEEDS

NORTHERN GROWN FOR VIGOR

This past hot, dry summer, Longred again proved that even under adverse growing conditions it is a leader in the Main Crop field, producing a large yield from midseason until frost.

Uniformly deep globe shape—Exceptionally smooth fruits—Rich red color both outside and in—Uniform ripening—Very little cracking—Heavy yields over a long season.

Our Northern grown seed is Certified for vigor, freedom from disease and trueness to type and Hot Water Treated to eliminate the possibility of seed-borne diseases.

Mulching Raspberries To Control Weeds

SEVERAL years' experience has convinced me that the best method of treating raspberries in the home garden is to keep them mulched. In addition to doing away with cultivation and hoeing, mulching builds up the humus content of the soil, and holds moisture so that a dry spell has less effect on yield and quality.

Right now my small patch is well mulched as a result of last summer's additions of grass and weeds. Early in the spring when the yard gets its clean-up, leaves and dry grass will be added. It's easier to mulch before the new shoots start, and they will have no difficulty in pushing up through an astonishing amount of mulch.

Later, after new growth starts, grass and weeds will be added as available, but will be put between the rows rather than in the row where they might injure the new canes.

Finally, after the crop is harvested, the old canes are cut out and burned as well as some of the weaker new canes. At this time, with a little care, more mulch can be put in the row between the new canes that will bear the crop in 1951.

All this sounds like a considerable amount of work. It really isn't, because it takes just a few minutes once in a while and far less time than trying to control weeds with the hoe and cultivator. Besides, the time spent is well paid for in delicious berries of better than ordinary size. Try mulching your raspberries this year.—H.L.C.

—A.A.—

STORING APPLES

AN INTERESTING development in Apple storage has been perfected by R. M. Smock of the N. Y. State College of Agriculture. He has found that the storage life of apples can be increased from 20 to 25 per cent at a cost of 1 cent a bushel.

The apparatus referred to is called a gas mask. It is made in the form of a cylinder and contains a product known as activated charcoal, similar to the product used in army gas masks. The air in the storage room is passed through these cylinders. Gases given off by the fruit which stimulate ripening are removed as well as gases which might cause scald and odors which might contaminate the fruit.

To make this process effective, all of

PESKY RABBITS

SEVERAL weeks ago I put some woven wire around my three blueberry bushes to protect them from rabbits. The wire had been used for several years around some young fruit trees that are now too large to attract rabbits.

If you have blueberries or young fruit trees that are not protected, there may still be time to prevent damage as the open winter up to now has brought relatively little rabbit damage.

If deep snow comes, I intend to take a look at my blueberries to make certain that rabbits can't reach above the wire as the one above is doing with such relish.

—H.L.C.

the air in the storage room must circulate thoroughly. At least one canister containing 1½ pounds of the charcoal must be used for every 200 bushels of fruit and the air must be moved through each canister at the rate of 25 to 35 cubic feet a minute. A small electric blower is used to draw the air through the cylinder.

—A.A.—

BRUSH DISPOSAL

A relatively new solution has been discovered to the problem of disposing of orchard prunings. An attachment known as a "brush chipper" is used on a tractor and is run by power take-off. The brush is pushed into the chipper, where it is thoroughly chopped up. The resulting fine pieces are allowed to remain in the orchard where they eventually rot and go back in the soil.

Another development in fruit growing is the use of elevated platforms attached to a tractor or, in some cases, powered by a small engine to allow workers to get to the tops of trees for pruning and picking without the necessity of changing ladders continually.

The Amazing Story of Charlie Hunt's Potato

(Continued from Page 11)

man fixed a desk an' chair for Emmy to take in the munny, an' Charley stood by the truck to anser questions an' see nobuddy cut any sueveyneers off the potater. First day of the fare it rained all day an' only 'bout 8000 people cum, but Emmy tuk in 2200 half dollars an' rest of the week she sold 6000 to 7000 a day, an' they didn't know there wuz that much munny.

It wuz on Friday that Charley stood outside the tent talkin' to that same official and one of them big shot potater growers from Idyho cums along an' rec'd the sine, an' he ast the official: "Why do you have such fakes on your midway?"

Charley sez, "'Taint no fake. I own that potater."

Sez the Idyho chap: "I've got \$5,000 here to bet against \$1000 there hain't no such potater." An' he puts \$5000 in the official's han's, an' Charley quick puts up his \$1000 an' they went in to the tent.

The Idyho man got on the truck an' raps here and there with his nuckels an' scrapes off bits of skin with his thumbnail an' tried to see how it had bin made up, an' after 30 minutes he

sez: "Well, I giv up, giv him the munny, but it's worth \$5000 to have seen such a potater." Charley tuk the munny an' sez: "You could have seen it fur 50c after the gates opened."

Well, the last day cum an' sum of these seed an' nursery pepul cum to see what they could pick up, an' the official saw them an' told them they should see Charley's potater, an' brought them over an' when they saw 'twarnt no fake they wuz wild to get it for seed. Charley swore he raised it in a clearin' in the woods in rich dirt an' didn't use manure water or put on any new-fangeld fertilizers, an' that was the only potater an' they sed they wud give him \$5000 fer it, an' Charley sez, "For \$5000 you can have truck an' all," an' he an' Emmy tuk the train home an' they had \$29,000, an' he give me \$2000 of it, an' I traded my farm an' the \$2000 for his farm an' Charley got the hardware store. Come over, Bill, an' see it sum day an' I will tell you 'bout the five stalks of corn we growd on Topsy's grave the next year. That potater was nuthin'.

New York Farm Conference Board Presents Farm Legislation Program

THE NEW York State Conference Board of Farm Organizations, representing eight state-wide farm organizations, presents each year a legislative program to the Governor and to the State legislature. As always, any recommendation made must have the unanimous approval of all member organizations.

Here is a summary of the 1950 program as presented by the Conference Board:

ROADS A ten-year program with substantial State aid is recommended so that the towns and counties may provide year-round roads for all farms worth farming.

The problem is no longer exclusively one of getting farmers out of the mud. It is also the problem of getting farmers out of the snow and making cities more accessible to farm people, and rural areas more accessible to the urban population. As a further recommendation, the Conference Board desires a well qualified agricultural engineer in the Department of Public Works to advise concerning construction and reconstruction of the State highway system in order to preserve and improve good farm lands so far as practicable.

FARM MACHINERY A change in the law relative to moving farm machinery is recommended to cover the following points:

1. To permit moving farm implements between 8 feet and 13 feet in width on highways without permits from a half hour before sunrise to a half hour after sunset, and prohibiting the movement of such implements at other hours.

2. That over-sized vehicles should not be transported on State highways after 10 a. m. on Saturdays, Sundays and holidays except on trips of two miles or less.

3. That the State Traffic Commission have the power to post certain danger spots prohibiting the over-sized vehicle between 8 a. m. and sunset.

The Conference Board points out that present regulations are unreasonable, unnecessary, a general nuisance, and do not contribute to public safety.

MOTOR TRUCK REGULATION Changes in the law are requested to give greater flexibility in the movement of certain farm supplies by trucks not certified under the Public Service law.

It is pointed out that much of the short-haul business of fertilizers, lime, grains and feed is unattractive to commercial truckers, and that farmers would appreciate a change to permit motor vehicles used exclusively in carrying fertilizers, lime, grain and feeds to be exempt from the existing law.

GOVERNMENT SPENDING

A pay-as-you-go basis is strongly urged to State government.

STATE CONTRACTS An amendment to the State finance law is proposed so that county farm and home bureaus and 4-H associations will be eligible to make purchases under State contracts and thereby save money.

EDUCATION The Conference Board recommends adequate support of the State Agricultural and Technical Institutes, greater emphasis on secondary education and equalization so far as possible of educational opportunities available to rural young people. The Conference

Board also recommends that the State continue and expand aid in the school lunch program.

WELFARE The Conference Board urges that county welfare departments be required to submit to town boards semi-annual lists of all persons receiving relief, the amount thereof and the reasons involved. They further recommend the use of purchase certificates rather than cash to relief clients and a thorough study to discover possible savings.

STATE COMPACTS Legislation is requested authorizing the Commissioner of Agriculture and Markets to enter into compacts with other states.

The right of the State to enter into compacts with other states for cooperation in orderly marketing of milk is well established, but the Department authorized to enter into such a compact is not clearly defined.

The 1950 legislative program as proposed by the New York State Conference Board covers a wide range of subjects and certainly will get the hearty approval of a vast majority of farmers. Because the legislative programs in the past have been carefully thought out and presented, the recommendations have been followed in a very large number of cases. Judging from past history, the same will be true in the case of the program currently presented by the Conference Board to the Governor and the State Legislature.

GAS TAX The use of motor vehicle registration fees and gas taxes for highway purposes in so far as possible is requested.

SOIL CONSERVATION An amendment to the State Soil Conservation Act is suggested so that district directors can appoint a treasurer and assistant treasurer to handle funds in the district.

WILD LIFE CONTROL The Conference Board recommends that the State Conservation Commissioner be empowered to declare an open season on antlerless deer in the western half of the State where they are damaging crops. Eastern New York and Long Island are omitted because heavy population indicates the necessity of some other solution.

As a further recommendation it is requested that bonafide employees of a farmer have the same rights as their employers in killing, without a license, wild life that is damaging farm property.

STATE FAIR Adequate appropriations for a full-fledged State Fair in 1950 is requested.

INSPECTION Two or more additional inspectors were recommended for the State Department of Agriculture and Markets to permit more complete enforcement of grading and branding laws.

MILK The Conference Board favors the removal of discriminatory taxes on butter substitutes, providing a plan is devised and enforced to make it impossible for such substitutes to masquerade as butter.

STERILITY IN CATTLE An appropriation of \$50,000 (\$18,000 to the Veterinary College and \$32,000 to the College of Agriculture) for research in sterility is requested.

This is the same request as last year when actual appropriation was \$18,000

to the Veterinary College and \$17,000 to the College of Agriculture.

DRUGS Recommendation is made that existing laws be changed to permit the continued sale of certain drug materials for 'on the farm' treatment of livestock disease through stores other than drug stores.

RABIES Adequate appropriation to the Department of Conservation is recommended to prevent spread of rabies by foxes to new areas. Continuation of the existing law authorizing indemnities to owners of farm animals that die from rabies is recommended.

GOLDEN NEMATODE The continuation of the present program of research on golden nematode of potatoes and the compensation for owners of land under quarantine are requested.

EGG LAYING CONTEST An appropriation of \$10,000 to the College of Agriculture is suggested to provide for random testing of poultry at the Horseheads egg laying contest building now unused.

POULTRY DISEASE LABORATORY Two additional poultry disease laboratories are recommended so that all poultrymen in the State may be adequately served.

NEW YORK 4-H LIVESTOCK CHAMPIONS

(Continued from Page 3)

able mention. The chief Jersey competitors of Herbert Staring were John Johnson of Delaware County; Ralph Young, Cayuga; Ralph Bliet, Wayne; Jack Zimmer, Tioga; Frank Bly, Chemung; and Fred Harper, Schoharie.

For Ayrshires, the boys who gave Beryl Walseman the most competition were: Herman Hensel of Genesee; David Porter, Jefferson; Robert Moran, Livingston; Donald Thompson, Ontario; Robert Peabody, St. Lawrence; Charles Sommers, Saratoga; Russell Guard, Washington, Charles Wilkie, Wyoming, and Robert Baisley, Orange.

Among the top contending Brown Swiss members were Charles Carlson, Chautauque; Albert Angus, Fulton; Peter Vrooman, Montgomery; Wolcott Stewart, Livingston; John Cross, Ulster, and Leon Button, Yates.

The more outstanding members in 4-H sheep club work included Richard Bitterman, Erie; Sam Adams, Wayne; Warren Lawson, Livingston; Patricia Pierce, Niagara, and George Barker of Monroe.

Among the hog growers, Sally Matteson, Jefferson; Richard Kahlein, Greene; Norman Prior, Jefferson; Lyle Hughes of Steuben; and Charles Rose, Suffolk, were next in line.

In beef production Bessie Acomb, Steuben; Henry Kading, Dutchess; Wayne Fisher, Wayne; Edmund Gleason, Tompkins; and Robert Long of Seneca County ranked next to Phillip Taylor.

Each year numerous success stories continue to show evidence that club work is resulting in developing many leaders and breeders. Furthermore, each year thousands of rural boys and girls are given an opportunity to develop personally and also to learn the fundamentals of profitable dairy and livestock farming.

NEW YORK FARM & HOME WEEK

The annual Farm and Home week of New York State Colleges of Agriculture and Home Economics at Cornell will be held this year from March 20 to 24.

As usual, there will be a full program of talks, exhibits, demonstrations and conferences on subjects of interest to all farmers in the Empire State.

MINRALTONE HELPS BUILD CHAMPIONS

Douglaston Lady Augusta. Only cow of breed to be classified as Excellent and have four Excellent daughters. One granddaughter sold for \$13,500 — a record price for a Guernsey bred heifer. Another brought \$14,500 — highest auction price for a Guernsey in 1949. A great-granddaughter sold for \$11,500, a record auction price for open heifers; and a half interest in a grandson netted \$15,000.

Famous McDonald Farms Herd Protected Against

HIDDEN HUNGER*

The 1,500 acre McDonald Farms, Cortland, N.Y. has a wide reputation for the all-around excellence of its herd of pure-bred Guernseys, led by the great Guernsey champion, Douglaston Lady Augusta.

Mr. K. C. Sly, manager for J. M. McDonald, owner, has fed Hidden Hunger* fighting MinRaltone regularly since 1943. Mr. Sly says: "As a safeguard for the health of the herd, we have fed Near's MinRaltone for the last seven years. We use a combination of all three recommended feeding methods—free access, premixing and hand feeding."

Now is the time to help safeguard your profits and the health and continued productivity of your stock. Follow the lead of successful dairymen—feed MinRaltone to your herd. MinRaltone protects against Hidden Hunger* because it contains 11 essential mineral elements with Vitamin D. Write for free MinRaltone feeding booklet.

The Question Box

I have a well 12 feet deep and wish to install a shallow well pump. Will a one inch copper pipe be O. K. from pump to well, or would you advise galvanized pipe? I have been told that copper will turn water green.

If copper pipe ever does turn water green, it is not often or much, and makes no difference. I have used one inch drawn copper tubing on my well for about 20 years and like it very much.—E. W. M.

Are there good reasons why more winter barley is not grown?

It has been said that while Wong is an excellent winter barley, it does often result in spotty fields, perhaps because certain areas are poorly drained. Maybe some day we will have an even better winter barley than Wong. In the meantime it is recommended that where used, barley be sown by Labor Day on fertile well-drained soil.

How much barnyard manure should be applied to an orchard?

In mature apple orchards the amount recommended per tree is usually 200 to 300 pounds. In other words, a ton of manure would be used on 7 to 10 trees. Manure should be applied during the winter. If put on in late spring or summer, it will likely retard maturing of the fruit.

Is it worth-while to try to lighten up a heavy garden soil by drawing in sand or gravel?

Generally speaking, this is too expensive to be practical. The soil on an acre to a depth of 7 inches weighs

1,000 tons. You cannot afford to draw in enough sand or gravel to be effective. Anyway, a ton of organic matter is several times as effective as a ton of gravel in loosening up garden soil.

Why is it that many recommendations advise the dropping of grass seed behind the grain drill rather than in front?

In many soils where the grass seed is dropped in front of the drill, the seed is too deep to germinate. The depth will average more nearly correct where the grass seed is dropped behind the drill. If the ground is rolled or cultivated, the seed will be covered lightly, or it will even be covered fairly well by the first rain.

I recently read some reference to "mole drains." I have never heard this name before. What are they?

In some areas a sub-soil plow is used to loosen up the sub-soil, and often a round piece of iron is drawn through the soil behind this plow, leaving a rough passageway which for a time helps to carry off excess water. These are called mole drains.

Is a ton of limestone per acre every 4 or 5 years enough to replace that taken from the soil?

The figures you give make a good general rule to follow and are usually adequate if the first application was sufficient to take care of the requirements. However, it is a good idea to get a test once in awhile. If legumes are grown and if they yield heavily, they remove an enormous amount of lime from the soil each year.

Backing up the classroom studies of vocational agriculture students at the Tully, N. Y., Central School is a shop program under which boys learn to make such things as calf feeder boxes and metal feed scoops. Shown above working on such projects are, from left: Joe Gorny, David Abbott, Ronald Granger and Roy King.

Shown at right is instructor H. E. Allen congratulating John Currie, leading ribbon winner in the Tully Future Farmers group. John won two firsts, two seconds, a fourth, an eighth and grand champion female ribbons for Ayrshires at the Cortland, (N. Y.), County fair, and was awarded sixth place in a showmanship class of 35. At the New York State Fair, John won second, fourth, eighth and thirteenth place awards.

Pride of Your Farm — Guardian of Your Profit

A Craine Korok silo — high spot on any farm. Matchless beauty... strength... the permanence that means true economy... the trouble-free service that means profit — it's all yours in a Korok!

Korok silos are made of vitrified tile units that are acid, rust and rot proof... frost resistant. Inner walls are smooth — there's nothing to hamper free settling. And it's a Craine — backed by a half-century of building experience.

Feeding Laying Hens in Winter

By L. E. Weaver

NOT MANY years back, a discussion of feeding chickens was mostly concerned with *what* to feed, but today's laying mashers are so generally satisfactory that this discussion will be concerned for the most part with *how* to feed and how much.

Merely to put grain, mash and shell-making materials before a flock of chickens is such a simple and routine proceeding that one may wonder, "What's so hard about feeding hens?" Yet with the same feeds and the same hens, one man will obtain a steady high yield of eggs, and another will soon have the flock in a slump, which recalls a recent comment by an experienced and successful poultryman. He said, "I have always thought that high egg production comes about one-third from inheritance and two thirds from good management."

I am not able to say just why the way in which the feed is given to the hens has so much to do with the way they respond. I only know that such seems to be the case.

When I was a boy, Rufus Haskell, retired, was the one man in our neighborhood who got eggs all winter. That was before the days of cod liver oil in mash. When asked how he did it, his stock reply was "I just talk to the hens. I tell them I must have eggs or I can't buy feed, and they understand me." Rufus spent hours with his hens. He knew them as individuals, kept them tame and friendly.

All of which is fine for a backyard flock and an old man with nothing else to do, but what about the man with several hundred or even several thousand hens? Of course he can't take time to "fuss" with his hens. However, there may be other ways of getting results that he can follow. In fact, there must be, for we all know of large flocks that do pour out the eggs all

through the fall and winter. What is the secret?

My guess is that it is a combination of a number of things. On the part of the caretaker, a regular and always-on-time chore routine with his fairly frequent appearance in the laying pens, together with fresh mash, a constant water supply, and a comfortable environment for the hens, plus good breeding, good health and a wealth of curiosity and interest in something to be eaten that seems to be the natural endowment of every healthy hen.

Some Feeding Suggestions

Be sure that the hens always finish the day with full crops. Late in the afternoon give them all the scratch grain (or pellets) they will clean up.

Get them to eat a lot of dry mash. Put it in fresh every day, and only as much as they will eat in one day. Call their attention to the mash whenever you are in the pen. Run your hand or a stick through the mash in the trough. Move the trough, or scatter a small handful of grain on top of the mash. Anything to get the hens to eat a few extra mouthfuls of feed.

Remember that a never-failing supply of water at a moderate temperature is just as important as the feed supply. Empty water fountains mean lower feed consumption, and eventually empty egg baskets.

Feed scratch grain sparingly or not at all in the morning, but give all they will eat at the afternoon feeding.

If grain is left in the litter, examine it closely. If it is all corn, you are feeding too much corn and not enough wheat or oats. Adjust the mixture until all grain is cleaned up, or almost.

On extremely cold days give a feeding of pellets or wet mash. If you are already feeding these regularly, give an extra feeding at some time during the day.

WHAT DO YOU THINK ?

How Readers Start Poultry Flocks

By JIM HALL

ACCORDING to reports from readers in several states, men who have only small, household chicken flocks have as varied procedures for starting them as men with several thousand birds.

Edward P. Barth of R. D. 1, Accord, N. Y., a retired member of the New York City police department, isn't farming on his small acreage but he does start 50 chicks every May. He sticks to local sources as long as he has good luck with them and then raises the chicks "by following the good management practices shown in *American Agriculturist* and other periodicals." The ones that aren't up to par he culls for the table.

Mr. Barth's procedure, even though it's with a few birds, indicates that the small operator, as well as the large, is looking for efficiency and to keep costs down. Many poultrymen probably would say that he loses by waiting so late to start his flock but, on the other hand, he doesn't have cold weather worries. "If they don't lay, eat 'em," is a good motto on every poultry farm, regardless of size.

Another "late-starter" among our readers is Albert Thistlewood of Harrington in Kent County, Delaware. He looks for a clean hatchery and orders out a couple hundred chicks in April, which is late for Delaware.

Likes Early Chicks

Among early starters is Dairyman George L. Mansell of Butler, Pennsyl-

(Continued from Opposite Page)

sier than men getting 25 or 50 chicks, because they have a large investment on which they must show a profit. Foster's 800 chicks are started no later than January, and he buys only from hatcheries that are well known for quality and high laying records.

When you get into larger flocks, such as the 3,800 that Smith D. Taylor of Cambridge, N. H., starts each year, it is really a specialized business. He starts some in November and some in April, and says he buys his chicks only from contest-winning hatcheries. To promote health, laying, and long life, he vaccinates for Newcastle the 10th week and pays very close attention to proper temperatures for the first three weeks. He says it's important to use a good commercial chick starter containing sulfa and he emphasizes good care.

— A. A. —

LADINO CLOVER FOR POULTRY

Feeding trials with pullets at the New Jersey Experiment Station in 1945-46 showed that birds ranging on ladino clover made equally good growth with less mortality and a 14% lower feed cost per bird than birds in confinement. The total feed consumption was cut very little (only about 4%), but a much less expensive mash was fed and a higher proportion of the feed consumed consisted of the cheaper carbohydrate grain feeds. The cheaper mash was used on the assumption that the clover and sunshine would furnish the protein and vitamin elements for normal growth and development.

— A. A. —

WHITE GUINEAS

Jacques Makowsky of Pomfret Center, Connecticut, raises guinea hens, not the ordinary breeds, but African Whites. He has about 20,000 of this breed on his Idle Wild Farm. Coming from a Russian family connected with the aristocracy in Czarist days, the Makowskys moved to this state from New York and entered a specialized poultry field. Theirs is said to be the only farm in the East where White African guinea hens are successfully raised. They bought their breeding stock in Indiana about a year ago.

—Clifford Knight

RANGE GRIT BOX

The task of dispensing grit or lime roll in the poultry yard is made easier with this homemade grit box used by poultryman Edward Thurber, Hillsborough County, Amherst, New Hampshire. The wooden box is 6" square and 24" high. The tray at the base is 3" high and 3" wider than the box. The box is mounted on a stake at the correct height for easy feeding. A board cover keeps the grit from getting soggy during wet weather.—C.L.S.

YOU CAN BE SURE WITH WENE CHICKS FOR EXTRA EGGS FOR MORE MEAT

Top quality means top profits. For over a quarter century Wene strains have been improved through Wene's 5-point breeding program. Breeding birds are selected for size, vigor, production, early maturity and meat characteristics. This assures you of the finest chicks available.

5 doctors prove this plan breaks the laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

FARM ANIMALS NEED SALT PLUS-

■ Salt is vital for farm animals. But salt will not do the job alone. You must feed other minerals to insure healthy profitable herds. And these essential minerals are present—along with salt—in **STERLING Trace Mineral BLUSALT!**

COBALT... lack of cobalt results in loss of appetite, stunted growth in sheep and cattle.

IODINE... regulates functions of thyroid gland and its secretion.

MANGANESE... helps prevent sterility... increases ability of female to lactate.

IRON... essential for healthy red blood... aids in prevention of anemia.

COPPER... essential to convert iron into red blood cells.

ZINC... promotes longer life, better growth.

ASSURE YOURSELF HEALTHY, PROFITABLE ANIMALS!

FEED STERLING

DOWN THE

By J. F. "Doc" ROBERTS

LIVESTOCK prices in 1949 broke back 20 to 40 per cent, with hogs breaking more than that. Meat prices until recently did not break that much or as fast.

The old, old farm squeeze was on, bringing back memories of the 1920's. Thus food became cheap in proportion to average consumer income, even though consumers continued to complain of ten dollar bills evaporating at grocery stores and meat markets—and are still continuing to call for cheaper and cheaper food. I suppose this can be expected no matter how cheap farmers furnish food.

Here is a true illustration. Last fall a livestock commission man, living on a farm, brought in and gave a bushel of pears to one of the union labor drivers at the Buffalo Stock Yards. This fellow went all over the yards grumbling, "What do you think? He brought me no sugar. What does the old fool think I can do with a bushel of pears without the sugar, too?" What is that song we hear over the radio? "How mild, how mild, can a farmer be?" or something of that sort. All this while the general public was taking but a 2% decline in income and many an industry was having the best year ever.

Let's Get Wild

Now as we head into 1950, I see that forecasters are predicting that farm prices will break another 20%, yet they are not predicting that consumer food prices will break that much. This will be the situation, too, unless farmers and their farm organizations get wild in 1950 instead of mild.

Government could do much to lighten the pressure on this squeeze, but conflicting bureaucratic political groups only make matters worse. In the end, just one bad growing year will make

"big" government look petty and trifling.

Food is too important and there is too much of it for any group to take it on. There is a vast difference, as every farmer knows, between the field of moving food products economically, quickly, and well to consumers—who need all that can be produced — and trying to assume control over production, volume and price. The government has yet to learn this. May 1950 bring the light!

Livestock for the year 1950 is in a pretty good position. There may yet be some reduction in price; but it appears that if there is, it will all be within the next three or four months. After that, it is probable the market will stabilize and follow its customary pattern; i.e., working a little higher through the spring and summer, a little lower through the fall, and stronger as winter comes on. At least, I can see no chance of livestock prices breaking another full 20 to 40 per cent in 1950.

Cutting Waste

We are hearing a great deal about farmers cutting their costs of production. I think the next big agricultural step will be in ways and means of stopping waste and of faster marketing. Already I hear glowing reports of preserving silage and hay with sulphur dioxide gas, along with new chemicals for weeds, parasites and so forth. Right now, big trucks are carrying tons of potatoes from our neighborhood to the deep South. This summer they carried green tomatoes south. Trucks large enough to carry a whole carload of livestock are taking these animals from our markets to the eastern seaboard and bringing livestock into our markets from the Midwest and Canada. Refrigerated trucks are carrying dressed beef and calves from our Northeast towns and cities straight into Philadelphia, Boston, and New York City.

Producing economically will more and more mean producing without waste and up to grade, and then getting food to the consuming public quickly and in perfect condition through fewer and fewer hands. 1950 can, and I hope will, show great strides in this direction.

DUAL PURPOSE PRODUCT SAVES TIME

(Continued from Page 10)

tarox). These firms sell only the basic ingredients to manufacturers of the detergent-sanitizers.

Saves Time

In trials run on 60 dairy farms in the State of Delaware, the Rohm and Haas Company recommended: After morning milking, draw at least a pailful of clean warm water through each unit; dismantle the machine and put it and other utensils in the detergent-sanitizer solution (one ounce of powder to 12 quarts of water) for at least half an hour; brush all parts inside and out and then hang up without rinsing. Before evening milking, flush with hot water. After evening milking, the equipment is flushed with the detergent-sanitizer and again stored without rinsing.

In the Delaware trials, which lasted 13 weeks, half the farmers used the combined detergent-sanitizer, and half used a high quality dairy detergent for cleansing followed by a hypochlorite rinse for separate sanitizing.

Pasteurized counts on the second group showed an upward trend during the trial and were marked by rather large daily variations. In the first group, counts dropped as soon as the detergent-sanitizer was put in use and there was less daily variation. The graph on page 10 showing the comparative plate counts of pasteurized milk during the experimental period gives a striking picture of the effec-

tiveness of the detergent-sanitizer compared to that of the detergent followed by hypochlorite.

Most of the departments of health were at first opposed to the combined preparation on the basis of the long held idea that a surface must first be thoroughly cleaned before it can be sanitized. It was just contrary to established doctrine to attempt to accomplish both operations at the same time. Now proof of the products' merits is found in the acceptance of detergent-sanitizers by thousands of dairy farmers.

Volume Lowers Cost

At present the cost of using the detergent-sanitizers is slightly above the cost of using alkaline, chlorine systems but is expected to come down as sales volume increases.

Dr. Hucker gives credit to Dr. N. E. Lazarus of Lazarus Laboratories, Inc., Buffalo, for being first in the country to put a liquid detergent-sanitizer on the market commercially. "He was in my office the day after my New York speech," said Dr. Hucker, "and I consider him the pioneer in the commercial field."

Dr. Hucker has been working with other sanitation problems of the dairy industry during all these years and promises that the detergent-sanitizers are just the first in a series of research projects in sanitation that are going to benefit the dairy industry.—Jim Hall.

BECAUSE

... KLEEN-EZEY has a thermoduric and coliform bacteria kill of 99.99999+% within one minute in water of any hardness.

... KLEEN-EZEY cleans all equipment and utensils quickly and thoroughly... and it prevents milkstone formation.

... KLEEN-EZEY is safe to use—no injury to hands, metal, plastic or rubber.

... KLEEN-EZEY eliminates need for chlorine and lye solutions.

For best results consistently — use KLEEN-EZEY. Thousands of satisfied dairy farmers save time, labor, money.

TIME WELL SPENT

Time taken to read the advertisements in **AMERICAN AGRICULTURIST** is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad," be sure to mention the name of

AMERICAN AGRICULTURIST

Lucky the boy or girl who grows up in a home where books are a part of family living and family fun.

—Photo by Lambert

wildflower hikes, and books on nature study. June is Graduation. Why not books of self-help and guidance? Summer is vacation time and

calls for travel books. What wonderful travels you can take via the armchair in winter if you plan ahead in July and August!

September brings school and a new dictionary, or maybe a one-volume encyclopedia. How about putting a few coins away ever so often in a box that is marked plainly "For Encyclopedia"? The children are growing up. Their class work will go beyond the one-volume reference book. You yourself will need a real set if you are active in club work, and Dad will use it, too. A good encyclopedia is almost a *must* for every family with school children, and especially so in a *reading family*. There will be so many phrases and allusions to look up.

Fall brings the harvest, Hallowe'en with its pranks, and Thanksgiving, all good occasions for book-giving. Then Christmas—and you can look at your crowded bookshelves with pride. Books to read for the first time, books to be re-read with increasing enjoyment.

On the long winter evenings, our family gathers around. It's stormy outside. The wind howls. The snowdrifts climb higher. But here inside,

there are apples, nuts and popcorn to nibble on, and book friends waiting to make our acquaintance or to renew it. I have always enjoyed *David Copperfield*, but I never enjoyed it so much as I did last winter when we read it aloud, taking turns.

Our high school duo, who are quite impressed with their own importance, thought Shakespeare was just a guy who lived way back when — until we read some of his plays aloud, each one choosing a character. Last week I found a stack of books from the local library in my eldest son's room. He was doing some extra reading on the side about England during Shakespeare's time, satisfying the curiosity which had been aroused by the plays we had read. One book always seems to lead naturally to another.

And it isn't just the old classics that we read. We keep abreast of the times. We read the best of the current literature—through the library at first and then we decide whether or not the book is to have a permanent place on our book shelves.

No, we don't read just fiction. Non-fiction can be just as interesting and more thought-provoking. And we've found it so. When the Palestine problem came up, we read histories and geographies, and became better acquainted with the towns and villages that were mentioned in the daily news. And we found much material in the Bible Dictionary and Concordance.

We read books on Russia, China, India. All news gathered from newspapers and magazines is further amplified with a study of the atlas, the encyclopedia, and whatever geography and history books are available.

Poetry is not considered "sissy" in

our family, for we have memorized many stirring verses. And have you ever tried a Verse Quiz in your own family circle? Quote stray verses and ask who wrote it and where it can be found. After flunking a few times, you are going to study and memorize those verses.

Our family verse quizzes had a repercussion recently. Some of our neighbors took part in one, and we discovered that there were many, many poems yet to get acquainted with. Our neighbors read also, we learned.

Our library keeps on growing. We find all sorts of occasions for an excuse to buy a new book.

Jimmy fell out of the apple tree the other day. No bones broken, but quite a few bruises. Yesterday, he added a book to our shelves, a book on First Aid.

"I'm going to be a doctor," he informed us. "Say, Syd, let's pretend you have a broken arm. Here's pictures that show what to do."

And that wasn't all.

I went to the kitchen a few minutes ago and found my high school freshman daughter by the stove, stirring a flavormore concoction.

"Found this old recipe in the book I was reading last night," she said. "Sounded so good, I just had to try it. Taste it, Mom. Isn't it simply swell?"

"Ummm!" I tasted gingerly. "Not bad." It wasn't either. It will make a hit with the family tonight, I know.

"I'm going to try some more of these old-time recipes," Beth said happily.

And this from a girl who has up to now always hated cooking!

There's magic in books. Here's wishing you the same kind of magic—good reading, good friends, good living, good education.

Vegetables in Midwinter - - -

By GRACE WATKINS HUCKETT

VEGETABLES in midwinter may be the high point of the meal, just as they are in lush summertime. A dish of cauliflower and peas, for instance, makes a fine bit of color for the table and gains in flavor if a special sauce is served to douse over each serving of vegetable. One such sauce is

LEMON-BUTTER SAUCE

½ cup butter 3 tablespoons parsley
Juice of ½ lemon (if you prefer)

Melt butter, add lemon juice and blend thoroughly. Add parsley and serve hot with vegetables. An extra dish of lemon-butter sauce may be served on the side.

Another delicious butter sauce suitable for vegetables or fish is a famous French sauce known as

BROWN-BUTTER SAUCE

½ cup butter ¼ teaspoon salt
1 tablespoon chopped parsley Dash of pepper
3 tablespoons lemon juice

Melt butter in frying pan and stir until golden brown. Add chopped parsley, lemon juice, salt and pepper. Serve hot on vegetables, fish or eggs.

Asparagus shortcake, using cheese biscuits, may be just the dish you want for supper or lunch; it is practically a meal within itself. A good Lenten dish.

ASPARAGUS-CHEESE SHORTCAKE

2 to 2½ lb. asparagus ½ teaspoon pepper
(canned or frozen) 2 cups milk
3 tablespoons butter 2 hard-cooked eggs,
1 tablespoon minced onion sliced for garnish
4 tablespoons flour 1 teaspoon salt

Heat canned asparagus or cook frozen asparagus until tender. Melt butter in saucepan; add minced onion

and cook slowly for 3 minutes or until tender. Add flour and seasonings and blend. Gradually add milk, while stirring; cook over low heat until smooth and thickened, stirring constantly.

CHEESE BISCUITS

2 cups biscuit mix 1 cup milk ½ cup grated cheese
Add grated cheese to biscuit mix and

blend. Add milk, mix with fork. Roll out to ½ to ¾ inch thickness on floured board and cut into squares or circles. Bake on a greased pan in a hot oven, 450 degrees F., 12 minutes. Split and place hot asparagus tips between halves. Pour hot cream sauce over the top and garnish with hard-cooked egg

slices. Serves 6 to 8.

Always the homemaker has to be ready with the makings of a satisfying main dish, even if the meat supply happens to be low that day! Here is one that most supply closets could meet on short notice:

POTATOES WITH CRABMEAT STUFFING

6 to 8 medium potatoes 1 teaspoon salt
2 tablespoons butter 2 tablespoons finely minced
¼ cup light cream pimento
1 teaspoon grated onion 1 can crab meat, 6½ oz.
Few grains cayenne 2 tablespoons grated cheese

Clean potatoes and bake in a moderately hot oven, 400 degrees F., about 45 to 60 minutes or until potatoes are done. Scoop out insides of potatoes and mash, adding melted butter, cream, onion, seasonings and pimento. Stir in crabmeat and stuff mixture back into potato shells. Sprinkle with grated cheese, arrange on baking dish and bake at 400 degrees F. for about 10 minutes or until top is browned. Serves 6 to 8.

Cabbage moves up into a higher class when prepared this way:

CABBAGE DELICIOUS

¼ large head of cabbage ¼ cup cream
1 tablespoon butter 1 egg
1 teaspoon salt 1 tablespoon lemon juice

Cook cabbage in boiling salted water until it is just tender—do not overcook. Mix together the salt, cream, beaten egg and lemon juice. Add the cabbage and mix in well. Pour into a buttered baking dish and dot with the butter. Bake in a moderate oven (350 degrees F.) until set. Serves 4.

Asparagus shortcake, using canned or frozen asparagus, makes a fine winter luncheon or supper dish, especially when combined with cheese biscuit, cream sauce and generous egg garnish.

—Photo by National Dairy Council

Allegany County Homemakers Camp at Stony Brook, N. Y., containing recreation hall, dormitories, dining room and kitchen. Here for four days each summer, busy homemakers take time out for fun and relaxation.

A Vacation for Homemakers

By LORETTA SCHELBLE

LOCATED just across the road from Stony Brook National Park, at Stony Brook, N. Y., is the Allegany County Homemakers Camp, where Home Bureau members and their friends find rest and relaxation in the summer time. The attractive lodge pictured above has been used by the campers for the past two years, but the camp itself has been a traditional event since 1928. Some have attended every camp session since then.

Campers come for four days and bring their own fresh and canned fruits and vegetables, eggs, cereals, cakes and cookies. The camp furnishes meat, cheese, coffee, tea, milk, cream, sugar, bread and butter. Only \$1.00 per person per day is charged, inasmuch as campers bring so much of their own food.

The women are divided into several committees, and each committee is responsible for the preparation of one meal. Dishwashing is usually quite a time-consuming chore at any camp, but the campers solve this problem by having each one responsible for wash-

ing her own dishes. Each camper brings her own dishes, silverware, and tea towels, and since each does her own dishes they do not become mixed up.

Crafts are popular at the camp. The 79 women who attended the camp last summer made twelve dozen link leather belts and eleven dozen boondoggle bracelets; also, several hammered copper bracelets and tooled copper foil plaques.

The camp is ideally located because of its nearness to Stony Brook National Park. In the park are facilities for swimming, and two lifeguards are hired to protect the swimmers. There are also many picnic tables and outdoor fireplaces. Last summer the women campers cooked one evening meal outside, and were so enthused with the idea that they cooked breakfast outside the next morning.

Evenings at the camp are fun, too, with recreational activities including organized games and dancing. Husbands and friends get invited to the camp for one evening, and everybody enjoys a square dance.

Two New One-Act Plays

TWO of the winning plays in a recent *American Agriculturist* contest to secure original rural-life plays were **The New Hired Hand** and **What Men Think of The Home Bureau**. We are happy to announce that these very amusing comedies are now in print and available to our readers.

The New Hired Hand is a one-act farce comedy by Marjorie Smith and E. L. Kamareck. In the play, Henry Adams, the Widow Green's hired hand, can't stand her finickiness and decides to leave. "You oughter get married again," he tells her. "Taint but since your husband died that you got so plumb finicky."

When the new doctor, an eligible young bachelor, comes to visit, the widow thinks he has come for Henry's job and tries to employ him as a hired hand. It causes considerable embarrass-

ment for the shy doctor, and subsequently for the widow when she finds out who he really is. However, the situation is finally cleared up, with a most pleasant result for the widow, the doctor, and Henry; not so pleasant for Phyllis Atkins, a determined spinster, who had set her cap for the doctor.

What Men Think About the Home Bureau is one of the funniest skits we have had in a long time, and was written by Ethel Saddlemyre and E. L. Kamareck. It is played by 6 women, three of them impersonating men. The skit humorously dramatizes husbands' tendency to complain even about their most prized blessings. In states where the title of the organization is other than "Home Bureau," the appropriate name can be substituted; also, local Home Bureau projects can be mentioned instead of those referred to in the skit. This skit fills a long-felt need for an amusing Home Bureau play.

Like all *American Agriculturist* plays, these two new ones are royalty free, easy to produce, and are 35 cents a copy. Also on our list at the present time are the following popular plays:

MONEY FOR COLLEGE, by A. M. Drummond and E. L. Kamareck. Once Pa Miller's mind is made up, it's made! Very funny farce with surprise ending. 3 men, 2 women. Scene, farm living-room.

CHRISTMAS ON THE FARM, by E. L. Kamareck. A delightful comedy with some real Christmas heartthrobs and ending with the singing of Christmas carols. 2 men, 3 women (and a chorus of singers offstage, or can use a record player and Christmas carol record). Farm dining-room.

FARM FORUM OF THE AIR, by B. F. (Continued on Page 23)

8 O'CLOCK DATE

By Eleanor Alletta Chaffee

"Hurry, hurry!" cries my heart;
 "Slower," drawls my mind.
 "Never let him know you care—
 Love's not quite that blind."
 "Don't delay too long," my heart
 Sings, "for he is dear."
 "Better late than early," says
 The mind I dread to hear.
 To which one shall I listen?
 Alas, it is too late.
 My careless feet have rushed me
 Into the arms that wait . . .

**Snow
 changes
 this scene . .**

BUT FROST NEVER HIDES IT

During three cold winters, frost has never blocked out the view through this window in the G. W. Arny home, Du Page County, northern Illinois. It is glazed with *Thermopane** insulating glass.

Thermopane has a blanket of dry air sealed in tightly between two panes of glass. The warmer room-side surface of *Thermopane* stays clear when single windows are steamed and frosted. Even at zero you enjoy a clear view of the outdoors.

You can sit comfortably right next to *Thermopane* windows. No chilly feeling. The entire room stays warm with less fuel.

Thermopane stays in your windows . . . storm sash to put up and take down, none to wash and store away. In summer it helps keep heat out, keeps rooms cooler.

For greater comfort, fuel saving and frost riddance, insulate your windows with *Thermopane*. It comes in more than 80 standard sizes for use in double hung, casement and picture windows, made of either wood or metal. Sold by glass and building supply distributors and dealers. For more information, write for complete *Thermopane* book.

Fire Chief—The New RED Petunia

HARRIS SEEDS

FIRE CHIEF THE HIGHEST PETUNIA
 EVER PRODUCED

So striking that the judges of the All America entries awarded it a Gold Medal and the highest score ever given. A dwarf bedding petunia, very uniform in height; the plants being literally covered with rich glowing red blooms which start to appear early and continue throughout the summer.

NO NEED TO WEAR A TRUSS FOR RUPTURE

That Binds, Cuts, Gouges, Slips and Does Not Hold

If you must wear a Truss for Rupture, don't miss this. A Post Card, with name and address, is all you send to W. S. Rice, Inc., Dept. 65-H 13, Adams, N. Y. to get FREE, and without obligation, the complete, modernized Rice Plan of Reducible Rupture Control. Now in daily use by thousands who say they never dreamed possible such secure, dependable and comfortable rupture protection. Safely blocks rupture opening, prevents escape, without need for bulky, cumbersome Trusses, tormenting springs or harsh, gouging pad pressure. Regardless of how long ruptured, size, occupation, or trusses you have worn. TRY THIS, and send your Post Card today.

Economical Cough Relief! Try This Home Mixture

No Cooking. Makes Big Saving.

To get quick and satisfying relief from coughs due to colds, mix this recipe in your kitchen.

First, make a syrup with 2 cups granulated sugar and one cup of water. No cooking needed. Or you can use corn syrup or liquid honey, instead of sugar syrup.

Then get 2½ ounces of Pinex from any druggist. This is a special compound of proven ingredients, in concentrated form, well-known for its quick action on throat and bronchial irritations.

Put Pinex into a pint bottle, and fill up with your syrup. Thus you make a full pint of splendid medicine—about four times as much for your money. It never spoils, and tastes fine.

And for quick, blessed relief, it is surprising. You can feel it take hold in a way that means business. It loosens phlegm, soothes irritated membranes, eases soreness. Makes breathing easy, and lets you get restful sleep. Just try it, and if not pleased, your money will be refunded.

FOR EXTRA CONVENIENCE GET NEW READY-MIXED, READY-TO-USE PINEX!

New NEEDLEWORKERS CATALOG only 10¢

Send for this big, marvelous CATALOG of "Everything for Needlecrafts." Full of needlework ideas! Stamped Goods for Embroidery, Yarns for Knitting and Crocheting, Rug and Quilt Materials, Needlepoint. Send 10¢ with your request to Dept. 414.

BACKACHE, LEG PAINS MAY BE DANGER SIGN
Of Tired Kidneys

When disorder of kidney function permits poisonous matter to remain in your blood, it may cause nagging backache, rheumatic pains, leg pains, loss of pep and energy, getting up nights, swelling, puffiness under the eyes, headaches and dizziness. Frequent or scanty passages with smarting and burning sometimes shows there is something wrong with your kidneys or bladder.

Don't wait! Ask your druggist for Doan's Pills, a stimulant diuretic, used successfully by millions for over 50 years. Doan's give happy relief and will help the 15 miles of kidney tubes flush out poisonous waste from your blood. Get Doan's Pills.

LONGER WEAR FROM CURTAINS

You can get twice as much wear from your window curtains when you make them yourself if you make the top and bottom hems the same width. By giving plain curtains the same width hem at top and bottom, you can reverse them each time after laundering, and you will get twice the wear out of each pair.—B. C.

— A. A. —

A coarse skin on citrus fruit is likely to be a sign of poor quality.

BEST DRESSED GIRLS IN U. S.—These twelve 4-H girls were each awarded a \$300 scholarship by the Spool Cotton Company as national winners in the 4-H Clothing Achievement program, whose objective is to help girls acquire skills and knowledge necessary to plan, select, construct and care for the right kind of clothes for work, school and social events. From left to right, they are: Arlene M. Olson, Hartland, Minn.; Bonnie Lee Needler, Hartford City, Indiana; Joan Engle, Abilene, Kansas; Evelyn Waugh, White Plains, N. C.; Mary Frances Dick, Yukon, Okla.; Bettye Deen, Jena, La.; Patricia Ann Lynch, Gaithersburg, Md.; Dolores Bombach, Las Cruces, N. Mexico; Nancy Boyd, Soddy, Tenn.; Dorothy Jean Stearns, Johnson, Vt.; Wilma Beale, Pomeroy, Washington; and Dorothy Jean Heidman, Sheboygan, Wis.

For three wonderful days, our headquarters will be at the beautiful Hotel Del Coronado at Coronado Beach, California. Its flowered patio, big swimming pool, glorious sunshine, fine meals and charming rooms are things you'll long remember, as well as the fascinating side trips we will take while there into Mexico and to San Diego.

Last Call for California Tour Reservations!

IF YOU have never gone on an *American Agriculturist* tour, you cannot imagine what a wonderful experience it is: the glorious sightseeing; easy, carefree traveling; fine hotels, delicious meals, and, best of all, fun and good fellowship. Like all A. A. tours, this is an "all expense" trip with everything included in the price of the ticket—rail fares, pullmans, baggage transfers, sightseeing, hotels, all meals with the exception of one, and even the tips.

The tour dates are February 18 to March 12, and our popular tour escort, Mr. Verne BeDell, general agent of the Northern Pacific Railway's passenger department, will again be in charge of the party. On the West Coast, we'll see one fascinating place after another: the beautiful cities of Seattle, Portland, and San Francisco; Stanford University; groves of giant redwood trees; old Monterey and the famous 17-mile-drive; Santa Barbara, Los Angeles, Hollywood, Beverly Hills and the beautiful homes of movie stars; Coronado Beach, San Diego; the world-re-

nowned Mission Inn; a trip south of the border into Mexico, and a whole day at the Grand Canyon of the Colorado.

For complete details of the trip, including the exact cost from your point of departure, send for our printed illustrated itinerary. You will be surprised at the reasonableness of the cost. Write today to E. R. Eastman, Editor, *American Agriculturist*, Box 367-T, Ithaca, N. Y. Better yet, if you want to be sure of going, send in your reservation with \$10 deposit at once.

—A.A.—

TWO NEW ONE-ACT PLAYS

(Continued from Page 21)

Tillotson. Amusing take-off of a radio forum and quiz. Offers many opportunities to use names of local persons and places. By changing some of the questions and answers, this skit can be

adapted for use by almost any farm organization. 14 characters, including 5 forum members and 4 contestants.

THE ELECTRIC FENCE, by M. F. Partridge. Short, uproarious comedy, full of action and sure-fire laughs. Takes about 20 minutes to play. 2 men, 3 women, 1 boy. Scene, farm living-room.

A DAY IN THE VINEYARD, by E. Irene Baker and A. M. Drummond. Charming singing-talking-working play with the simple music included in the script. A vineyard setting is suggested, but the play is effective without scenery. 8 women, 2 men, and a baby (real or dummy).

WHO IS WELLINGTON? by Mrs. Carrie Ladd. The Ladies' Aid Society gets excited about the goings-on in the new minister's family, but all ends happily when the mystery is finally cleared up. Living-room. 6 women, 1 man.

NOTHING DOING, by Grace Smith Beers. City widower Seymour Atkins and his daughter Evelyn are summer boarders in the busy farm home of Mrs. Parker, an attractive widow. Atkins, an old beau of Mrs. Parker's, tries vainly to persuade her to leave the farm and marry him. 4 women, 2 men. Farm living-room.

CASH ON HAND, by Grace Smith Beers. Comedy with a bit of mystery. The Browns are an easy-going farm family, but they have an exciting evening keeping track of \$200 which Mr. Brown got for a cow he sold. 2 men 3 women. Farm living-room.

OH, DOCTOR! by M. F. Partridge. Comedy. A meddlesome old maid neighbor steps in to take charge of the Smiths, with surprising results. Lots of laughs. 3 women, 4 men. Farm living-room.

TO ORDER PLAYS, write to American Agriculturist Play Department, Box 367, Ithaca, N. Y., and enclose 35 cents per copy for plays wanted. Send coins, money order, or check. No stamps, please.

—A.A.—

MY COMMUNITY

My community is the place where my home is founded, where my business is located, where my vote is cast, where my children are educated, where my neighbors dwell, and where my life is chiefly spent.

My community has the right to my civic loyalty and to my help in caring for its unfortunate and its needy ones.

My community wants my citizenship, not partisanship; my friendship, not selfishness; cooperation, not distraction; sympathy, not criticism; my intelligent interest, not indifference.

My community supplies me with law and order, trade, friends, education, morals, and recreation.

I believe in my community and will work for it.—From N. Y. State Home Bureau Federation News.

"Goodbye to COFFEE NERVES"

"Since switching to POSTUM I no longer suffer irritability and fatigue due to nervousness—and life's so much pleasanter!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine—a drug—a nerve stimulant. So, while many people can drink coffee or tea without ill-effect—others suffer nervousness, indigestion, sleepless nights. But POSTUM contains no caffeine—nothing that can possibly cause nervousness, indigestion, sleeplessness.

MAKE THIS TEST: Buy INSTANT POSTUM today—drink it exclusively for 30 days—judge by results!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

THE YOUTH'S COMPANION

Left on the Isle of Sands

By CHARLES G. D. ROBERTS

The Story to Here

The Marquis de la Roche, a French nobleman, set sail from France in the spring of 1598 to found a colony in the New World. As colonists, he brought with him a band of French convicts, including Christophe Saintine and his young son Jules, a stowaway. After a long voyage, they reached the Isle of Sands, the most perilous spot in the Atlantic. Deciding to use the island as a temporary prison while he explored the coast of the New World, La Roche left there the convicts and Jules. Provisions were put ashore with them, and in addition they found on the island wild cattle, fruit, and drinking water.

CHAPTER II

FOR A TIME there was occupation and amusement enough for all. Jules took delight in fishing in the lake and in scampering over the island on the back of whatever pony he could capture. Others, when tired of lolling in the grass, hunted the wild cattle and pigs; and as a flint and steel tinder had been left them, they feasted on liberal roasts of fresh pork and beef, and when they were tired of these meats they had another resource in the wild ducks and geese.

This state of affairs lasted until all the tinder was used up. A wild, hot-headed Gascon, undertaking to make a fire and cook a dinner, tried patiently for half an hour to get a light by using withered grass for tinder. Exasperated at his failure, he suddenly started up with an oath, cursed the flint, and hurled it into the sea.

A comrade, furious at the mad act, sprang upon him, struck him in the face, and bore him to the ground; it was then a fight to the death, and the Gascon succeeded in killing his adversary.

The next moment, ere he had fully regained his feet, the Gascon was struck down by a terrible blow from a billet in the hands of Christophe Saintine, who had run up to separate the combatants.

This was the first bloodshed among the islanders; but thereafter the real natures of the men began to appear. Several fatal quarrels followed. Jules, though a favorite with most of the men, would have fared badly on several occasions but for the general respect inspired by his father's determination and physical prowess. The St. Malo blacksmith wielded a sort of half-acknowledged authority over his fellows, and but for his ascendancy the convicts would have found themselves in a state of perpetual feud.

As for Jules, he soon learned a marvelous degree of prudence in dealing with the dangerous tempers of those about him.

By the time they had been six or eight weeks upon the Isle of Sands, the convicts began to expect, with ill-grace enough, the return of La Roche to take them to the mainland. As another month slipped by they began to desire his coming. Yet he came not.

Little by little their eagerness and anxiety deepened. As the chill winds of autumn blew upon them, they began to be consumed with fear lest the

Viceroy had abandoned them, and they did little but watch the empty horizon from dawn till dark.

Jules' spirits fell day by day to a deeper dejection as he marked the anxious furrows increase in his father's face. At last, after a night through which they had shivered and lamented, they emerged from their huts to find the pools hard frozen, and a fringe of thin ice even along the coast.

Then they knew they were deserted—left to their fate.

For a time they were like madmen, shouting and yelling that they were betrayed—that the King had sent them here to perish, in order that he might be no longer at the cost of feeding them. Some swore while others prayed; and Jules clung, sobbing and broken-spirited, to his father.

Christophe Saintine kept a stern silence, thinking bitterly of the heartlessness which could condemn his innocent boy to such a fate; but Jules, at last, suggested that the Viceroy's ship might have been wrecked, or driven to some other part of the ocean. At all events, he was so convinced that the Viceroy could be guilty of no such cruelty as he was now accused of, that he half persuaded his father to a new hope.

The blacksmith, in the midst of a general clamor, thundered a demand for silence, and urged his comrades to be men and to consider what should be done. He declared that all must do what they could to secure themselves against the approaching cold, so that

when the ship should come for them in the spring they might not be found merely a lot of skeletons upon the beach.

What Jules had guessed was indeed the truth. The Viceroy, having found in Acadia a place fit for his infant settlement, set out to return to Sable Island. But a great gale drove him right across the Atlantic, and his ship was wrecked on the coasts of the Duke de Mercoeur, his bitterest enemy. He was thrown into prison and kept there five years before he could get a message to the King; and the fate of his wretched convicts, and of the boy whom by some chance he remembered so vividly as even to recall him by name, weighed him down with a mountain of remorse.

Meanwhile, how was it faring on the Isle of Sands?

There were but forty of the convicts now. Eight more had met their death in brawls. As the weather grew more and more deadly in its severity, the men found it difficult to keep from freezing in their sleep; and Jules, unhardened and homesick, suffered most. For the additional warmth of close crowding, the islanders now slept in two small huts, the chinks of which they stuffed with dry grass and seaweed.

All the provisions left by La Roche had vanished ere this. All the blueberries and cranberries had been consumed, and there was no alternative but to eat the raw flesh of the wild cattle.

At first such fare was regarded with disgust, and Jules went hungry two days before he could overcome his repugnance; but in a little while the men began to relish it; and, indeed, it was a strong and sustaining food.

At last it happened, as the sun went down on a lurid November night, that a frightful hurricane descended upon the island. Hardly had the men taken shelter in their huts when these were blown to pieces like a pack of cards, and the unhappy beings within were left unsheltered in the howling blast.

Seeking the nearest hollow, they all huddled together in the withered grass, each striving to get beneath his fellow to escape something of the searching cold. As for Jules, his father had wrapped him in a thick coat which had belonged to one of the murdered men, and was now busy scooping a hole in the sand that might afford him some more shelter.

That night, though all followed the blacksmith's suggestion and burrowed into the sand in little groups, no fewer than three men died from exposure before morning. But the experience had taught a needed lesson; and they set out to build themselves a better shelter than those with which they had hitherto been content.

They constructed their new shelter in the heart of the island, under the brow of a hillock well matted with grass and vines. Selecting the heaviest wreck-timbers they could drag, they sank them deep into the sand, and made a low-roofed den, half hut, half cave.

In the roof and up the sides they heaped sand and grass, on which they piled bushes, which were kept in place by more beams, well secured. To keep out the pitiless searchings of the icy wind, they lined the gloomy dwelling with hides from the wild cattle; and here all winter they lived like weasels in a burrow.

As their clothes gave out they replaced them with pieces of raw-hide; and soon, in their uncouth garments, their shaggy beards, matted hair, and miserable squalor, they began to look like some kind of nameless monster, as much brute as human.

Their broils became far less frequent as they approached the depths of their misery, and grew more and more dependent upon one another for the warmth which kept their wretched bodies alive. Terror, too, drew them closer together, as the winter storms yelled over their retreat, and the island trembled under the mountains of water that thundered down upon it, grinding off great slices of the beach.

But with the return of spring, and kindlier skies, and indolence and ease, the quarrels recommenced.

For occupation, and to keep up hope, Saintine got the men interested in hunting the seals that swarmed about the island, and in preserving the furs by drying the skins in the sun and washing them with salt water.

Thus the summer slipped away, not all unpleasantly. But no ship came.

Winter returned with all its horrors, and passed, and came again, till they began to calculate that the island had been five years their prison. For most of them it had become their grave. There were now but twelve men left, including Jules, now grown as tall as his father, to possess the great store

There's No Place Like Home

New York City Invaded by Potato and Vegetable Growers

By L. B. SKEFFINGTON

FOR a change of scenery and in recognition of downstate interests, the 15th joint annual convention of the New York State Vegetable Growers Association and the Empire State Potato Club was held in New York City. Number and variety of exhibits and attendance through the three days amply justified the move. Next year the event will swing back upstate, with Buffalo as the probable choice.

Expression and action at the sessions indicated dissatisfaction with current programs for agriculture. Walter F. Pretzer of Cleveland, president of the Vegetable Growers of America, made a plea for self-help rather than government programs to solve the economic ills of the industry.

He said that since the end of the war a larger percentage of vegetable growers have gone broke than in any other group in agriculture. He said that vegetable growers are "the low men on the BAE index; we are eating the last part of our fat, if any. We can do more for ourselves than anyone can do for us. If we can get rid of government interference and are willing to work out our own salvation, we won't need government schemes such as the Bran-nan plan."

Ask Better Grading

Pretzer and other speakers told the growers they will have to do a better job of grading, packing and marketing. The Potato Club in a strong resolution called upon the state to enforce its potato-grading law. It said that a year ago at the Utica convention a similar demand had been made upon the state, without visible results.

After the resolution had been adopted, this was a topic during a forum moderated by Prof. M. C. Bond of the State College of Agriculture. Spencer G. Duncan, assistant director of the State Bureau of Markets, explained the grade-enforcement situation, his remarks centering on three points:

1. Only six men in the department are assigned to enforcement of apple and potato grade regulations. If the department was provided with additional funds and personnel, it could do a better job.

2. Departmental policy is to try to educate growers and packers before cracking down. Usually they are given two warnings of violations before action is taken to assess a penalty.

3. Each prosecution of a violation requires submission of proof, followed by legal action. Each case has to be turned over to the department's legal bureau. There may be delays over which the enforcing agents have no control.

New Officers

Isaac DeHollander of Oswego succeeded Ward A. West of Rochester as president of the vegetable growers. Donald Shoemaker of Rochester, Austin Averay of Syracuse, and Henry Marquart Jr. of Cherry Creek were elected vice-presidents. L. Huested Myers of Albany and John Wickham of Cutchogue were re-elected vice-presidents. William B. Giddings of Baldwinsville, who has been acting as secretary and treasurer for several months, was elected to that office.

T. Kenneth Bullard of Schuylerville and John Youngs of Glen Head were named to the executive committee. Holdover members are Arthur Bradley of Elmira, Paul Work of Ithaca, and Burnett Bush of Kennedy.

The Potato Club adopted new by-laws under which a board of nine directors elected at large is replaced by a 15-man

board elected three each from five regions. The new board re-elected Harold J. Evans of Georgetown, president; William Hodnett of Fillmore, vice-president, and Donald Kent of Andover, secretary and treasurer.

The directors include: Buffalo area, Hodnett, Kent, and Carl Emerling of Boston; Rochester area, Leon Mehlenbacher of Wayland, Wilbur Van Maaren of Honeoye Falls and Morris Butts of Sodus; Syracuse area, Richard Amidon of Lafayette, John Coulter of Canastota, and Evans; Utica-Albany area, Edgar Gagnier of Churubusco, William Leavitt of Gabriels, Willard Allen of Waterville; Long Island area, N. A. Talmage of Riverhead, Reni Wesnofsk of Hicksville and George Strong of Suffolk.

Markets Neglected

Sturges Dorrence, who handles the advertising campaign for Maine potatoes, told a joint session that he was "amazed that New York growers have not developed their great nearby markets." Among other things, he said that government programs, even though they put money in the pockets of growers, leave the industry confused.

This latter fact was indicated by concern over prospective marketing agreements and operation of the current price-support program. Prices being paid by the government for No. 2 grade potatoes generally are much higher than the market price for No. 1 grade. The program has been supporting Number 2 grade and leaving it up to growers to sell their top grade potatoes.

During the forum Byram Leonard of the PMA said the state committee now has decided to buy Number 1 grade where it has direct orders. Potatoes will be sold to livestock feeders at 10 cents a hundredweight for local delivery and 30 cents bagged in cars.

STEBEN CO., N. Y. FARM BUREAU MAPS BIG PROGRAM IN 1950

THE executive committee of the Steuben County Farm Bureau met in Bath Friday, December 30, to close the year's business and to approve the 1950 program, the most ambitious in the history of the organization.

A. E. Scudder of Painted Post was re-elected chairman of the executive committee; Leon Dennis, Canisteo, the Board's vice chairman; and Gerald Kent, Troupsburg, secretary. Other directors are Clair Bennett, Howard; Paul Flanagan, Hornell; Noah Van Wormer, Wallace; Charles Babcock, Prattsburg, and Leon Andrews of Addison.

The intention is to increase the Dairy Herd Improvement Association membership by 25 per cent, to greatly expand reforestation and woodlot management, and to organize a 'green pastures' contest as a means of improving Steuben's quarter million acres of grazing land.

Major events scheduled are the winter meeting and summer tour of the Finger Lakes Grape Growers, the 15th annual Dairy Banquet of March 18, the dairy field day in August, and the 3rd annual Beef Cattle tour.

The 23rd annual Steuben County Potato Growers Convention, scheduled to be held at Cohocton Feb. 9, 10, presents discussion of government farm programs, economics and public policy, as well as talks on growing and marketing the crop. A dozen speakers will participate in the two day conference,

rated as one of the nation's largest meeting of potato growers.

Special programs are planned for the muck and poultry interests, dairy cattle health will be encouraged, a cruise up the St. Lawrence is included, and the usual sheep dipping service offered. As in the past, the office will keep the health records of Steuben's 3,700 dairy herds; will operate an employment service, and act as business headquarters for the county's vast farm industry.

— A. A. —

LEFT ON THE ISLE OF SANDS

(Continued from Opposite Page)

of furs and hides which they had accumulated. But at last their deliverance drew near.

La Roche had succeeded in sending word to the French king. Henry IV was filled with compassion for the unhappy convicts. He ordered a relief expedition to set out with all speed.

It was decreed that Chetodel, who seemed reluctant, should lead the expedition. The pilot obeyed with the best grace he could assume, and after a little delay the rescue ship set sail, with wind and weather favoring.

On just such another morning as that on which he had first set eyes on the Isle of Sands, Jules stood on a rise of the shore and gazed vacantly to seaward. He had no hope, no expectation of deliverance, and even his longings had grown dull and apathetic.

Suddenly he saw a sail on the horizon. His heart began to beat with choking violence, and he gazed, looked away, and gazed again, before he dared let himself believe his eyes.

Then he ran to his father and his fellows.

"There is a ship! There is a ship!" he gasped. "Come to the hill!"

It was a pitiful-looking group which gathered silently on the sandy hill to watch with eyes of passionate yearning the ship which they had no doubt was sailing past them. It seemed to be heading far away to the southward.

After some hours of watching, the ship's course was changed. Soon they knew that she was bent on making the island. Later in the day she came to an anchorage, some miles out, and a boat put in for shore.

Then the islanders broke out in a riot of joy. Jules and his father embraced and sobbed, and told each other they would see once more the little cot outside St. Malo. Others threw themselves down, groveling in the sand, or rushed into the surf to meet their rescuers. That same night they all were taken aboard.

As the weather remained favorable, the ship stayed another day at her anchorage, enabling the islanders to bring off their great stock of skins and furs. Then she made all haste away from a coast so dangerous, and trimmed her course for France.

The breasts of the rescued convicts were now in a tumult of mingled hopes and fears, for they knew not whether it was to fetters or to freedom they were returning.

Sailing up the channel, Chetodel kept a course so close to the French coast that it was thought he was going to make St. Malo; and Jules' eyes grew dim with emotion as the well-known headland loomed into sight.

But no! St. Malo was not their destination. Chetodel kept on as far as Le Havre, and there his passengers were landed.

With hair and beards all untrimmed, and in their coats of hide as they had been when rescued, they were taken straight to Paris and to the King, where, in trembling doubt, they told the whole story of their sufferings. Christophe Saintaine, as leader, spoke for the party; and he was careful to explain that his son Jules was not a convict—a statement which Chetodel at

"NERVES STILL STEADY AT 60"

Switching to Grain Drink can Help Young and Old

"I thought my shaky nerves were due to getting older. But my doctor blamed the caffeine in coffee and suggested a switch to POSTUM. Now my nervousness is completely gone and I sleep and feel so much better!"

Are "coffee nerves" making you uncomfortable? ... Jittery by day? ... Sleepless at night? ... Many people—young and old alike—have found the answer in switching from coffee and tea to POSTUM.

SCIENTIFIC FACTS: Both coffee and tea contain *caffeine*—a drug—a nerve stimulant! So while many people can drink coffee or tea without ill-effect, others suffer nervousness, indigestion, sleepless nights. But POSTUM contains no caffeine or other drug—*nothing that can possibly cause sleeplessness, indigestion, or nervousness!*

MAKE THIS TEST: Buy INSTANT POSTUM today—drink POSTUM exclusively for 30 days. See if POSTUM doesn't help you, too, to sleep better, feel better, enjoy life more! ... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran—100% caffeine-free! A Product of General Foods.

once corroborated.

To King Henry their story proved profoundly interesting. When he had questioned them closely, touching innumerable details as to their daily life on the island, and touching the wealth of hides and furs they had brought away with them, he finally vowed that they should now have a chance to win happier fortunes. He gave each of them a full pardon, with a present of fifty golden crown-pieces, and secured them in the possession of their valuables.

To Jules, as he could not give him a pardon, he made an additional gift of one hundred crowns, declaring at the same time that if he would return to Paris after embracing his mother and brother, he should have a position as one of the keepers of the King's forests.

Traveling was difficult in those days, and long ere Jules and his father could get home, St. Malo had heard of Chetodel's arrival. But as for the names of the scanty band who had survived the horrors of the Isle of Sands, that was something no one could find out; and there was little hope in the hearts of Goodwife Saintine and her big boy Ba'tiste. They tried hard to persuade themselves that one of their dear ones might have returned, but of seeing both again they never dreamed.

Then came a report that the King had pardoned the survivors, and loaded them down with gifts. But in this report there was no word mentioned of Jules.

"There was naught to pardon my boy for! Surely, then, Jules is not among them!" sobbed the goodwife.

Then for weeks came no further tidings. Christophe and Jules, tired of waiting for a ship, had started to walk to St. Malo.

One evening, toward sundown, as mother and boy sat dejectedly eating their poor meal of black bread and cabbage, the wanderers arrived.

The joy of such a home-coming cannot be pictured. We will leave them there and retrace the naked, ill-kept road, with its row of poplars along one side, till we find our way by twilight into the city. (The End)

Kernels, Screenings

and Chaff

By JOHN R. BABCOCK

Editor's Note: Each winter Ed Babcock gets each of his sons, Howard and John, to write the copy for one issue of Kernels, Screenings and Chaff. The January 7th page was written by Howard from his ranch in New Mexico. This page is written by John who, until a few months ago, worked Sunnygables with his Dad and who still has an interest in the Inlet Valley farm of Boots Poelvoorde. John now works in the farm department of one of the nation's oldest and largest radio stations—WLW of Cincinnati.

FOR SEVEN months, I have made Ohio farming my business and life. Sometimes I see the Southern Ohio farm I work with as an outpost of familiar Northeast agriculture. At other times, it is an unrelated geographical spot somewhere between Sunnygables and Howard's New Mexico Ranch.

Actually, the adjustment I've had to make was from the grassland farming of the Northeast to cornbelt farming in the Midwest. I've learned a lot from these folks down here, but it is still hard to take the Northeast out of a northeastern farmer.

First Impressions

I came to Cincinnati to work in the farm department of WLW, familiar to many as The Nation's Station. It's a big outfit. Daytime programs can be heard clearly almost any place in the four states of Ohio, Indiana, West Virginia, and Kentucky late at night. We used to tune 700 in at Ithaca without much trouble.

About 25 miles north of Cincinnati, Station WLW owns a farm. It provides material for many of our broadcasts on farm topics. Quite naturally, I expected to run into a show place swarming with hired help. I've seen other such "experimental" farms owned by big interests.

I guess my face registered the same uneasy surprise that I see in the expressions of so many farm visitors who attend our radio programs at the farm. I thought I had hit the wrong place. Except for a run-down barn that had a top like a scrub bull, it looked like the next place down the road, or any of a dozen other farms in the county.

The "swarm of hired help" turned out to be a man and his wife who are tenants well past middle age, their hired girl, and an old man who was the only steady hired help.

I learned that the farmer worked the place on a fifty-fifty, tenant-landlord basis with no concessions one way or the other. And he was having his troubles same as anyone else.

That day he'd had ten acres of hay caught out in the rain. While we held up his work even more, he patiently stopped long enough to tell of his plight to some quarter of a million noontime listeners. In his Ohio twang, he simply explained that he had struck down more hay than he could handle. He admitted the rain had caught him flat-footed.

I imagine, since the shower was general, that he had a lot of sympathizers; he had some critics; he had some listeners who learned a lesson.

I learned the biggest lesson of anyone. WLW's farm was on the up and up. Listeners who trusted it could learn from its average operation, its successes and failures, far more than

they would from the preaching of a self-appointed radio authority. I also learned that I'd better know what I was talking about before I started passing along any information to farmers.

Everybody's Farm

"Everybody's Farm," as the name implies, is an average Ohio farm . . . not statistically, of course, for I have yet to see the place that includes even half the features of the theoretical average farm. In a nutshell, the operation consists of some 140 acres farmed in an accepted 4-year rotation (high wheat and corn supports have driven many Midwest farms to 3-year rotations). The animal population is made up of about 500 chickens, 50 sheep, and 15 brood sows which yield 2 litters a year. There are no cattle.

Coming here with the influence of Sunnygables, the *American Agriculturist*, and other such basic parts of my background, I practically had a blade of grass in my mouth. It's hard to sell grass in a farming region that grows guaranteed, high-price grain. Even a blunt pencil can show where there is more money in the grain. That can be challenged fairly effectively in our grassy Northeast.

To my thinking, the key parts to Dad's "Unimal" are its udder and beef-cow head (ignoring the comb for a moment). I think the whole conception of soil-building, as it ties into animal agriculture, is the old ruminant. That makes itself evident at Everybody's Farm, where we can put the year's manure production on a ten acre field in a couple of days.

Naturally, I wondered about cattle. The answer was a sensible one. No barn, no money. I was again reminded that the farm had to get along on its own two feet.

Cows For Balance

We are building a barn next spring . . . as simple a one as we can . . . and will start a dairy. This is a step that has long been planned, and only now, when costs are shrinking slightly, have we been able to go ahead.

Trying as we do to reflect fairly typical midwestern agriculture, we need cows, forage and manure to get the operation in a proper "forward motion" balance. More realistically, we need them to build what in the past years has been a sadly abused farm.

Erosion

Lime, fertilizer and a new 4-year rotation have done much to shape up conditions at Everybody's Farm. But the mining of the past is evident. Remembering the occasions that Boots has plowed pastures so steep we had to use a crawler tractor, I shudder to think of the same thing done here. Boots' hill would go through a good rain, even before the crop had come up out of the ground, and show few signs of washing. On some of these midwest farms, the gentlest slope must be terraced and provided with grassland waterways.

We can't even run a road across the rolling fields at Everybody's Farm. It washes out, the first heavy rain.

The difference, of course, lies in the organic content of the soil. I picked Boots' hill for an example, because his

John Babcock (right) and Earl Neal, the farm operator at Everybody's Farm, originate their programs from all over the farm. Here they are talking poultry management over the air. Setting? The farm poultry house. Note that microphone is built into a model ear of corn.

sandy clay closely resembles much of the soil in this area.

In order that I don't seem to be criticizing the Midwest, I will say that there are a great many farms under close conservation supervision. You can see it best from the air, where the contoured grace of curving crop strips marbles the ground below. I would point out, though, that this is done from utter necessity after years of farming that have named this the Cornbelt.

Grass Handicapped

Broadcasting around from various events, I've had a chance to see several excellent stands of hay and pasture. I've seen what were supposed to be the best. *None of them would touch the alfalfa field next to the house at Sunnygables, or any of Boots' improved Ladino pastures.*

Again I don't say that in criticism. Even with plenty of fertilizer and good farming, the Midwest just isn't capable of growing the grass we do in the Northeast. Maybe up there it's our compensation for not having long enough seasons to make the grain crops they do here.

At home, our cool nights, frequent

cloudy days and sparse covering of topsoil are a unique combination that make grass. Maybe it's being a little over-loyal to the old homestead, but Inlet Valley grass even *looks* more nutritious.

Grassland Program

A popular misconception of grassland farming is that it means a farm's total production is switched to grass. Out here, I think we can illustrate very well where grass can be the hub of crop plans, holding its own in nutrient production, and actually helping a sizable acreage of row crops as it builds the soil. *More grass in rotations, and grazing animals will also consume the grain that is now in excess.*

BOOTS' DAIRY

Being in partnership with a fellow 700 miles away is quite a trick. Somehow, it's even hard to lend moral support from that distance. I did manage to visit Ithaca once this fall, and of course was anxious to see how things were going with Boots and his newest dairy.

I found that most of the pitfalls I had thought about and concerned myself with while away had been on Boots' mind, too. He had handled them so well that the old war slogan "Is this trip necessary?" came to mind. But just thinking about the place doesn't contribute much. We'll get together again this winter to make plans, review finances and look over the operation.

There's not much right now that I can do to help him with the work, but at least he'll know I'm worrying with him. There is real satisfaction in seeing the gains made over a previous visit months earlier. But I think Boots has the real reward—watching things grow and develop under his daily work and care.

FESCUE

Down in Kentucky, they are enthusiastic about Fescue 31. In parts of Ohio and Indiana, they are plugging for Alta Fescue. The two grasses have made tremendous gains in the past few years. Frankly, I've not seen much of it around home. Perhaps we're enough better suited to grow legumes that Fescue hasn't a place. I would like to see what it would do, though. I wonder how it stacks up against Brome Grass. Brome isn't too popular in these parts, I think mostly because it is so hard to establish.

WITHIN THE period of a relatively short national existence, our system of responsible private initiative, or the American way of life, has built a nation of the highest rank in world affairs. That exalted position has not been achieved and held by the arbitrary operations of a despot or bureaucracy. Neither is it the material result of collectivism. The ambition and efforts of free citizens and free institutions have built the complicated structure which has served us so well.

In no other land is the standard of living so high; nowhere is there an equivalent abundance of desirable goods; nowhere is such financial or economic strength to be found. If there be in any quarters a disposition to yield to the enchantment of foreign ideologies, socialism or communism, let the tempted call the roll of the nations, one by one, appraise their situations, and judge the merits of the respective systems by the evidence revealed. — Benjamin F. Fairless, President, United States Steel Corporation.

With AMERICAN AGRICULTURIST Advertisers

SOIL TILLER: "The Benefits of Rotary Tillage" is the title of a booklet describing the Seaman Rotary Tiller. Just send a postcard for it to SEAMAN MOTORS, INC., 394 H. 25th Street, Milwaukee 3, Wisconsin.

LIGHT: The problems inherent in trimming fruit trees have been at least partially solved by the J. B. SEBRELL CORPORATION of Los Angeles, California. They are manufacturing sectional light weight aluminum poles fitted with saws, clippers, and fruit pickers so that more work can be done by someone standing on solid ground.

REPELS DEER: THE GOODRICH CHEMICAL COMPANY, 324 Rose Building, Cleveland 15, Ohio, has developed a chemical deer repellent. Tested recently in New Hampshire, the use of 8 pounds of Good-Rite x.i.p. to 40 gallons of water put on beans by airplane at the rate of 5 gallons per acre repelled the deer and prevented damage.

FOR BUGS: You will be interested in a new booklet called "How to Use Columbia Para-dichlorobenzene." This is available to any AMERICAN AGRICULTURIST reader. All you have to do is to send a postcard to the Columbia Chemical Division of the PITTSBURGH PLATE GLASS COMPANY, Pittsburgh 13, Pennsylvania. The booklet tells how to use the chemical for controlling peach tree borers, clothes moths, and many other uses.

NEW SILO: A new vitrified tile silo "priced within the reach of all" has just been announced by CRAINE, INC., of Norwich, New York. A contest with prizes up to \$500 in cash credits is being conducted to find an appropriate name for the new silo.

ORDER EARLY: THE G. H. GRIMM COMPANY of Rutland, Vermont, reminds readers that a shortage of materials indicates the importance of ordering maple sugar equipment early.

FLY SPRAY: The Niagara Chemical Division of FOOD MACHINERY AND CHEMICAL CORPORATION have a new dairy barn spray which they call Gam Kil, containing the new insecticide, lindane. Lindane is recommended as a substitute for DDT. It will kill flies which have developed resistance to DDT and Methoxychlor. Information on methods of application are available from the manufacturer at Middleport, N. Y.

WATER: If you are planning the installation of a water system you will find some excellent information in a bulletin which you can get upon request from JACUZZI BROTHERS of Binghamton, New York. You will find a handy coupon for ordering the bulletin on page 6 of the December 17 issue of American Agriculturist.

←A reproduction of the new Sire Pedigree book published by the New York Artificial Breeders Cooperative. The book is 5½ by 8¼ inches, contains 220 pedigrees or proofs of bulls that have been in service at the Association's bull barn, and there are more than 120 illustrations. The book sells for 50 cents and can be purchased from any one of the 121 NYABC inseminators or by writing directly to NEW YORK ARTIFICIAL BREEDERS CO-OPERATIVE, Inc., P. O. Box 528, Ithaca, New York.

Service Bureau

By H. L. COSLINE

NO VESTIBULE!

I noticed in the American Agriculturist of September 3 a note stating that the vestibule between a milk house and barn is no longer needed in New York State. The inspector where we take our milk claims that the Board of Health requires one. We have always depended on what we read in the American Agriculturist and it has never been proved wrong yet, so we would like evidence to prove to the inspector that he is wrong.

The evidence is in the form of a letter from W. D. Tiedeman of the New York State Department of Health. Mr. Tiedeman says:

"Some few months ago, Regulation 17 of Chapter III of the Sanitary Code was amended by action of the Public Health Council. This amendment deleted the words "into a stable or" from that regulation. As the regulation now reads, it is not required that there be a vestibule between the milkhouse and the milking stable.

"I regret that there has been a misunderstanding regarding this. However, we have advised all of our own men and the municipal inspectors throughout the state of this change.

"To the best of our knowledge, the State of New Jersey still requires a vestibule between the milkhouse and stable."

— A.A. —

REPORT CAR ACCIDENTS

Many of our New York subscribers fail to realize that it is necessary to report any automobile accident involving personal injury or property damages of \$50 or over to the Bureau of Motor Vehicles in Albany. Each driver involved must make such a report. Blanks can be obtained from local Bureaus.

Doubtless there are few people these days who drive without liability insurance on their cars. It certainly is risky to be without it. There is no law in New York State which says you have to carry it; but once you have had an accident, the law is such that you must prove financial responsibility before continuing to drive.

In case a driver who is not insured has an accident involving at least \$50 damages, there are three things he must then do. He must post a bond with the Bureau of Motor Vehicles in the amount of the damage done, he must take out liability insurance, and he must report to the Bureau that these two things have been done, or he will be liable to lose his license.

So it's a good idea to be sure you are adequately covered by liability insurance, and then remember that any accident involving injury or at least \$50 damages must be reported to the Bureau in Albany as well as to local authorities.

— A.A. —

STAMP FRAUD

Leo F. Sweeney of Watertown, N. Y., was recently sentenced to two years in a federal penitentiary after pleading guilty to a charge of defrauding stamp dealers through misuse of the mails. He was arrested in Las Vegas, Nev.

It was charged that he obtained the stamps on approval from collectors and then sold them without reimbursing the original owners. By that time, Sweeney had left Watertown, but was eventually located in Nevada.

— A.A. —

SWINDLE BACKFIRES

Recently Richard Monroe Smith was arrested by the F.B.I. in Seattle, Wash., in connection with a \$9,000 swindle of Carl J. Bilek, Perch Lake, N. Y. The swindle took place in Phoenix, Ariz., where it was charged that Smith and an accomplice encouraged Mr. Bilek to bet his life savings on imaginary horse races.

Popular new 30" Light Convertible can be used either as a one or two man unit.

You can cut 'em close to the ground. Buck and limb 'em where they fall. It's double-quick and easy to cut firewood, pulpwood, fence-posts, mine props, sawmill logs . . . to clear land with a Disston Chain Saw.

There is a type of saw to fit your work. You'll get power to spare from the sturdy Mercury engine. Thousands of farm users say the Disston Chain Saw is right . . . saves time and work . . . earns extra money. You'll agree when your Disston Chain Saw Dealer demonstrates. See him.

PROTECTION FOR TENDER UDDER TISSUES

NOTHING BUT
THE BEST IS
"GOOD ENOUGH"

Injuries to udder and teats are major concerns to the careful cow owner who can't afford to gamble on smooth production. BAG BALM brings copious quantities of costly heal-promoting ingredients in its lanolin-loaded base. It meets every healing need in spreading right, staying on and remaining antiseptic-on-contact. Use it for promoting prompt healing of Cuts, Chaps, Wire Snags, Sunburn, Windburn. Great for beneficial massage of Caked Bag, and for superfi-

cial healing jobs on all farm animals. All farm-supply dealers have the big 10-ounce tins of BAG BALM.

"Our **RENOVATED** Pasture was a 'Life Saver' during Last Summer's Drought"

Says **GLEN DEATS**, Manager, **CRARYDALE FARMS**, Hillsdale, N. Y.

FROM WORN-OUT PASTURE TO CLOVER

LIKE THIS: Shown at right, knee-deep in lush legume-grass growth, is Glen Deats, Mgr., Crarydale Farms, Hillsdale, N. Y., whose letter (below, right) tells how this excellent pasture, built on run-down land, provided good yields of high-quality hay and the finest kind of grazing during last Summer's drought.

SEND FOR THIS FREE 32-PAGE BOOKLET

... it tells, in pictures and brief text, how to rebuild run-down pastures—how to prepare the seed-bed—what seed mixtures give best results—discusses good pasture management—how to fertilize for utmost economy. Also contains factual statements from Dairymen and Cattlemen which show it is possible, in as short a time as 60 days, to convert run-down land into the best legume-grass pastures, which provide excellent hay, top-quality silage and the most profitable kind of grazing—even in mid-summer when ordinary pasture fails to maintain profitable production. Note typical results, below:

"FEED COST DROPPED \$80. A DAY

at a time when costs usually go up," says J. L. MacDOUGALL, Mgr., Alderney Brooklawn Farms, Morris Plains, N. J. "That shows how well our pasture, renovated in 1947, paid us the first year. In Fall '48 we top-dressed with 18% NORMAL Superphosphate, 1000 lbs. per acre, and the legume-grass came through the winter in excellent condition. On May 23, '49, we started making silage of the 1st cutting and 4 weeks later the field was ready for grazing. In spite of our driest summer, no rain in 6 weeks, this pasture kept on producing profitably, saving us real money on barn feeding."

J. L. MacDOUGALL, Mgr.,
Alderney Brooklawn Farms,
Morris Plains, N. J.

"OUR 25-ACRE PASTURE, RENOVATED 2 YEARS AGO,

in line with your Soil Service's recommendations, saved us 75¢ per cow per day the first year and has kept on paying us good returns ever since," writes CARL SWENSON, Jr., of Wappingers Falls, N. Y. "During 1949 we pastured 38 purebred Holsteins all during the mid-summer drought and the pasture was so good we were able to make 23 cans daily throughout the entire summer. Regular top-dressing keeps pasture productive—the speed with which our pastures recuperate is amazing."

CARL SWENSON, Jr.,
Wappingers Falls, N. Y.

"THE FIRST CUTTING OF HAY MORE THAN REPAID

the cost of renovating a 12-acre pasture plot in 1948," writes G. E. POLLACK, Mgr., Synthane Corporation Farms, Oaks, Pa. "In 1949 we cut over 20 tons of good clover hay from this 12 acres and it provided excellent pasture for our 60 head of blood-tested Guernseys. In spite of the driest summer in a long time, this pasture is in splendid shape—it's a pasture you'd be proud to show anyone."

G. E. POLLACK, Mgr.,
Synthane Corp. Farms,
Oaks, Pa.

"THIS past Summer, the driest on record, certainly showed the value of renovated pastures," writes Glen Deats, Manager of 700-acre Crarydale Farms—E. T. Bedford, Owner—Hillsdale, N. Y. "For instance, take the 16 acres of run-down land which we renovated by disking and reseeding in Spring 1947. We seeded a Ladino-Alsike-Grass mixture, along with Oats as a nurse crop, and fertilized with AGRICO FOR GRAIN, 400 lbs. per acre. The Oats yielded 68 bu. and about 1½ tons of straw per acre. The straw alone covered the cost of renovating—and we got a fine catch of clover.

"The following June (1948) we cut 2¾ tons of top-quality legume-grass hay per acre from this field and in August got a good second cutting. All the details are in your 'Pasture Renovation' booklet, but I'd like to bring the facts up to date.

"FINEST KIND OF PASTURE DURING DROUGHT!"

"Last December (1948), we top-dressed this renovated pasture with manure supplemented with 500 lbs. of 18% NORMAL Superphosphate per acre. In late May, 1949, we took off a first cutting of 2½ tons per acre of top-quality legume-grass hay from this 16-acre field, before turning in 60 head of pure-bred Herefords for grazing on July 1st. All through the dry weather—6 weeks without rain—this pasture furnished the finest kind of feed, and it provided the bulk of the grazing for 60 head until the last week in October. Although the herd had access to an adjoining 40-acre swamp pasture, it was necessary to drive them off the 16-acre renovated field in order to prevent over-grazing.

"REGULAR TOP-DRESSING PAYS WELL!"

"Your Soil Service and Agrico Fertilizers and 18% NORMAL Superphosphate have helped us transform run-down land into pasture of highest feeding value—pasture that provides good yields of quality hay and excellent grazing. Our experience shows that renovated pasture, top-dressed regularly with Agrico or 18% NORMAL, can be counted on to maintain high-level production, even during the driest weather."

WRITE TODAY for FREE copy of the illustrated, easy-to-read booklet mentioned in Mr. Deats' letter and shown at left, above. And keep our free Soil Service in mind—let us analyze your soil and give you economical recommendations for converting run-down land into the finest kind of legume-grass pasture. Write us today.

THE FARM PAPER OF THE NORTHEAST

What to Do When the CHICKS Arrive

By Monroe Babcock

I'LL START by being immodest and say that I have hatched and sold enough baby chicks to know how they should be handled when they arrive at your farm. But first let me go back a little farther and talk about transporting chicks from the hatchery or post office or express office to your farm.

If the weather is cold, close your car windows with the exception of leaving one open just a little bit. If you take a very long trip

Baby chicks deserve a clean brooder house all ready for them when they arrive.

Take all necessary care to see that chicks are neither chilled nor overheated on the trip home.

you can tell whether the chicks are about right or not by squeezing your hand in between the boxes. If the cardboard is just sort of lukewarm to the touch, the chicks are about right. If the cardboard on the boxes seems to feel quite warm, your chicks are getting too warm in the boxes and they should have more air. If it feels quite cold, perhaps they need a little more warmth.

Also, you can open up the boxes and if the chicks are panting, they are too hot, and you can raise the very devil with them in a hurry if you get the chicks too hot at any time in their lives. If they are huddling just a little bit to the partitions, they are all right. Chicks that have been shipped to you will probably holler their heads off anyway because they are hungry. Chicks that you get from the hatchery may be hollering some, or if they have been freshly hatched they may not be making much noise at all.

Avoid Overheating

Don't let your car, with chicks in it, set in the sun or you will ruin the chicks in a hurry. Don't stack your chicks up in a warm brooder house in the boxes because you will ruin them just as fast. You want to be sure to unbox them just as fast as you take them into a warm brooder house.

Naturally, you should have everything ready for chicks before you get them home. Then you won't have to put the chicks in the kitchen or dining room but can put them directly under the hovers. If for any reason you can't put them under the hovers, put them in a room where the temperature is about seventy degrees, and certainly not more than seventy-five.

Set the boxes up off the floor a little bit, and don't stack them too high. Punch out all the holes in the boxes so they have plenty of ventilation. Open up the boxes and look to see if the chicks are "okay." If they seem to be comfortable and are not panting, they are all right. If they are all huddling against the partitions real tight and crowding their shoulders together, they are too cold. Be sure to look at them and see how they act.

When you start the chicks under the brooder, put papers on top of the litter so they will not eat the litter. Do not, by any means, have open hoppers where chicks can get access to grit or oyster shells, because some

Plenty of clean water is one of the essentials for growing thrifty chicks.

A good set-up for brooding chicks. The house is off the ground to discourage rats; there is a board walk to keep the owner out of the mud, and there is a padlock on the door to discourage thieves. This happens to be a prefabricated brooder house.

chicks, if hungry, will fill up on this material, the crop and gizzard will become compacted and the chicks will starve to death with feed in front of them. You can start chicks for two days on fine chick scratch and then switch to mash, or you can start on mash. Probably you will get a little less "pasting up" on fine chick scratch because it isn't digested quite as rapidly as is the mash and gives the yolk a little more time to complete its digestion.

You don't need to worry about feeding chicks too soon. They won't eat too soon anyway, and just as soon as you get chicks home you should feed them. If they are hungry, they will fill up in a hurry. You should have small water fountains around each hover so they can get at the water and learn to drink easily. I think you should have one small water fountain for each one hundred chicks, and one to each seventy-five or fifty chicks is even better.

Don't forget to put a guard around your coal stove or your oil brooder or electric brooder to keep the chicks in the right place

(Continued on Page 22)

16 times bigger in 8 weeks

This Natural Rapid Growth

Can Only Be Made On High Efficiency Feed

CHICKS do their fastest growing during the first eight weeks of their lives. During this period, the average chick, if properly fed, will increase its weight from $1\frac{1}{2}$ ounces to $1\frac{1}{2}$ pounds. Only a feed of high efficiency can supply the necessary raw materials to maintain this rapid rate of growth.

G.L.F. Chick Starter has a long record of high efficiency in growing chicks fast and well. The high efficiency of G.L.F. Chick Starter is based on the sound combination of college research and actual farm experience. Here are the reasons why this starter has given such outstanding results in growing pullets:

High Energy Value

Recent research has shown that energy is the factor that makes some of the other nutrients in the mash more readily available for quick growth. The high energy value of G.L.F. Chick Starter means higher efficiency—more pounds of growth per pound of feed.

Correct Protein Level

Dozens of research tests and millions of chicks have established 20% as the right protein level for starting baby chicks. Recent tests at Cornell have shown that growth and health are not improved by protein levels either above or below 20%. G.L.F. Chick Starter—a 20% protein mash—contains not only the correct *quantity* but the quality of protein required for rapid growth and health.

High Quality Animal Protein

One of the most recent discoveries in poultry nutrition is the Animal Protein Factor (APF)—a combination of several vitamins and vitamin-like substances essential to growth and health. The high quality animal protein in G.L.F. Chick Starter provides in natural form ample amounts of the A.P.F. needed by baby chicks.

From every point of view, G.L.F. Chick Starter measures up as a high efficiency feed—with a farm-proved ability to grow big husky productive pullets and profitable broilers.

COOPERATIVE G.L.F. EXCHANGE, INC.
ITHACA, N. Y.

17 Million Chicks

Raised Last Year on ... G.L.F. Chick Starter

Other Chick Supplies

It's a good plan to have an ample supply of grit, litter or litter-dri on hand when the chicks arrive. Ask your G.L.F. Service Agency for these supplies.

Unmatched in traction

—that's why most farmers want it!

Only Goodyear Super-Sure-Grips give you:

Maximum Traction from straight lug bars—Lugs extend straight across tire's crown—don't curve toward direction of travel. So you get full-lug pull, longer wear, no wobble.

Better Grip from lugs positioned for pull—Equally sized and spaced lugs are set closer together at shoulder for wedge-like action and soil-squeezing grip.

Deeper Bite from Goodyear OPEN design—Goodyear lugs give clean, full-depth penetration, with no hooks, knobs or elbows to blunt their bite.

It's a fact that no other tractor tire can compare with the famous Goodyear o-p-e-n c-e-n-t-e-r SUPER-SURE-GRIP in traction and pulling power under year-round working conditions.

Proof of that comes straight from the farm. In a recent nation-wide survey, America's farmers voted Goodyear *first choice* by a big margin!

The reasons for Goodyear's superior pulling power are the THREE exclusive features listed in the panel above. Only SUPER-SURE-GRIPS have this combination of soil-biting o-p-e-n c-e-n-t-e-r design and

straight-edged equal-size lugs, properly positioned for wedge-like grip, that gives "the greatest pull on earth."

That's why there is no substitute for Goodyear SUPER-SURE-GRIPS—no "just as good" tire. Goodyear engineers have tested hundreds of tires with all basic tread variations without finding one that equals it in

tractive power, smooth riding and long working life.

So don't be fooled by tires that seem to resemble the farm-proved Goodyear o-p-e-n c-e-n-t-e-r SUPER-SURE-GRIP. The SUPER-SURE-GRIP is the tire most farmers want because it goes where other tires won't—yet doesn't cost you a penny more.

IDEALS FOR AMERICANS

WHEN I WAS a boy, my ideal was Abraham Lincoln. He still is, for each year increases the lustre of his shining armor. My father and many of my relatives were soldiers in the Civil War, and I knew men who had seen Abraham Lincoln and heard him speak. Even our friends of the South, who hated him during the war, came to realize that they had lost their best friend when Lincoln died.

So it is perhaps fitting at this time, near another Lincoln's birthday, and when the Nation is in the midst of another crisis to call attention to some of the things that Lincoln, the man of the people, said:

* * *

"With public sentiment, nothing can fail; without it, nothing can succeed."

* * *

"God must like the common people or he wouldn't have made so many of them."

* * *

No letter of sympathy was ever so well written as the one Lincoln wrote to Mrs. Bixby, a Vermont mother who had lost all five of her sons on the field of battle.

"I feel how weak and fruitless must be any words of mine which should attempt to beguile you from the grief of a loss so overwhelming. But I cannot refrain from tendering you the consolation that may be found in the thanks of the Republic they died to save. I pray that our Heavenly Father may assuage the anguish of your bereavement, and leave you only the cherished memory of the loved and lost, and the solemn pride that must be yours to have laid so costly a sacrifice upon the altar of freedom."

* * *

Here is Lincoln talking again on something that we would do well to think about right now:

"It has long been a grave question whether any government not too strong for the liberties of its people can be strong enough to maintain its existence in great emergencies."

* * *

Think of your own conscience when you read this:

"I desire so to conduct the affairs of this Administration that if at the end when I come to lay down the reins of power I have lost every friend on earth, I shall at least have one friend left, and that friend shall be down inside of me."

* * *

When a congressman criticized Lincoln for his "unseemly laughter," he replied:

"Sir, I say to you that were it not for this occasional vent, I should die."

* * *

When a minister expressed the hope that the Lord was on the side of the North, Lincoln answered:

"I am not at all concerned about that, for I know the Lord is always on the side of the right. But it is my constant interest and prayer that I and this Nation shall be on the Lord's side."

* * *

"I am not bound to win but I am bound to be true; I am not bound to succeed, but I am bound to live up to the light I have."

* * *

To William Scott, a boy arrested for sleeping at his post, the President said:

"My boy, you aren't going to be shot. I believe you when you tell me that you couldn't keep awake. I shall send you back to the regiment. But I've been put to a great deal of trouble on your account. What I want to know is, how are you going to pay my bill?"

The boy, much perplexed, said in his embarrassment that it might be possible to raise as much as \$600 on the home farm.

"No," said Lincoln, "that won't do. You must pay the debt yourself by doing your duty as a soldier."

If I remember correctly, William Scott later was killed in action. He paid his debt!

* * *

Next to the utterances of Christ, I think these by Abraham Lincoln are the finest ever recorded:

By E. R. Eastman

"With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us strive on to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle and for his widow and for his orphan, to do all which can achieve and cherish a just and lasting peace among ourselves and with all nations."

* * *

"We here highly resolve that these dead shall not have died in vain; that this nation, under God, shall have a new birth of freedom, and that government of the people, by the people, for the people shall not perish from the earth."

INJUSTICE TO BOTH DAIRYMEN AND CONSUMERS

THE DAIRY industry was dealt a severe blow by the passage on January 18 of the Senate Bill repealing the Federal taxes on oleomargarine. The tax included 10¢ a pound on colored oleo and ¼¢ on the white product.

Near the close of the session last year the House of Representatives passed a similar bill except that it included some restrictions on interstate commerce in oleo to prevent its being sold as butter. Right there is the point. Dairymen have no real ground for demanding a tax on oleo when it is sold under its own color which is white. It is a grave injustice to both dairymen and consumers when it can be sold to look exactly like butter.

The passage of this bill represents a victory not for the consumer but for a very few large manufacturers of oleomargarine who have spent untold sums in propaganda to convince the consuming public and Congress that the tax should be repealed. Even some senators who voted for repeal of the tax with tongues in their cheeks pointed out that the oleo manufacturers represent a monopoly and that increased use of oleo would benefit those who produced and marketed foreign oils and fats.

Many of the senators who voted for repeal gave little or no thought to the welfare of the dairy industry, which means so much not only to the economic welfare of the whole nation but also to the health of the people. That Congress will listen to the propaganda of the gigantic oleo manufacturers and give so little attention to the welfare of one of America's fundamental industries, dairying, shows how far removed are many members of Congress from any real understanding of or sympathy with the problems of the men who produce the food they eat.

Before the bill becomes law the Senate and House versions must be reconciled, and it may be that the final bill will contain some provisions to prevent oleo from being sold as butter. Fortunately, many of the states, including New York, while not taxing oleo still forbid its being sold as a colored product.

THEY NEED YOUR HELP

ONE OF THE cruelest diseases is infantile paralysis, cruel because it attacks children and young people for the most part, and because it leaves many of its victims crippled for life. Last year the disease dealt the nation a staggering blow. There were upwards of 40,000 new cases in that one year alone.

Established to fight the disease is the National Foundation for Infantile Paralysis, which depends for support upon the March of Dimes campaign. Treatment and care for last year's patients will come to approximately \$31,000,000, and that doesn't take into account the many thousands of polio patients of other years who still require assistance. Nor is there any way of knowing how costly will be polio outbreaks this year.

One of the horrors of the disease is that one never

knows where it is going to strike next. It might be one of your own family; no one is safe. In no better way can you spend a dime or a dollar than in helping to take care of boys and girls who need your help to fight back to a useful life again. Subscribe locally or send your contribution—whatever you can spare from a dime to a dollar or more—to The National Foundation for Infantile Paralysis, Inc., 120 Broadway, New York City.

WHY APPLE CONSUMPTION IS DECREASING

WHEN A consumer goes into almost any grocery store to buy apples, the chances are good that he will buy western apples. That is true even right here in the East where we produce the best quality apples in the world. Why?

Perhaps these figures are the answer. During the 1948-49 apple season, United States apple growers spent about \$700,000 for advertising. Out of this, the State of Washington alone spent \$563,000, raised through a stamp tax levied against each grower on the basis of production. Compared with this, the small sum spent for advertising eastern apples is picayune.

Mr. Beverly Byrd of Winchester, Virginia, son of Senator Harry F. Byrd and Production Manager of the world's largest orchards, said at the New York State Horticultural meeting in Rochester:

"The consumption of apples has decreased 50% since 1909. Consumption of oranges has increased 300%; grapefruit 1,000%; and ice cream 1,500%. The reason is that other producers have carried on a very effective campaign of advertising, and they have stuck together and worked together."

We have good apple marketing organizations like the New York-New England Apple Institute and the Appalachian Apple Service, but apple growers don't support them enough to make much of an impression on the market. Any real future and hope of prosperity for eastern apple growers will have to be based on a different attitude than growers now have toward advertising and selling their product.

CONGRATULATIONS!

FOR THE third consecutive year the Dairymen's League News has won first place as the best paper published by any farmers' cooperative organization in the United States. The contest was sponsored by the National Council of Farmers' Cooperatives.

Those who read the League News will agree with this decision.

EASTMAN'S CHESTNUT

NO ONE who ever lived was better able to tell a story to clinch a point than Abraham Lincoln. One that I remember because it illustrated his point so well has to do with a friend of Lincoln who was suggesting that the President should get rid of Chase, the Secretary of the Treasury, because Chase was personally ambitious and wanted to be President himself.

"He's your enemy," said the friend.

To this suggestion Lincoln replied:

"You were brought up on a farm, were you not? Then you know what a chin-fly is. My brother and I were once plowing on an Illinois farm. I was driving the horse and he was holding the plow. The horse was lazy, but on one occasion he rushed across the field so that even I with my long legs could scarcely keep up with him. On reaching the end of the furrow I found an enormous chin-fly fastened on him and knocked it off. My brother asked why I did that and I said I didn't want the old horse bitten that way."

"Why," said my brother, "that's all that made him go!"

"Now, if Mr. Chase has a presidential 'chin-fly' biting him, I'm not going to knock it off if it will only make his department go!"

AA's Farmers' Dollar Guide

STORAGE HOLDINGS: U. S. onion stocks on hand January 1 were estimated at 8,110,000 sacks of 50 pounds each, compared to 10,102,000 sacks a year ago and a 10-year average of 7,984,000. Official report corrects some recent information which indicated more onions on hand than a year ago. New York State holdings are 1,836,000 sacks; last year, 2,755,000. In Massachusetts the holdings are 55,000 compared to 25,000 last year.

U. S. stocks of **Danish cabbage** on hand January 1 were estimated at 23,700 tons, compared to 43,300 a year ago and a 10-year average of 51,400. In New York, holdings were 20,000 tons compared to 38,000 a year ago.

January 1 **apple** holdings were 26,826,000 bushels, compared to 17,814,000 last year and 29,807,000 in 1948. Figures for Northeast are: this year, Vermont, Massachusetts, and Connecticut, 1,728,000 bushels; New York, 4,684,000; New Jersey, 603,000; Pennsylvania, 1,119,000.

On January 1, U. S. stocks of merchantable **potatoes** were second highest on record. Estimate of holdings was 145,440,000 bushels, exceeded only by January 1, '47 figures of 152,170,000 bushels. January 1 stocks were 7% above last year and 21% above 1948 figures.

PRICE SUPPORTS: One of the unsolved mysteries about price support philosophy is the wide acceptance by farmers of the idea that high level supports will bolster prices in case of a severe depression. Although the relationship of what farmers buy and what they sell is still good—just about parity—evidence is already piling up that price supports are headed for a smash-up.

It appears that a move to dump government-held potatoes is imminent. Potatoes are being offered for export at 1 cent a cwt. U. S. welfare agencies can get them for nothing but must pay the freight and are not interested.

It is doubtful that the 70 odd million pounds of government dried eggs stored in a Kansas cave will ever be used for food. Trouble is anticipated in hog supports. For one thing, support levels are going up—January, \$14.90 per cwt.; February, \$15.50, and March, \$16.20—normal seasonal increases. But hog crop is 10% larger than a year ago and still government is obligated to buy them with ultimate utilization very indefinite.

Is your imagination sufficiently elastic to believe that Congress will continue indefinitely to appropriate larger and larger sums for price supports? Ours isn't!

GOOD WILL: Farmers are rapidly losing what little good will they have had from consumers in the past. The chief reason is the bias and misinformation of many writers in newspapers and magazines.

Here is a summary of the present situation:

1. **Lobbying.** Much is being said about the powerful farm lobby, although farm organizations use less pressure and more facts than any other group attempting to influence legislation. One of our biggest lobbies is now made up of government employees. An example of lobbying by government is the pushing of the Brannan Plan which is condemned by all farm groups except the Farmers' Union.

2. **Oleo.** Dairy groups are pictured as selfishly attempting to withhold a good cheap food from consumers. Facts are that practically all farm groups are willing that the oleo tax be repealed if adequate safeguards are set up to prevent oleo from masquerading as butter.

3. **Soil Conservation.** In many articles read by consumers, farmers are pictured as criminally negligent and standing heedlessly by while fertile soil, the basic resource of the nation, is being rapidly carried to the sea. On the contrary, our farms are continually producing more rather than less food.

The overall attitude of consumers is something like this: In depression times they say, "Aren't farmers lucky! They can always eat what they grow; they never go hungry, and they have practically no expenses." In good times consumers yell to high heaven about 'profiteering' farmers, and, in headline after headline, reference is made to the 'tremendous' profits of farmers.

Good will is an important asset to any group, and much of the increasing ill will toward farmers would disappear if consumers had the facts.—H. L. Cosline.

The Song of the Lazy Farmer

been a long, long while since I last saw him crack a smile; his nerves are shot, his breath comes short, and he drinks tonic by the quart, he even gets wound up so tight he rolls and tosses ev'ry night. Can you imagine anything worth losin' sleep about, by jing?

Get Bigger Yields with FARQUHAR IRON AGE

MORE ACCURATE PLANTING

Farquhar Iron Age Potato Planters, with *exclusive* Band-Way fertilizer placement, assure you greater accuracy and flexibility—greater yields—no matter what your acreage or soil condition. Self-aligning roller bearings provide lighter draft. Rigid construction assures easier, more accurate planting.

BETTER PEST CONTROL

Farquhar Iron Age High Pressure Sprayers insure complete penetration, maximum coverage, lower spraying costs in every row-crop application. Ruggedly built for season-after-season use without breakdowns.

MORE EFFICIENT DIGGING

Field tests prove one man and the *continuous elevator* Farquhar Iron Age Potato Digger get more unbruised potatoes per acre at *less cost!* Hydraulic lift is controlled from tractor seat for quick, easy raising and lowering of frame. Both one and two row models operate in any soil, up or down hill, at conventional tractor speeds.

Farquhar

IRON AGE

POTATO AND VEGETABLE PLANTERS • TRANSPLANTERS
SPRAYERS • DUSTERS • POTATO DIGGERS • WEEDERS
MANURE SPREADERS • CONVEYORS • IRON AGE PRESSES
PLANT AND SPRAY THE IRON AGE WAY

YOU'LL always get a *bigger* yield of U. S. No. 1 potatoes at *less cost* when you plant, dig and spray the Iron Age way! See your nearest Farquhar Iron Age dealer... tell him how many acres you plant each season... he'll be glad to give you complete information on the Farquhar model that suits your own particular growing needs.

Grow Better Truck Crops with Armour's

*The Fertilizer Used
by More Farmers*

Armour's Big Crop* Fertilizers will make your truck crops thrive—produce larger yields of quality vegetables that keep, ship and sell better. That's because Armour's provides the plant food elements needed by truck crops for best growth and development. Balanced, free-flowing, the product of over fifty years' scientific research and field experience—Armour's Big Crop Fertilizers are used by more farmers throughout the nation. See your friendly Armour Agent and order the analyses you need. **DON'T WAIT FOR PLANTING TIME!**

Vertagreen

Armour's complete, balanced plant food made especially for high-income crops.

Double-Strength

More plant food units per bag at lower cost per unit with Big Crop high analysis double-strength fertilizers and Big Crop 45% SUPERPHOSPHATE. Save on handling, transportation, storage.

FERTILIZER WORKS**

Analyzing the Apple Outlook

By E. Stuart Hubbard

President, New York State Horticultural Society

EVERY apple grower, I am sure, is puzzling and mulling over the present apple situation and what the future may promise. There are so many conflicting pertinent factors that the situation may well seem hopeless.

Suppose we go back in history and see what hard times apple growers have had and what they did about it.

My uncle, W. H. Hart, told me how, in the '80s he had three bad years and almost failed. One year there was hail that completely ruined his apples and peaches. The next year frost completely wiped out all fruit but a few peaches in a high spot. The third year the crop was so huge and prices so low that there was no profit. They came three good years with fair crops, fair prices, and good returns from export shipments.

Again, in the '90s, 1896 saw the biggest apple crop on record with prices of fifty cents a barrel in New York City. In 1897 the crop was off. In 1898 I remember that nearly all of the apple bloom in the East was frozen. Apples from the few sections that escaped sold for very high prices. Even small, crooked apples distorted with apple maggot paid well for picking and shipping.

Depression Times

By 1914 production caught up with consumption. Times were bad. There were long bread lines in the cities. We bought the best apples in Western Massachusetts for 75c per barrel for the fruit, and barely made a profit. During the war few apples were exported.

With the close of the war and the resumption of export, prices for apples rose to unheard-of heights. Then the recession came with lower prices for large crops. But frost cut the crop to a record low in 1921 and apple prices soared for those whose orchards escaped the frost.

During these times the labor and material costs of maintaining an orchard were low. If a crop failed one year, the next two or three crops carried it along. There were always some orchards that proved to be marginal and uneconomic and were abandoned.

Today's Problems

Today we find somewhat different conditions. To be sure, when there is a larger than average crop, prices drop below the cost of production for most orchards. Because of an unusual series of frost years, some low orchards have been proven unprofitable and have been abandoned. Others that have been kept going at a loss have shown no profit for this year's crop and will be abandoned as similar orchards were in the past.

We have been cutting such blocks for five years amounting to 12% of our acreage. Some of these trees were on dry spots, some in cold areas. Baldwins and Spies have proved to be unprofitable and are being cut. It costs no more to remove the trees than to spray them for a year or to give a good pruning. The land makes fine pasture. If we leave the trees and do not spray them they menace adjoining orchards. There are a number of orchards in our

(Continued on Page 23)

Fertility Management In Northeast Orchards

MOST commercial orchardists who have recognized the need of increased soil fertility in orchards have adopted some system of fertility management. In order that they may check their systems with the opinions and findings of fruit experts, we are setting forth below recent recommendations made by outstanding authorities at several of the Northeast's colleges of agriculture.

Vermont Practices

A good deal of importance is placed on soil acidity in orchards by Dr. Dale H. Sieling of Massachusetts and C. Lyman Calahan, Vermont extension horticulturist. Calahan says that application of liming materials, including magnesium and limestone, is believed to be of coming importance to area fruit growers. Other important practices the Vermonter enumerates are the use of potash and superphosphate and the practice of mulching with air-dried hay, straw, shavings or sawdust. He points out that with proper use of these materials the fruit grower can improve the soil condition, eventual tree growth and the fruit crop at a reasonable cost.

Maine System

Successful fertility management should supply an adequate supply of tree nutrients and, at the same time, maintain or increase the soil organic matter, according to M. F. Trevett and C. W. Hitz, Maine Crop Specialists. They say these conditions can be met most easily in the sod orchards of Maine by a system of balanced fertilization and tree mulching. Specifically, these authorities recommend:

1. Maintain a hay or straw mulch under the trees six inches deep, or at

least deep enough to smother out most weeds and grasses.

2. Each year apply under each tree one-third pound of nitrate of soda or its equivalent per year of age of the tree.

3. Annually apply 500 to 700 pounds of a 7-7-7 fertilizer between rows.

4. Apply magnesium limestone to the orchard floor whenever the need is indicated by soil tests.

5. Watch the trees for hunger signs. (A tree usually is hungry for nitrogen when it has off color or small leaves, or short terminal growth. Shriveling older leaves and yellowing between veins may indicate magnesium deficiency.)

Borax in Connecticut

Advice on the use of boron comes from Arthur C. Bobb, extension fruit specialist at Connecticut. He says orchardists should check boron needs by soil testing, and then apply borax where needed in April every third year. The amount to apply is based on the diameter of the tree trunk a foot above ground. His recommendations per tree, for different diameters, are: Up to 2½ inches, none; 3½ inches, 2 ounces; 5 inches, 4 ounces; 7 inches, 6 ounces; 10 inches, 8 ounces; 14 inches, 8 to 12 ounces; more than 14 inches, 12 to 16 ounces.

Massachusetts Acidity

Dr. Sieling says, "Before the orchardist uses fertilizer to increase production, it is necessary that he correct the acidity of extremely acid soils with dolomitic limestone or other neutralizing materials." He says that neutralizing excessive soil acidity brings about the following: Increased supply of available calcium and magnesium if

Your crops get a GOOD start with McCORMICK Tillage Tools!

A good *seedbed* for good seed is double assurance of a profitable harvest. In the complete McCormick line, you'll find just the right tools to suit *your* soil, *your* climate, and *your* crops. Each is available in sizes to match your tractor, assuring rock-bottom production costs. For top values in tillage tools, always see your International Harvester dealer *first*.

Twice the work in half the time. Make one trip do the work of two! All McCormick disk harrows can be equipped with a special hitch to pull a second tillage tool, such as this McCormick peg-tooth harrow.

Extra clearance is provided both above and below the tooth bars on McCormick tractor spring-tooth harrows. Pivot mountings give tooth bars and teeth extra self-cleaning action. Widths from 4 feet 6 inches, to 15 feet 9 inches.

Seedbed in a hurry! Heavy-duty tandem disk harrow with cut-out disks cuts and mixes soil and stubble, cover crops or trash. Once over makes a good seedbed for drilling small grains or grass.

Fast work on small farms. Four-foot tandem disk harrow with 16-inch disks gives you big-farm quality work with inexpensive, small-farm power such as Farmall Cub tractor. Works 10 to 14 acres per day.

Now! Fingertip angling and de-angling with Farmall hydraulic Remote-Control for popular McCormick tandem disk harrows, 5 to 10-foot widths. You set the disk gangs at just the right angle, or straighten them, without stopping the tractor.

Generous weight makes McCormick peg-tooth harrows exceptionally efficient in smashing clods, smoothing and firming the soil, or breaking heavy stalks. One to 6 sections; open or closed end; rigid, flexible, or wood bar types.

FREE INFORMATION!

Send coupon for full information about the McCormick tillage tools that will help you most. Check items on which you would like complete descriptive information.

NEW Ventilated Bale

.....New Era in
**STILL HIGHER
QUALITY HAY**

**CURES FASTER AND
MORE UNIFORMLY**

**SAVES MORE NUTRIENTS,
VITAMINS, MINERALS**

**MAKES MORE MEAT
AND MORE MILK**

**SLICED FOR EASY
FEEDING**

**WIRE-TIED FOR
BETTER HANDLING
LOADING, SHIPPING**

**VENTILATED TO
KEEP HAY RICHER
FRESHER**

● These air tunnels let cooling, curing air circulate clear through the bale, end to end. They go right through the dense center of the bale, where air does the most good. Final curing in the bale is faster, more uniform. Hay is kept greener, softer, sweeter—retains more of its feeding values, saves grain and concentrates.

For two years, one of the state agricultural colleges compared ventilated bales with ordinary bales. Tests included several lots and kinds of hay, also a variety of weather—some very poor for hay curing. Expert hay graders found that the ventilated bales averaged consistently higher in grade by official standards.

The Case "NCM" Slicer-Baler for 1950 makes ventilated bales—and it's the only baler that does. It's the proved baler, already used by more farmers than any other. And remember—it's the slicer-baler that costs a lot less to own. Avoid waiting on others—see your Case dealer about having a Slicer-Baler of your own.

Case Trailer-Mower hooks up quickly to any modern tractor, makes square turns without backing, takes 7-foot swath, cuts up to three acres an hour. Case also builds mounted mowers.

Case Tractor Rake has four-bar reel for clean raking, geared slow to handle hay gently at tractor speeds. Builds high, narrow, fluffy windrows for fast, even air-curing with little exposure.

Their appetite proves that green, sweet hay, air-cured in the bale as well as the windrow, is rich in the feeding quality that pushes production with less need for grain and supplements.

NEW VENTILATED BALE
Puts More Meat on Ribs
More Milk in the Pail

RFD _____ STATE _____

Users say one man with a modern gas-powered portable saw can do as much in the woods as six men with three cross cut saws. Shown above felling a 29-inch tree on the Worcester County farm of Merrill Wheeler at Rutland, Mass., are Iver Freeman and Richard Dole. They're using a 30-inch 2-man Timberhog chain saw manufactured by Reed-Prentice Corp., of Worcester. Timberhog has sizes from 20-inch to 36-inch with all lengths interchangeable.

An \$86 Million "Sideline"

By JIM HALL

SEVENTEEN million acres of farmer-owned woodlands in the Northeast are growing up.

Individually owned woods that just a few years ago were expected to yield little more than fuel and fence posts brought northeastern farmers almost 86 million dollars in 1947.

The decline of virgin stands of timber has increased our dependence on small woodlots to a point where more and more owners recognize in them a substantial extra income. Today, with farmlands containing more than half of the commercial forest acreage in the country, farmers are becoming aware of the need for good forest management. They also are too well aware of the value of their timber to sell stumpage at some of the ridiculously low prices that professional timber operators were wont to offer a few years ago.

The advent of modern in-the-woods equipment and techniques has lowered labor efforts and costs so that more farmers than ever are harvesting their own timber crops of cordwood, lumber and pulpwood. They are becoming their own lumberjacks during winter months when the main farming enterprise interferes the least with the woodlot operation. (Continued on Page 23)

Briggs Tompkins, Pawling, N. Y., is pictured felling a tree on Governor Dewey's Dutchess County farm with a one-man Precision bow saw that he says combines ease of handling and safety in all woods operations. In addition to the bow saw, the Precision Equipment Co., Danbury, Conn., makes straight bar saws of 20, 26 and 32-inch lengths, and an open end 22-inch saw especially for felling and bucking small timber.

The DO-100 engine of Henry Disston & Sons, Philadelphia, powers several of their chain and bow models, from the 18-inch one-man to their 24 and 30-inch saws which are convertible to 2-man use by the addition of a helper-handle. Pictured above on a New Jersey farm is the 18-inch model for small timber and general farm cutting. The Disston Extra-Duty 2-man saw has a 12 h.p. engine and cutting capacities up to 7 feet.

Most of the McCulloch chain saw models are 5 horsepower with 5 blade lengths running from 20 to 60 inches. The one Bob Ereckson is limbing with in the above picture is their model 3-25 which means it has 3 horsepower and weighs only 25 pounds complete with an 18-inch blade. Twenty-four and 30-inch blades and a 15-inch bow saw are interchangeable on the 3-25. McCulloch saws are manufactured in Los Angeles.

The Andrews brothers, Willis C. and James, start a cut to fell a tree on their farm north of Machias in Cattaraugus County, N. Y., with a 30-inch Hornet H-4 saw. The Hornet saws, assembled and distributed by the Tubising Equipment Co., of Buffalo, N. Y., come in many sizes. The one-man models range from 16 to 30 inches, and cutting attachments for the two-man jobs are from 24 to 60 inches long.

The sale and use of portable chain saws have almost reached the spectacular stage in the past few years. When a recent strike threatened distribution of their Woodboss one-man chain saws in the Northeast, the Power Machinery Company, New Canaan, Conn., had 300 saws flown from Vancouver, Canada, to Connecticut. Picture shows plane being loaded with 14, 20 and 26-inch Woodboss 4 h.p. models.

Chain saws are the newest addition to the Homelite "carryable" products manufactured at Port Chester, N. Y. One engine powers all models, including one-man saws with blades from 14 to 27 inches, their 39-pound one-man bow saw, and their two-man 32-inch model. Chain blades can be switched quickly from vertical to horizontal cutting. Shown is the 27-inch one-man model felling a tree on the Reid Estate at Harrison, N. Y.

You'll Plow Easier, Faster WITH A Massey-Harris No. 28

ONE-THIRD of all the horsepower you use is needed for plowing. That's why it is so important to get a light draft plow. The right plow is important for another reason. Good plowing is the first step in making a good crop.

So take a good look at the Massey-Harris No. 28... compare it with other plows. It is packed with all the "know-how" of more than 100 years of fine plow building.

With its exclusive Double "X" Frame the No. 28 stands up to tough soils that twist less sturdy plows out of alignment.

Constant clearance lift raises bottoms to the same high position regardless of plowing depth — saves

time at the end lands.

Cone-type wheel bearings, chilled to extra hardness, easily adjusted for wear, keep the wheels always running true.

Teamed up with your Massey-Harris Tractor — or any tractor — the No. 28 Plow will do more and better plowing, for a longer time, and at lower cost. Your Massey-Harris dealer can show you why. In 2, 3, 4, and 5-bottom sizes. Similar to the No. 28, but without constant clearance lift, is the two-bottom No. 27.

HARRIS SEEDS Delicious to Eat, Easy to Grow

People who appreciate really good food are apt to get ecstatic about this new winter squash with its nutty flavor and fine textured dry sweet flesh which is a bright yellow color. In addition to these qualities, we like to point out the neck of solid meat with no seeds; its convenient "family" size; its good keeping qualities, and the resistance of the vines to the squash vine borer.

GROWING PEAS for the Canning Factory

By C. B. RAYMOND

New York State College of Agriculture

THE growing of peas for processors in New York State shows relatively little change in acreage over the past twenty years. This past season growers had over 30,000 acres under contract, compared with a ten-year average, including the war period, of 35,000. It seems rather unusual that New York State, right here at the front door of the greatest market in the world, should be producing approximately 8% of the total peas for processing, while the production of fresh peas for market has continually declined to only slightly over 2,000 acres, which is about half of the average acreage ten years ago.

The average yield of all peas for processing in this state for the ten year period ending in '47 was, according to government reports, slightly over 1,700 pounds an acre. This is approximately a hundred pounds an acre better than the long term average back in the early thirties and is only about 10% below the average of the entire United States.

Most years there are over thirty firms processing peas at more than forty plants from the Mohawk Valley west to the Pennsylvania line. About a third of the so-called canning plants are quick freezing the peas and several are packing peas as baby food. In recent years, the more rapid highway transportation has enabled processors to extend the acreage farther from their factories, and much of this change has gone into the higher elevations, particularly where soils are well drained.

Little Hand Work

Peas for processing are grown and harvested with probably less hand labor than any other cash crop in this state. The man-labor requirements to grow an acre of peas have always been small, but even this has been greatly reduced in the last five years by development of harvesting and loading machinery. Records on several farms in 1948, when there was a big crop, showed that these growers only used an average of twelve hours of man labor an acre, with the highest only twenty-nine hours. Since warm weather, especially hot, dry weather, causes peas to change rapidly from immature to a too old stage, the harvest is a "must" order of business, once the processor advises they are ready. Loading and harvesting machines have speeded up this operation and are a big help toward improving the quality. The packs of New York State processors have always been primarily of top quality.

Yields and Returns

Since peas for the processors are grown on a fixed contracted price and the labor expenditure is small, the one major factor for satisfactory returns is the ability to get a high yield of good quality peas. While the net returns per acre for processing peas do not reach the high figures of many other cash crops when one is fortunate enough to hit the best markets, neither do they show the risks of much loss. The returns per hour of labor on the other hand are often as good as for most of the cash crops in this state. On the cost account farms that grew peas during the years from '44 to '48, the net returns per acre varied from twenty-one to ninety-one dollars, or, if considered on the basis of hours of labor, the return was from \$1.13 to \$4.04 an hour.

Besides the possible cash returns, there are other very favorable considerations in the growing of processing peas. In the first place, they are an excellent crop with which to seed alfalfa or other meadow or pasture seedings. They are a soil improving crop, leaving the land richer in nitrogen. This practically always shows up in the beneficial effect on the crop to follow. In the early sections of the state, many growers are able to grow another cash crop the same year after the early varieties. Then, too, pea vines are practically always made into silage which has a slightly higher protein content than most other silages.

Varieties

All processors choose the varieties they wish to pack and they supply the seed to the grower. The varieties used depend partly on the trade and partly on the suitability of the soil and climate of the region. More than a dozen varieties are commonly grown. Those for commercial freezing are all of the garden type, which have a dark green seed color, while most of them for canning are the lighter colored seed. Thomas Laxton and Alderman are the principal varieties for freezing, but the latter is being displaced by new varieties that do not grow so large. There are many more varieties for canning, with Surprise and Perfection probably leading the list, but with considerable acreage made up of Canner King, Chief, Pride, Bonneville and others.

Many of the processors have cooperated with the State and County Extension Service in the study of cultural conditions of the fields growing the best crops for four years. Included in this study were only those fields that produced more than an average of 1,700 pounds of peas of top quality as measured by an electrically powered machine called a Tenderometer. Over 1,700 fields of these good crops have been recorded during the four years, and the growers have reported the cultural practices to give some of the most valuable information available on conditions favoring the best pea crops. Only one grower, Mr. H. D. Forward, Jr., of Camillus, Onondaga County, qualified for the Honor Crop classification each of the four years. Fifteen other growers qualified three of the four years. Peculiarly enough, seven of these are in Onondaga County, three each in Ontario and Genesee, and one each in Livingston and Monroe. Best crops each year were well distributed throughout much of the area covered by the survey. A study of these records each year has continually indicated the importance of certain conditions as influencing the yield of peas.

Soils

Probably more important than all else is the question of good drainage and uniform soil conditions. Good drainage for peas probably means more than for any other crop, partially because they are started so early in the spring. At a time when the sub-soil and the drains are already liberally supplied with water, rains are more frequent and evaporation is slower. Uniformity of soil conditions is more important with peas than any other crop grown in this state because the peas are harvested all at one time, and if the quality is to be good they must be taken when the more advanced are ready. Having the soil in a high state of fertility either by use of a good rotation including a legume sod, or by

*The Gravity
which Pulls
Upward*

"Why does the ball come down when I throw it up, Daddy?" asks the little boy of his father.

"That's the law of gravity," is the pat answer given him . . .

Throw a ball up and it comes down. Drop a penny from your pocket and it hits the floor. This we all recognize as gravity at work—a law as changeless as time.

♦ ♦ ♦ ♦

Isaac Newton discovered the law of gravity which pulls things down, but all through the ages men and women have been discovering a law which pulls people up. We can pull ourselves upward . . . past our present level to greater heights. We can hitch on to a higher star.

♦ ♦ ♦ ♦

Lincoln discovered within himself that power which pulled him out of his log cabin into the Man of the Ages. Some people never discover the law that pulls up. But those who do, find that neither environment, nor poverty, nor lack of formal education, nor geography can keep them down.

♦ ♦ ♦ ♦

The Way Up is the same today as it has been for thousands of years . . . rugged and rough. The Way Up is only for those willing to pay the price.

The Way Up challenges us to defy the law of gravity and lift ourselves "by our bootstraps." The Way Up takes us from mediocrity to excellence, from scowls to smiles, from sorrow to joy.

The Way Up makes a man willing to run risks, choose adventure. It makes a dreamer a hard worker, a man of purpose.

It's the power within that makes each trial, each failure, each heartache a steppingstone to climb, climb, CLIMB. It makes Longfellow's verse a real part of us:

*"The heights of great men reached
and kept
Were not attained by sudden flight,
But they, while their companions slept,
Were toiling upward in the night."*

I'm dead sure that each one of us has within ourself the power to be much greater than we are. The important thing is to discover it and use it to **PULL UPWARD . . . always UPWARD.**

\$1,707,235,012.00

Swift & Company

You and we are both in the livestock-meat business

And we both know mighty well that big sales don't mean big earnings. There's a whale of a difference between gross and net. Here are some of the things which make that difference:

WE BOTH BUY RAW MATERIALS

There's your breeding stock and feeding stock . . . raw materials without which you can't do business. We, too, buy raw materials. Hogs, lambs, cattle and calves; dairy and poultry products; cottonseed, peanuts and soybeans. Our purchase of agricultural products takes by far the greatest part of the dollars we receive from sales.

WE BOTH BUY NECESSARY SUPPLIES

You've got to have fertilizer, seed, grass, hay and grain, a hundred and one things . . . The supplies we buy including salt, boxes, barrels, shipping cartons, thousands of items, cost another 4.5 cents per dollar of business done.

WE BOTH PAY WAGES

You pay your hired hands; veterinarian and other fees; costs of haying or other contracted jobs; the living costs of the members of your family who work on the place . . . Likewise wages and salaries take a big bite out of our sales dollar. We paid 75,000 employees \$237,519,974 last year . . . 17 times as much as paid to our 64,000 shareholders.

WE BOTH PAY TAXES

You pay real estate, property, income, excise and other taxes. We pay taxes too . . . in every state in the Union and in hundreds of counties and municipalities . . . Taxes must be deducted before we, or you, can show any net profit. Last year our taxes totaled \$31,042,994.

WE BOTH MEET TRANSPORTATION COSTS

There's gasoline for your car and truck; fuel for your tractor; tires, repairs. Transportation costs you money every time you make a pickup or deliver products to market. Last year transportation by rail and motor cost us \$50,078,225. That's part of the expense of moving food from where it is raised to where it's to be eaten.

WE BOTH CARRY INSURANCE, ETC.

You have lots of "incidental" expenses . . . telephone, electric light, heating, insurance policies, maybe some interest. Depreciation, too. We have all those, plus the cost of research to develop new by-product uses; of laboratories and test kitchens; of merchandising aids to help retailers sell more meat . . . You know how those incidentals add up! In 1949 ours added up to \$61,737,271—2.8 cents out of the average dollar of sales.

IF WE WORK HARD AND MANAGE WELL, WE BOTH MAKE SOME PROFIT

Some people don't know or don't stop to think about all those expenses. Seeing only the big figure of gross sales, they say, "What profitable businesses ranching, farming (and meat packing) are!" They don't stop to think that most of what comes in goes right out again. In our case about 99¢ of the dollar went out to other people or businesses . . . leaving us 1.2¢ as earnings, a total of \$25,826,129. Of this, the shareholders, who invested their savings in Swift & Company, received .6 of one cent as dividends.

1.2¢

AND, WE BOTH PLOW BACK SOMETHING INTO OUR BUSINESS

You can't afford to stand still. Neither can we. You re-invest part of your "profit" in new buildings, new machinery, etc., to keep your operation on a sound, efficient basis. We follow exactly the same prudent business practice. This year .6 of one cent is being retained in the business for future needs.

THIS IS OUR YEARLY REPORT to our friends—and business associates—on America's farms and ranches.

It tells you how much business Swift & Company did during 1949 . . . what we took in from the sale of our products . . . how much we paid out for our raw materials, and all the many costs of doing business . . . and what was left over to plow back into the business, and to pay to the 64,000 shareholders who own our company.

Swift operates in a large and highly competitive industry . . . an industry which provides a nationwide market for livestock, and supplies a nationwide demand for meat products, at a very low cost.

One pair of facts will probably interest you more than most others. Namely, out of each 1949 dollar that we took in from the sale of Swift products, we *paid out* just about 99 cents. And of that 99 cents paid out, 77.1 cents went to you farmers and ranchers in payment for the meat animals, poultry, eggs, cream, oil seeds and other agricultural products you sold us.

Wm. B. Traynor

We print this report to agricultural people because there is such a close interest between us. You and we deal together every working day of the year. You get a large part of your yearly income from what you sell to meat packers—Swift and others. And it's from you that we get the raw materials of our business.

Here are the main facts about our business during 1949.

Wm. B. Traynor
Vice President & Treasurer

Nutrition is our business — and yours

The Good and Bad Points of PEN STABLING

DAIRYMEN have long argued over the relative merits and demerits of the stanchion system versus the loose-housing system in dairy cattle management. Many of the arguments for and against the two systems could not be based on actual facts and figures. Comparative tests had not been made.

During and immediately following the war, dairymen, finding labor, feed, equipment, etc., much costlier than ever before, began requesting information on ways and means of lowering production costs and upping management efficiency.

In line with these requests the University of Wisconsin set up comparative tests to check the performance of a herd of dairy cows housed in an insulated stanchion barn with a herd housed in an open, cold, loose-run barn. A small milking parlor was used in conjunction with the loose housing system. The comparative results of the two herds during the past three years are shown in the following table. Most of the comparisons are on the basis of the conditions in the stanchion barn being 100 per cent.

	Stanchion Barn	Loose-run Barn
1. Temperature (29.04° F outside)	53.52° F	37.13° F
2. Humidity (72.95% outside)	82.02%	78.04%
3. Manure Pack Temperature—av. 3" from surface		84.33° F
4. Stall Barn Floor Temperature—average	57.7° F	
5. Labor Comparisons . . .		
A Actual summary of each time study	100.0%	82.0%
B Actual time for cleaning loose-run barn loafing area, mechanically	100.0%	83.7%
C Actual time for cleaning loose-run barn loafing area by hand	100.0%	91.9%
6. Feed Consumed (Cow-day basis)		
A Silage	100.0%	104.18%
B Hay	100.0%	103.65%
C Concentrates	100.0%	100.75%
D Total digestible nutrients	100.0%	102.83%
7. Bacterial Counts		
A Arithmetic average on pooled raw milk	5,724	8,364
B Arithmetic average—counts on pasteurized samples of pooled milk	177	135
8. Bedding (Cow-day basis)	100.0%	166.33%
9. Milk Production (4% fat basis)		
A On a total cow-day basis		
Pounds per day	29.42	31.32
Per cent fat	3.55	3.66
B On a milking cow basis		
Pounds per day	34.60	35.74
Per cent of stanchion barn record	100.0%	106.46
C Pounds nutrients per pound milk (4%) produced	100.0%	96.60%
D Cost per pound milk (4%) produced with conc. at \$60; hay at \$20; silage at 1/3 hay cost	100.0%	96.11%
10. Cow Weights—Av. gain per cow per test period	11 lbs.	34 lbs.
11. Calves		
A Gain per calf per day	100.0%	88.14%
B Lbs. nutrients consumed per lb. gain	100.0%	85.71%
C Lbs. bedding per calf day	100.0%	73.39%

Advantages of Loose-Run Barn

- Less humidity in barn.
- Less labor required to handle same number of cows.
- Feed consumption per cow was increased on both grain and roughages.
- Increase in milk production — both on a total cow-day basis and on a milking cow basis. Increase in production probably due to increase in feed consumption.
- Apparent increase in feed efficiency — took less pounds of feed to produce a pound of milk.
- Less feed cost per pound of milk produced.

Disadvantages of Loose-Run Barn

- Bacterial count on raw milk was higher. (New York data, however, shows that cleaner milk can be produced in a loose-housing setup.)
- Requires more bedding—actually an

advantage because the increase in amount of manure saved will have more value than cost of the increased amount of straw.

Other advantages of the loose-housing or loafing barns not shown in the table include: (1) general improvement in herd health—less udder injuries; less sore and swollen knees and hocks. (2) the building cost of a loafing barn is much less than that of conventional dairy barns—whether building a new barn or converting existing buildings, and (3) the loose-housing system is flexible. The number of cows can be increased without any great expense. It affords the greatest possible fire safety for the herd.

Adapting to the System

Here are some brief suggestions by the University of Wisconsin for dairymen who are interested in adapting their buildings for a loose-housing system. Such a system is usually thought of in terms of 4 separate units—the milking parlor, an open air barnyard, the feeding area, and the bedding area. On most farms the latter two are combined into one building called the loafing barn.

The loafing barn should be large enough to allow a minimum of 80-90 square feet per cow. Be sure the loafing area is extra large to allow for future herd expansions. Keep the ceilings at least 9 to 10 feet high to permit use of a power manure loader. Doorways should be at least 10 feet wide and conveniently placed to help aid in barn cleaning.

Keep the feeding area and the bedding area separated as much as possible to prevent excessive trampling of the bedded area. Hay, silage, and bedding should be conveniently located where it will be needed.

Use the open door policy between loafing barn and open barn lot. This will provide all the ventilation necessary and will likewise help lower the humidity of the barn.

The barn lot should be paved, at least the most-used portions. Allow 100 square feet per cow. For areas not paved, a well packed base of crushed stone or other material will be satisfactory. Drainage for this lot is important—a fall of one foot in 100 feet is adequate. Drainage should be away from the buildings. Where possible, it is best to have the barn lot protected from the north and west.

The milking parlor should be located as near the loafing barn as possible and on a well drained site. Use of an elevated stall arrangement will enable the operator to handle more cows in less time than the old conventional stanchion type parlor. It will eliminate stooping and squatting to put on milkers.

—A.A.—

CORN WITHOUT TASSELS

At the Mt. Carmel Experimental Farm in Connecticut this past year, visitors saw a field in which hybrid corn was grown without any detasseling. This was made possible by the development of corn which produces no pollen. This development could well revolutionize the production of hybrid corn and considerably lessen the cost of its production.

This new type of corn which produces no pollen is due to something which plant breeders call a "pollen sterile" characteristic. This characteristic was originally discovered in some corn growing in Texas; and while this variety was of little or no value, it was used in corn breeding until the "pollen sterile" factor was bred into varieties used in developing hybrids.

IF YOU MILK 10 COWS OR LESS...

The New De Laval Speedette Milker Will Save Time and Money For You, Too!

In every part of the country dairymen with herds of 10 cows or less are now milking better and faster and saving valuable time and labor with the new De Laval Speedette Milker.

The new De Laval Sterling Speedette Milker was designed for you—if you milk 10 cows or less. It is low in price, inexpensive to install, built for many years of low cost, trouble-free operation and top milking performance—the labor-saver, time-saver and profit-maker never before available to the small herd owner. Why put up with the drudgery of hand milking just because your herd is small? You don't have to do it. Call your De Laval Dealer today and ask to see the new Speedette.

FASTER MILKING

Henry Finke, Jr., Navasota, Texas, reports that with his new De Laval Speedette he milks 11 cows in 40 minutes. His wife and he, milking by hand, formerly required one hour and 30 minutes. Cows "took" to the Speedette at once.

"COWS MILK OUT FASTER"

Ira J. Savage, Langhorne, Pa., says: "Several of my heavy producing cows were slow with hand milking and now milk out much faster with my De Laval Speedette. It's a great time and labor saver for the smaller dairyman."

DE LAVAL SPEEDWAY FOOD FREEZERS

For better food preservation and better farm living. Improved table fare at lower cost. Beautiful in appearance—dependable and economical. Made in 8, 16½ and 35 cu. ft. sizes.

Where is Long Island Farming Headed?

THERE have been many changes in Long Island farming in the past few years. First, the growth of cities made much of the land so valuable that many had to figure higher-profit-per-acre crops. Then along came golden nematode to take thousands of Nassau County acres out of potato production. Then came price supports followed by acreage controls that now are becoming serious—especially to the man with small acreage and the man with huge machinery investment for large output. Long Island fruit and vegetable growers built up marvelously productive irrigated farms and then bumped into water problems and the five-day market week.

What is the most profitable use to make of land taken out of potato production? Will every farm eventually be irrigated? Will city growth increase assessment values to where taxes will be too high for ordinary farm activities? Or will it make the remaining farm land more valuable than ever for crops?

Below are the opinions of three men. We'd like to hear what other Long Island men think about the future of Long Island farming. Send your ideas to Jim Hall, *American Agriculturist*, Ithaca, N. Y. We will print letters as space permits.

Potato Grower

Everett C. Foster of Foster Brothers 200 acre potato farm at Sagaponack says:

"Many farmers are trying to find the answer to what use we shall make of land taken out of potato production. Perhaps as much as 5% of the land now used for potatoes should be taken out of potato production because it is not suited to that crop. There are a few crops that a farmer might substitute up to 2 or 3 acres, but there seems none that we can grow in large quantity.

"We do not produce milk enough for local consumption, especially in summer, so perhaps some farms should change over to dairying.

"Irrigation will increase some but not to more than 60% of the farms, and the increase will be especially slow if we have more government control on potatoes with a resulting decrease in income per farm.

"Because of high taxes, many farm crops are not profitable to raise here. This year most farmers will plant potatoes on their best land and soil-building crops on their surplus acres.

"Whether we have government controls or not, it will be several years before the potato grower will be able to consider that his business is on a sound basis. In this section we believe that this adjustment will come sooner if the government abandons all controls and subsidy payments."

Broiler Raiser

Edward G. Fry, who has a 24,000 capacity broiler farm on Phelps Lane near Babylon, has these ideas:

"Due to zoning restrictions, high taxes and land values, livestock is on its way out fast in Nassau County and, even in the Eastern end of the Island, only those who specialize with roadside stands and retail routes will be able to survive. In the past ten years a terrific amount of building has been going on and is still going on. With so many people coming to the Island, industry must come and I believe that

villages, recognizing this, are trying to make it attractive for industry to locate here. This means higher taxes and zoning restrictions and higher land values.

"These mean much more intensive farming, with the greatest efficiency and crops of high cash value. I also believe a new and improved localized marketing system must be set up along with advertising and processing organizations and plants. We on Long Island have the greatest market at our door but we must learn to use it to better advantage.

"The small man on the Island can only survive by retailing an intensively quality-grown product. The large producer must also strive for quality, top efficiency, and much greater proficiency in marketing.

"I do not believe irrigation will materially harm our water supply, because our soil is mainly sandy and much will seep back to the supply quickly. I believe in the next ten years the poultry industry (especially broilers) will increase considerably while other farming diminishes. We have the climate, soil, markets, and a few individuals and at least two feed companies interested and anxious to make this a little Del-Mar-Va.

"I believe Long Island holds a prosperous future for the efficient, intensive, and quality conscious farmers who are progressive and market conscious. The small farmer can only survive by retailing."

The Small Operator

Mr. Fry's statements might contain the answer to the opinion of one of the Island's real small operators, Frank Altamore, who is raising some poultry and vegetables on three acres at Huntington. The best bet, according to Frank, is "to sell out for building lots because the increase in future assessments and taxes will be too high for the ordinary farm to support."

What are your ideas on the future of Long Island farming?

—A. A. Staff Photo.

One of the busiest part-time farmers we've met in a long time is Earl E. Daniels of Dansville, Livingston County, N. Y. Earl is a regular mail carrier but finds time to care for 12 milk cows and, with his son, does a lot of tractor work for neighbors. Earl makes good use of both rye and sudan grass to round out a full pasture program for 12 cows on only 13 acres.

Meet America's Top Values

Meet Chevrolet's Most Powerful Trucks

They're tops. Tops in payloads, performance, popularity, and *low* price—that's what makes Chevrolet P.L. trucks America's top values. They're advance-designed to put them far ahead in features, and they are the most powerful Chevrolet trucks ever built!

On the farm, in the fields, on the highway—these P.L. trucks take the toughest loads, the roughest roads. They cost you less to buy, less to run, less to maintain. They are America's top values because in every way Chevrolet P.L. trucks are real leaders.

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

P.L.

ADVANCE-DESIGN TRUCKS

All these **PLus** features:

TWO GREAT VALVE-IN-HEAD ENGINES: the new 105-h.p. Load-Master and the improved 92-h.p. Thrift-Master—to give you greater power per gallon, lower cost per load • THE NEW POWER-JET CARBURETOR: smoother, quicker acceleration response • DIAPHRAGM SPRING CLUTCH for easy action engagement • SYNCHRO-MESH TRANSMISSIONS for fast, smooth shifting • HYPOID REAR AXLES—5 times more durable than spiral bevel type • DOUBLE-ARTICULATED BRAKES—for complete driver control • WIDE-BASE WHEELS for increased tire mileage • ADVANCE-DESIGN STYLING with the "Cab that Breathes" • BALL-TYPE STEERING for easier handling • UNIT-DESIGN BODIES—precision built.

Payload Leaders

Far Ahead with low operating costs per ton per mile. The rugged construction and all-around economy of Chevrolet P.L. trucks cut running and repair costs—let you deliver the goods with real reductions in cost per ton per mile.

Performance Leaders

Far Ahead on the hills or on the straightaway. The new Chevrolet P.L. trucks give you high pulling power over a wide range of usable road speeds—and on the straightaway, high acceleration to cut down total trip time.

Popularity Leaders

Far Ahead with more truck users by a choice of 2 to 1. Official truck registration figures for 1949 show Chevrolet trucks preferred over the next two makes combined—proof of the owner satisfaction they earn through the years.

Price Leaders

Far Ahead with the lowest prices in entire truck field. The Chevrolet truck line is the very lowest-priced line in the field—saves on initial cost. What's more, P.L. trucks give owners dollar and cents savings in maintenance and operation.

THE WAY TO SELL MORE MILK

is to tell More People About Milk

HERE'S PROOF!

We dairy farmers talk a lot, and worry a lot, about milk that is in excess of fluid requirements.

Production is rising steadily. Consumption is falling off. The problem looks unbeatable. But is it, really? Why can't we do what other business men do when they have a lot of goods to sell . . . just go out and work harder in order to sell more goods to more people.

The answer is that we can do just that. Farmers in other milksheds have been doing it for a long time. With higher prices than ours, and with fewer people to sell to, they have rolled up bigger sales increases, and have suffered smaller declines in consumption, than we have.

Connecticut Up 51%

Take the state of Connecticut, for example. For nearly 30 years, dairy farmers there have been plugging away, telling consumers how necessary milk is from a health standpoint, how much value it gives for the money spent, and how tasty milk products are in preparing meals. The result: Connecticut showed an increase of 51% in fluid milk consumption from 1940 to 1946, while New York showed only 27% and Boston only 31%. Since that time, Connecticut has dropped off only 2%, while New York has dropped 4% and Boston 6%, and prices to consumers have held better in Connecticut than in other markets. Moreover, Connecticut population has increased only 9% since 1940, while population in New York has increased 20%.

Pittsburgh Gained 47% and is Still Going Up

Twenty years of effort in Pittsburgh boosted fluid consumption 47% from 1940 to 1946, 4% from 1946 to 1948, and 6% from 1948 to date.

Southern New Jersey and Northern New Jersey both show comparable increases. So does New Bedford, Mass.

What Others Can Do, We Can Do

By drinking more milk ourselves . . . by encouraging friends and neighbors to use more milk for health's sake . . . and by contributing to advertising, sales and educational campaigns . . . we in the New York milkshed can boost the per capita ratio of fluid milk consumption. Because actually there's no excess of fluid milk, nor ever has been. There's only under-consumption. If everyone drank the milk that doctors and nutritionists say they should drink, we'd actually have a shortage.

At Cornell University, Dr. Clive McKay has conducted experiments which indicate that people in the last third of life need milk in their diets fully as much as teen-agers and infants. And that's an entirely new field for us to work on—millions of people who can be shown that they can extend their years of active, productive life by the simple drinking of milk. Of course, we can use and sell more milk if we set out to do it right now. Let's get going and keep it up until every customer is convinced.

Letters to the Editor

SECURITY?

I am very willing to pledge myself to the New Declaration of Independence which appeared in the December 3 issue. I want all the security my ancestors had when they landed here in 1609—their faith in God and in themselves.

The answer Mr. Kline gave Secretary Brannan should be placed in every paper in the country so that all may read and give thanks to God that there are still such men. We hear too much about the ones who are pulling down and not enough about the ones who are building up. Never has the country been in such danger as it is now—too many politicians who sell the country for votes for their parties.

—Madeleine N. Bradbury, East Orange, New Jersey.

— A.A. —

HOBBY PAYS

I have been intending to write you for some time. About a year ago Mrs. Elizabeth Townsend had an article in *American Agriculturist*, concerning my hobby of growing and selling African Violets. I have been wanting to tell you that I have received letters and calls at my home and I am still receiving them; last count over 300.

From the article I have shipped plants as far west as Wisconsin, up to Maine, and south to Maryland and Kentucky. I cannot do other work because of a heart condition, but I enjoy this and can take my time working at it.

I want to thank you, and I have also thanked Mrs. Townsend in person. I have always enjoyed your paper. My father has taken A.A. for many years.

— Dorothy L. Cornish, Trumansburg, New York.

— A.A. —

HUSKY CUCUMBER VINES

I read the story about Charlie's Potato; it is very good. I would like to tell you about the cucumbers I raised one year. I had moved to a new neighborhood and, come Spring, I started to spade my garden. Well, one of my neighbors comes and sez tain't no use plantin' this here garden as nothin' grows but weeds.

I sez where weeds grows, other things will grow too. Well, sir, after spadin' a good little portion I asks the wife where she wanted her cucumbers planted and she shows me. There was a piece of woodland across the road, so I goes over and gets me a bunch of dry brush and old tree tops and makes me a fire right on the garden. The next day I rakes the wood ashes in good and deep, then goes out to my wife's pappy's farm and gets me some good ole rotten hog manure. Then I started diggin' hills. I puts at least a good shovelfull of this manure to the hill, scratches some ground over it, and plants my cucumber seeds.

Well, sir, when them ther seeds come up, those vines grew so fast they wore the cucumbers out draggin' them over the ground!

—Albert F. Halbrock, Rockwood, Pa.

— A.A. —

NEARLY 200,000 LBS.

I have a cow that is 19 years old. I know nothing about her ancestry as I bought her when a calf up in the South Woods. She is a grade Holstein. For 16 fresh periods during her lifetime she has given around 192,720 pounds of milk testing 3.9.

I never feed too heavily on grain. I think over-feeding and too close confinement in the barn breaks down a cow. I let my cows out twice a day all winter.—Neil Cyrus, Potsdam, N. Y.

A Pennsylvania Farm: Modern in Home and Barn

ROBERT and Thelma Heitsman plan on comfort for themselves and for their animals on their Penn Heits Farm at Springville in Susquehanna County, Pennsylvania.

Robert's brother, George, had an idea for tie-in stalls that he thought would make his cows more comfortable and cleaner, and has been improving the idea since 1942. In the fall of 1948, Robert decided that the tie-in stalls were what he wanted and installed them in his barn. After more than a year's trial, he is very well satisfied. He told me that they were a definite help in avoiding injury, particularly udder trouble, which often causes mastitis. He says that Webb Bunnell of Montrose also has installed the new type stalls and claims that since installing them he has cut his mastitis injury to a minimum.

The new type stalls are built in the form of an inverted "V" which tilts eight inches towards the cow at the top, to hold her well back in the stall while standing. The inverted "V" spreads 30" at the bottom to give extra room while lying down and plenty of room to lunge ahead when getting up. The cows are tied with a 24" chain which is fastened just under the drinking cup attached to a vertical post beside the inverted "V."

Another innovation in Robert's barn is a 2x4" wooden strip on edge, run-

ning along the edge of the gutter at the rear of the stall. This holds the bedding in the stall and keeps the cows' udders warm and dry. The partitions between the stalls are of the familiar bowed tubular steel.

Robert says these tie stalls were put in with comparatively little expense. One of the big advantages of the stall

The Heitsman's modern kitchen

is the convenience in taking blood samples or giving medicine. In such cases, the tie chain can be slipped through the neck chain and dropped back to make a short tie. Bob told me, "Our veterinarian said he had less trouble taking my blood samples than he does in other dairy barns where they have stanchions or the 'boughten' tie stalls." He also says that the stalls contribute to more sanitary milk production by keeping cows cleaner.

In the Home

Many city women would envy the convenience and comfort of the Heitsman home. A picture of the Heitsmans' kitchen similar to the view above appeared in the Susquehanna County Farm and Home News over the following caption: "We're sick of city folks and even some appliance dealers who think farm families live in broken-down shacks with no modern conveniences. So we took this photo in Springville just to show them. Mrs. Robert Heitsman is the proud housewife, and as for modern conveniences, just look at that automatic washer, automatic dishwasher sink, electric range, radio on the wall, and fluorescent light in the ceiling. On the opposite wall are gleaming kitchen cabinets and the electric refrigerator. No wonder they have an easy chair handy in the kitchen! And, incidentally, the view from her picture window over the sink is something you'll never get in the city."

Mrs. Heitsman didn't stop with just modern equipment for her kitchen. Many professional interior decorators might envy her choice of kitchen colors. Half of the walls are painted soft velvet green and the rest are papered in an ivy pattern. The ceiling is light yellow and the curtains are white with red. Modern conveniences in their home include an ironer, which Mrs. Heitsman claims cuts the ironing time to one-third, and a new 30 cubic foot home food freezer in the cellar.

Since word got around that Robert has installed the new stalls, there have been a number of farmers dropping by to look them over and take measurements. They have all been impressed with the arrangement and several have voiced their intention of installing them in their own dairy barns. Mrs. Heitsman, too, is apt to have many more callers now that her kitchen has been publicized.—Jim Hall

ROBERT HEITSMAN of Springville, Penna., lists many advantages for the new type inverted "V" tie stalls in his barn.

New Cordwood Champion

McCULLOCH 3-25 POWER SAW

3 HORSEPOWER 25 POUNDS

You can turn any kind of tree or scrap lumber into cordwood in a hurry with the powerful, new light-weight McCulloch chain saw. On any farm with timber, the McCulloch will pay for itself quickly in time and labor saved. Beside cordwood, you'll save money making posts, felling and bucking logs for sale, tree maintenance, and rough construction sawing.

Here are some of the features that make the McCulloch 3-25 portable saw ideal for all-around farm use: weighs only 25 lbs., develops full 3 hp., automatic clutch, built-in chain oiler, kickproof rewind starter, and special McCulloch gasoline engine that permits sawing at full power in all angles and positions.

Most Flexible TILLAGE TOOL you've ever used

Model shown works 8' Also available in 12' width.

You can quickly detach the packers . . . use harrow or packers separately . . . trail both packers BEHIND or AHEAD of the harrow.

Harrow adjusts itself to turns. Teeth keep working. Packer discs follow in the same track. No skidding or wobbling, ever on sharp turns.

Five tools for the price of one! You can use this new Le Roy combination tool *five different ways* to get the right tith in any soil, for any crop. Harrow and packers can be used alone, or assembled quickly three different ways. As shown above, it breaks clods, then harrows, then packs and firms the soil. Harrow teeth are adjustable . . . can be spaced exactly as you want them. Harrow is hinged, not rigid . . . hugs uneven ground and works every square foot. Harrow and packers stay in line and *till thoroughly* even on sharp turns. Four portable sections . . . can be stored away quickly, by hand, in 4 x 8' or 4 x 12' space. See it at your dealer's now.

GARDNER SEED CO., Inc., Rochester 3, N. Y.

What Do YOU Think?

By JIM HALL

IS A HOME GARDEN WORTH WHILE?

TEN PEOPLE sit down at the Alfred S. Despres' table three times a day. The garden at this East Jaffrey, New Hampshire, dairy and poultry farm is mighty important.

Mr. Despres and the children do the work to keep the family supplied with all the fresh vegetables and fruit in the summer, and Mrs. Despres' list of what she canned last summer sounds like a supermarket inventory. I'd like to know if anyone who reads this puts up more. Here's her list, all in quarts: 105 sweet corn, 120 tomatoes, 120 tomato juice, 75 apple sauce, 60 beets, 60 carrots, 80 of various pickles, 30 blueberries, 30 blackberries, 20 raspberries, 20 peaches, 20 pears, 10 plums, and some jams and jellies!

In addition to these 750 quarts of vegetables and fruits and the jam and jelly supply, the Despres bought their first home freezer late in the summer, in which they froze most of their meat supply and experimented with some fruits and vegetables!

Now that's a garden that is a garden, but there are folks with small families who tell me it is cheaper to buy produce than to raise it but . . . they still raise a garden! For instance, Otto R. Farnham of Horseheads, Chemung County, New York, says: "Plowing, fitting and seeding a garden is the least trouble of all. It is actually fun to plan and plant a garden, and there always seems to be time to do a good job of it, too, but—the weeds, bugs, blight and dry weather have never failed to take over our garden in mid-summer, when my wife, our 8-year-old son, and I are too busy with other work."

"So, I don't think it pays for a small family to have a garden but we'll probably plant one just the same this year!"

George E. Huften of Colebrook, Connecticut, says, "On a small scale it's cheaper to buy, but you can't get the quality. For instance, corn cannot be put in the freezer quick enough when you buy it."

Who Does the Work?

Some interesting slants on how much garden work the housewife should do come from Mrs. Burton Banks of Panther, Pike County, Penna. She says that if time counts, it's cheaper to buy the produce. However, when Mr. Banks was alive and they were raising a family of four, they grew most of their vegetables. Now she no longer attempts to raise large amounts for canning but manages to grow plenty for summer consumption "as fresh picked vegetables are so good!"

Mrs. Banks said, "I am country raised myself. I believe many farmers who have married inexperienced girls will find it will pay better not to add the care of a large garden to her other new duties unless she insists. It will not often pay a good dairyman to neglect other crops and his herd for the slight saving his garden might yield."

Mr. and Mrs. C. Marsden Bacon of Middletown, Conn., both gave me their ideas on the home garden. Mr. Bacon said: "A farm operation is not complete without a garden. Its cost cannot be figured on a 75c an hour minimum wage basis but rather on its value in use throughout the year. There

is no surplus or waste, as total production is consumed by daily needs when fresh picked, or later through the process of freezing. Our garden is a 365-day operation—strawberry shortcake at Christmas and corn on the cob in February."

Mrs. Bacon agreed and then added: "Our garden, in conjunction with a dairy and poultry farm, gives our family delicious, well balanced meals the year round. It means hard work on hot summer days and on many evenings after the regular farm work is done, fighting drought, disease and bugs, but even then we think it worth while. The advantages cannot be figured in dollars and cents. We do not have to buy drug store vitamins!"

James P. Welch of Troy, Rensselaer County, N. Y., agrees that there's better quality in fresh picked produce and contends that "it's worthwhile financially as well when you have the land, equipment and fertilizer readily available on a dairy farm." The Welchs will grow a larger percentage of their food when they get a freezer, and it's lack of a freezer that keeps them from raising their own meat. Last summer was the first Mrs. Welch ever spent on a farm. She thinks it's wonderful to pick vegetables as needed from their own garden from early spring until December.

Uses Farm Equipment

Most people, like Mr. and Mrs. Robert T. Howard of Edmeston in Otsego County, N. Y., think it's cheaper to grow your own vegetables, especially when you can or freeze your winter supply. To get real value, they recommend: "Plant it in rows so that you can cultivate with a tractor to take the backache out of a large garden." Mr. Howard fertilizes, fits and marks the rows, then the whole family gets to work planting it. "For the time spent," says Mrs. Howard, "we get a great deal of enjoyment and good eating at low cost."

"A person doesn't know the true flavor of fruit and vegetables unless he can get them right from the tree or garden," says L. G. Huntington of Henniker, New Hampshire. And from Francis R. Wells of Cummington,

MONROE FARMS, BOX 555, Browns Mills, N. J.

(Continued from Opposite Page)

Mass., comes advice to lay out a garden to make the most use of a tractor or team. He's all for a garden but told us: "A busy farmer should not have strawberries, raspberries or asparagus, as they are all great time consumers." (Methinks many are going to disagree with that last statement of Mr. Wells'. For instance, I think Editor Ed Eastman would rather give up his cattle than the berries he puts in his freezer every summer!)

Arley Day of Forksville, Sullivan County, Pennsylvania, "just wouldn't be without a good garden on a farm." Mr. and Mrs. David Schreiber of Southbury, Conn., "wouldn't can or freeze any vegetables if we had to buy them, because it's the garden freshness we like." Among others who told me that a home garden is worth while, and who grow anywhere from 75% to 90% of all their own vegetables, are: Philip Dater of Cummington, Mass.; Casper P. Zimmerman of Bernardston, R. D., Leyden, Mass.; Martin Jewert, Chaffee, Erie County, N. Y., and C. K. Meade of Auburn, Maine.

Our readers have proved to me that a home garden is very much worthwhile. What do You think?

— A. A. —

FIGURING PLANT FOOD

Before deciding how much manure and fertilizer to add to the home garden, take a few minutes to pace it off and find out how many square feet you have in it. A quarter of an acre (about 10,000 sq. ft.) is about right for a family of five.

For every 100 sq. ft. in the garden, plan on 150 to 200 pounds of manure if you have it, or 5 to 8 pounds of commercial fertilizer. If you can afford both, it won't do the garden a bit of harm.

Where you are side-dressing vegetable rows, after they come up use 1 pound of fertilizer for each 50 feet of row.

— A. A. —

EXTRA FERTILIZER FOR TOMATOES

Early yields of cannery tomatoes were improved in recent tests when only part of the nitrogen was applied before planting and the rest put on as a sidedressing as needed. This avoids the delay in yield that commonly results when all the nitrogen is applied before the plants are set. The best time for sidedressing tomatoes, according to Professor C. B. Sayre of Geneva, New York, is at the last cultivation. The experiment showed that 200 to 300 pounds of nitrate of soda to the acre or equivalent amounts of nitrogen from other sources was the best rate of sidedressing.

— A. A. —

SPRING BERRY PRUNING

Your blackberries, black caps and purple raspberries will produce better if you pinch out the tips of the new canes early in April before they get too tall. It is not satisfactory to cut the canes back after they are six or eight feet long.

But DO NOT pinch back the canes of red raspberries. It will only encourage the growth of many weak canes.

— A. A. —

GIVE MELONS ROOM

You would be amazed if you could see the entire root system of one cantaloupe plant grown in fertile soil. Doubtless you would conclude that with such a root system, one plant per hill, rather than three or four, is enough. You would be right.

Melons take a lot of garden room but they give plenty of satisfaction if you can grow them successfully. You will need a warm, fertile, friable soil, plenty of room for the plants to grow, and good weed control.

Only **NATURAL** CHILEAN NITRATE offers you all these **10 Vital Advantages**

1. **Natural.** Chilean Nitrate is the only natural nitrate in the world.
2. **Nitrate Nitrogen.** The nitrogen is 100 per cent nitrate.
3. **Sodium.** Chilean Nitrate contains sodium equivalent to about 35% sodium oxide (Na₂O). This acts like potash (K₂O) and helps to make the phosphate in the soil more available.
4. **Iodine.** Chilean Nitrate contains iodine to help meet the needs of plants, animals, and human beings.
5. **Other Plant Food Elements.** Chilean Nitrate contains small quantities of other elements that contribute to strong, healthy plant growth, such as manganese, potassium, magnesium, boron, calcium, iron, sulphur, copper and zinc.
6. **Ideal Condition.** Chilean Nitrate

comes in free-flowing pellets — easy to handle and to apply in any distributor.

7. **Quick Acting.** Chilean Nitrate is immediately and completely available.
8. **Anti-Acid.** Chilean Nitrate helps keep the soil sweet.
9. **Time-Tested.** Chilean Nitrate has been proved by more than 100 years of research and practical farm experience.
10. **Doubly Profitable — Economical.** Chilean Nitrate improves the quality of crops as well as the yield. Consistently excellent effects of heavy applications year after year upon crop and soil alike make it an outstandingly profitable, economical nitrate.

Question Box

Last year my red raspberries were crumbly when picked. Was it due to the dry weather?

This condition is the result of a disease called mosaic. You cannot spray or dust for it. The remedy is to dig out the old patch and buy disease-free plants from a reliable nursery. Some varieties are more resistant to mosaic than others.

What fertilizer should I use on my bearing strawberry bed this spring?

Don't use any! It will encourage leaf growth at the expense of your berry crop. The time to use fertilizer and manure is in the spring of the year in which the plants are set out.

Does it pay to renew an old strawberry bed?

Personally, I doubt it, especially if it is weedy or grassy. I have always found that it is less work to set a new bed. If you don't have room to have a new bed each year, thin the old one drastically and hold it over. — H.L.C.

Are Baldwins a good variety to cross-pollinate other apples?

No! Good pollenizers among the common varieties are McIntosh, Northern Spy and Cortland. Poor pollenizers include Baldwin, Rhode Island Greening, Gravenstein and Tompkins County King.

For a young dairyman with limited capital, would you advise buying a proven sire or a relatively young bull?

Many factors are involved, including the level of production in your herd. It takes a better bull to maintain or increase production in an excellent herd than it does in an average herd.

Remember also that a bull can be proven, yet the figures may not be particularly impressive. If they are impressive, the price is likely to be high. These days, information is available whereby young sires can be picked with very good success. The way to pick a young bull is to study the records of his close relatives and, in fact, the entire family. Personally we would rather buy a young bull with excellent production back of him than to get a mediocre proven bull.

Don't forget that in some cases the most effective way of building up your herd is to join an artificial breeding association.

In putting in tile drain I understand there is a relation between the depth of the drain and the distance apart of the laterals.

This depends to some extent on the kind of soil. A line of tile at any given depth will drain a greater width of sandy or gravelly soil than it will of clay. However, where drains are only 2 feet deep, the laterals should not be over 32 feet apart, while tile from 30 to 40 inches deep can have laterals from 40 to 60 feet apart.

When and how should I fertilize raspberries?

Put on six pounds of nitrate of soda, sulfate of ammonia or other nitrogen carrier per 100 feet of row. Apply it early in the spring before the new canes start.

Where legumes have been grown successfully on a farm for many years, is it necessary to inoculate when seeding?

The cost is so small that it is considered good practice. Experimental results usually show a yield increase following inoculation, even though the legume previously grew on the field.

— A.A. —

Wool blankets should not be washed more often than necessary, for wet wool is sensitive to strain, rubbing and excessive heat.

KLEEN-EZEY AMERICA'S FOUR-most Cleaner-sanitizer!

1. MOST effective in securing low-count milk — 99.9999+ % bacteria kill.

It's Handy

USEFUL "GLUE KINK"

My eyes opened wide not long ago when I saw a workman doing a glue job in a different way. He was applying glue without the usual brush. He squirted the glue out of an ordinary oil can.

"Why do you do it that way?" I asked. The man answered, "I can place the glue exactly where I want it, in small or large doses, in grooves, in deep holes, and in spots that are not get-at-able with the ordinary brush. It is easier to do a job in this way and a better job results, particularly when I want to place the glue on

the bottom of a groove or hole without touching the sides on the way down. The can of glue should be kept warm at all times. I do this by placing the can in warm water while it is not being used, just like this"—and he showed me his pot of warm water that he used for keeping the glue warm.

Of course, there is nothing better than a brush for applying glue to large surfaces and to areas that are easily reached.—*W. F. Schaphorst, Newark, N. J.*

—A.A.—

BOLT ANCHOR

To anchor a bolt in stone or concrete, drill a hole deep enough to take the bolt, then split the bolt with a hacksaw. Make an iron wedge for the

split in the bolt and then drive the bolt with the wedge started in the split, into the hole and it will stay.—*Leroy F. Bailey, South Ryegate, Vt.*

—A.A.—

CATCHING RATS

To catch the wisest house rat, or any rat, take a newspaper and tear it into small bits the size of a nickel and sprinkle all the entrances to rat holes that you can locate. Then set traps in a few holes and cover them with bits of paper. By doing this I'm sure you will have your place free of rats, as the paper confuses the rats so that they cannot locate your traps and they get caught the first time out. This system will work in any building.

—*Kenneth Gabrosek, Fly Creek, N. Y.*

—A.A.—

WARM FEET

I have four children of pre-school age who love to play in the snow. I found that their feet got cold so quickly that they couldn't stay outside very long at a time. This year I bought their overshoes and boots two sizes larger than their shoes, and put a pair of skating (woolen) socks over their shoes before I put on their overshoes. Now they stay out much longer before their feet get cold.—*Mrs. William Beebe, Taberton, N. Y.*

—A.A.—

When choosing a design for a hooked rug, remember to use shades of no more than three colors and to emphasize one color more than the others.

CRAINE-NATCO TILE Your Best Investment

If you value permanent, trouble-free service, you'll find a Craine-Natco tile block silo the best buy you ever made.

Each tile unit contains the maximum number of air cells, for better insulation. They're unharmed by silage acids . . . glazed for a striking beauty that lasts! You'll get more for your silo dollar, in a Natco.

Craine, Inc., 210 Pine St., Norwich, N.Y.

acres of Good living

PLANT AND CULTIVATE UP TO
6 ROWS
AT A TIME WITH
Rear Engine Power

The farm idea of the year is knocking at your door. Acres of good living and high cash returns can be yours with multiple-row beans and vegetables, as well as fruits, berries, melons, row-cultivated field seeds, or legumes, replacing crops cut by acreage allotments.

Now you can plant and cultivate many of these high-pay crops up to 6 rows at a time . . . riding in an easy seat . . . with the rear-engine Model G and front-mounted tools.

The thrifty Model G is more than an ideal helper tractor for planting and growing regular field crops. It gives you straight-ahead vision and a special 3/4 m.p.h. creeper gear for cultivating inch-high seedlings in close rows. You can vary wheel spacing from 36 inches to 64 inches and adjust quick interchanging tools for any row width.

Multiple-row crops can prove to be acres of gold in 1950. Take a look at their possibilities from the front-view seat of the Model G Tractor.

THE WHY of model G design

HIGH-ARCH open frame gives complete vision and high clearance for easily-attached, strong, free-action implements.

TRACTION is boosted by engine weight over rear wheels. Permits use of 6-inch tire necessary for multiple-row cultivation.

BABCOCK'S

HEALTHY CHICKS MAKE GREAT LAYERS

High All-Time Pen, Championship Class at California Test. Net Profit \$8.10 per bird over feed cost.

In (1948-49) official laying tests our White Leghorns won as follows:

1. High White Leghorn Pen all tests.
2. High Pen all breeds in profit class at California.
3. High Leghorn Pen at Western New York and Georgia.
4. High Four Pens all breeds at Pennsylvania.

Our White Leghorns still hold the All-Time World Record for one pen.

We Hatch the Year 'Round

We hatch White Leghorns, Red-Rock Cross, Rhode Island Reds, and Barred Rocks all year . . . own two hat heries, with 530,000 egg capacity—three poultry farms and 15,000 breeders. We also carry on a complete pedigree-progeny testing program.

Send for Free Catalog

Write for our 36-page illustrated catalog describing our breeding program.

At left is a cut of the Poultry Tribune Trophy which we won for the first time last year. We had twelve pens of White Leghorns entered in Official Tests for 1948-49 and they averaged 273.50 eggs and 287.90 points—a new high record set for the trophy.

Here is an 80' x 70' dairy barn we remodeled into a 5,500-hen laying house. Works very well. Pond in foreground is 9' deep, stocked with blue gills and bass.

These two houses on our Number Three Farm hold 9,000 layers in all; we do most of our trap-nesting in these houses.

This is Harrison Fagan, who works on our breeding, about to remove pedigree chicks from tray for wingbanding. We wingband over 40,000 chicks each spring. We hatch over 2,000,000 commercial chicks per year. All of our White Leghorns and Barred Rocks are exactly the same breeding as our pedigree and contest pens.

WHAT TO DO WHEN THE CHICKS ARRIVE

(Continued from Page 1)

the first three or four days. You have to be careful, though, because with coal or oil brooders you might get them too warm to the point where the chicks are over-heated and can't get far enough away from the stove to get cooled off.

Some poultrymen lose chicks under electric brooders because they do not keep them warm enough. You will have better luck with an electric brooder if you will take the thermometer outdoors and throw it over your right shoulder just as hard as you can. Then proceed to brood the chicks according to how they act and without a thermometer. More chicks are lost under electric brooders because people brood by the thermometer and not by the action of the chicks than for any other reason I can think of. If you are using a thermometer, you may have to get the temperature up to 120 degrees F. to get the floor of an electric brooder warm enough to let the chicks thaw out.

What you should do with an electric brooder is put the chicks under it after it seems to be real warm and keep increasing the heat until the chicks start to spread out. You can tell when the heat under an electric brooder is just right by getting down on your knees and looking under. If half of the chicks are sitting down on their stomachs and either sleeping or just sitting there, and if the other half are standing up and walking around or eating, the temperature is just right.

Must See to Eat

You should have some type of light under the electric brooder so that chicks can see to eat. Chicks should be fed under electric brooders and watered under electric brooders the first few days because in cold weather it is too cold out from under the brooder for them to venture out and eat. They have just got to be fed and watered under the brooder the first few days when the weather is cold or when the brooder is used in an unheated house.

After four or five days you can gradually move your feeders and fountains out into the pen and the chicks will run back and forth from the brooder to the feeders, and they will stay out from under the brooder longer and longer as they grow older and their natural blood heat comes up without the need of artificial heat.

Be sure that your coop is absolutely rat-tight and be sure you didn't fasten any rats in the house when you prepared it for the chicks. One rat can kill one hundred fifty chicks in a night and even haul them all away and hide them.

The biggest secret to learn with chicks is to look at the chicks and judge whether they are too hot or too cold. Just as soon as you learn that very, very simple thing, you will be all right. You would be surprised to learn how many people fail to look at the chicks, see whether or not they are comfortable, and act accordingly.

Good luck!

* * *

GETTING CHICKS THAT ARE FREE OF PULLORUM

By OLIVER HUBBARD

TWENTY-FIVE years ago it was difficult to find many sources of chicks in the Northeast that could be guaranteed to be free from pullorum. Today, there are very few hatcheries, and practically no breeders, producing chicks from flocks that are not under the pullorum control phase of the National Poultry Improvement Plan.

There has been some criticism of this National Poultry Improvement Plan and some of it is deserved. There, however, has not been any criticism in regard to standardizing on the various stages of pullorum control. It does

ANALYZING THE APPLE OUTLOOK

(Continued from Page 6)
neighborhood which swelled the crop several years ago that will produce no more. There are others which cannot be expected to pay and might better be removed.

How does this affect the orchardist who is located so as rarely to lose a crop by frost or drought and who is able to control insects and pests reasonably well?

Experience has shown that such orchards when well-managed have been profitable in years of average or less-than-average national crops. They are needed in the economic scheme of things. They are likely to pay more often if the many unfavorable orchards are eliminated, so that bumper crops may be less unwieldy.

There has been an ideal of securing the highest production per acre, even at the cost of quality. Consumers are much more choosy of the fruit they buy than formerly. They have a greater choice of competing fruits. It would seem to be smart to aim for desired sizes and quality, even with lower yields, and to diversify so that some income from other sources can carry the overhead in years when all sections bear and prices are low.

— A.A. —
AN \$86 MILLION "SIDELINE"

(Continued from Page 9)
Perhaps in first place among reasons for farmers getting out their own lumber and wood as a cash crop is the chain saw—a product of years of engineering research that now makes it possible for one man to average, for example, 15 to 20 cords of pulp a day.

The chain saw isn't a new invention—in fact, the first U. S. chain saw was patented in 1858—but it wasn't until this century that any were available commercially. The industry then went through a period designing hand-cranked saws, electrically powered saws and finally, in the early 1930's, the gas engine powered portable saw.

The war and new lightweight engines led to modern chain saws such as those illustrated on page 9. Now between 20 and 30 manufacturers are turning out close to 100 different models and sizes. It's safe to say that there are now models for practically any woodlot need. One-man 3-to-5-horse-power saws from 14 to 36 inches long are on the market, and one 3 h.p. 18-inch saw weighs less than 25 pounds! Many manufacturers provide helper-handles to convert these saws to two-man use, and there are regular two-man portable outfits with up to 12 h.p. engines to power saws 7 feet and more in length—long enough to fell even the biggest trees in the northeastern forests.

Most manufacturers have designed their power units so that chains of various lengths may be used, and several offer a unit that can be used as either a chain saw or bow saw by merely changing attachments.

Each model has its own features to appeal to users, and we suggest to those who contemplate the purchase of chain saws that they check the work they are going to require of their saw and then get one to meet those requirements. There is no need of buying one bigger than you'll ever need, but be sure the one you get is large enough and powerful enough to do the kind of work you want.

Perhaps the whine of gas engines has taken some of the romance out of lumbering operations but not even Paul Bunyan could claim for his big axe half the production of these modern saws that are helping bring millions of dollars to Northeast farmers and helping to fulfill a nation's requirements of lumber, pulpwood and fuel.

**BEACON
COMPLETE
STARTER**

**FASTER CHICK GROWTH...FEATHERS TOO
....on 'LESS feed!**

Chicks tend to grow fast in the first few weeks—and Beacon Complete Starter is formulated to help encourage this growth.

Beacon's 25% protein, low fibre and high biological efficiency means economy and fast growth! Helps develop excellent feathering, too—even in hot weather.

LET'S LOOK AT THE RECORD!

Records show that birds of many Beacon users average well below 3 pounds of feed per pound of meat at weights of 4 pounds and over, per bird, at 9 to 12 weeks of age. More—there'll be fewer "barebacks." Feather pulling and cannibalism—so frequently seen with higher corn base rations—are discouraged.

AFTER BEACON STARTER

After Beacon Starter has produced its fine results—keep up the good work! For BROILERS switch to Beacon Broiler Feed at 6 weeks. For LAYERS add grain at 7 weeks—switch to Beacon 70/30 Feeding Plan after 12th week.

SEX-LINKED HALLCROSS PULLETS RIGHT NOW!

Yes sir! It's *always* smart business to buy QUALITY chicks and Hall Brothers' Sex-Linked Hallcross pullets are proven QUALITY chicks with a record of performance that's hard to match. MORE EGGS from the same amount of feed and labor are always a good deal, but right now Sex-Link Hallcross "bonus" eggs are the best kind of profit insurance against fluctuating prices.

Consider the records that SEX-LINKED HALLCROSS pullets have rung up. High all-time pen and individual egg production records for all cross-breeds . . . an average of 16 eggs per bird more than all the other standard test birds entered at Maine 1944-45. Consistently high records like these prove you can depend on Sex-Linked Hallcross for more eggs per bird and explain why we say "It's smart business to order Sex-Linked Hallcross pullets."

OR ORDER BARRED HALLCROSS . . .

The great dual-purpose producers!

If you want both high egg production and heavy meat production, you can't beat BARRED HALLCROSS! Heavy-meated profitable broilers, yet at the same time, prolific layers of large-sized eggs.

We hatch chicks from 6 PURE-BREEDS and 4 HALLCROSS . . . all top quality chicks. Write today for catalog or see your Hall dealer for prices and delivery dates.

HALL BROTHERS HATCHERY, INC. Box 59, Wallingford, Conn.

GETTING CHICKS THAT ARE FREE OF PULLORUM

(Continued from Page 22)

make possible an efficient, uniform method of designating the degree of freedom from pullorum of every hatchery and flock that is cooperating with their State Breed Improvement Association under the National Poultry Improvement Plan.

There are four grades under which a flock, or a hatchery, can qualify as to the pullorum rating in a National Poultry Improvement Plan. These are: U. S. Pullorum Tested; U. S. Pullorum Controlled; U. S. Pullorum Passed, and U. S. Pullorum Clean. The U. S. Pullorum Tested and U. S. Pullorum Controlled stages do allow some tolerance of reactors in the flocks which are tested. The U. S. Pullorum Passed and U. S. Pullorum Clean grades do not allow any such tolerance and must pass an official test with no reactors being found.

A U. S. Pullorum Passed or U. S. Pullorum Clean hatchery is one which hatches only eggs that come from breeding flocks of the above pullorum grades.

Today, all that a poultryman needs to do to be sure of getting chicks free of pullorum is to buy from a U. S. Pullorum Passed or a U. S. Pullorum Clean hatchery. Each State Department of Agriculture does publish a list giving the pullorum status of hatcheries and breeding flocks that are entered in the National Poultry Improvement Plan. These lists are available to anyone who requests them. It is easy for a buyer to check up on any producer of chicks and to buy with confidence from those who do have pullorum ratings that signify that their breeding flocks are absolutely free of this disease.

— A. A. —

EXPANSION OR CONTRACTION?

By ANDREW CHRISTIE, President, International Baby Chick Association

IF future events cast their shadows before them, one would be inclined today to be extremely "bearish" about the condition of the poultry industry in 1950. Therefore, the immediate reaction to any question of expansion would be to suggest a "wait-see" attitude, and to urge poultrymen to continue their operations on a year-to-year basis.

However, the case of each poultryman must rest on his own merits. Despite the current drop in the prices of poultry and eggs, there is always a market for producers of strictly fresh, high quality eggs and broilers, fryers, roasters, and turkeys of known value. Where such reputation exists, one can expand, with limitations, in anticipation of consumer demands in nearby markets.

Despite an anticipated decline in agricultural income in 1950, the overall disposable net income of the consumer

Roostless Hen Houses

WE HAVE been observing houses without roosts for some years and it was only recently that we were convinced that they are workable and began to talk about them. It really is only another step from the way we handle broilers, roasters and capons to the carrying of layers through the winter without roosts.

There are some objectionable features to leaving the roosts out of the house. The birds want to roost on the feeders to some extent and on the perches to the nest. If they use the same area in the poultry house for roosting every night, there may be some tendency for the litter in that area to be a little more troublesome. There are advantages, however, which I think tend to offset these. Now, there is considerable expense in installing roosts of any kind in a house. There is also the expense of repairing them because the wire commonly used has a great tendency to rust out. We are sure that we have better breast bones on the pullets when they do not have roosts.

If there is a tendency for birds to want to roost immediately after they are housed, I'm sure that it is no more troublesome to take them off the entrances to the nest and the feeders than it is to teach a flock of pullets to roost. We always have that trouble with a great many of the broods of heavy breeds which we house. We find that we can overcome these difficulties to a considerable extent by closing the entrances to the nest at night, by using feeders without perches and by the use of all-night lights. Dampness in the litter can be overcome by the use of lime and by stirring of the litter.

Question About Leghorns

We have had no observations with Leghorns because we have very few of them in the state. From what I know of these birds, I suspect that they would give a considerable amount of trouble, and if I were a poultryman I would want to try this out on a very small scale before attempting it in a larger way.

There are a number of poultrymen in New England who have tried this plan and I think the reports are generally favorable. I know of a number of new houses that are under construction now and I'm told that many of them will not have roosts. These poultrymen have done considerable investigating and they find that there is plenty of evidence substantiating our observations that roosts do not appear to be necessary.—G. T. Klein, Massachusetts College of Agriculture.

—A.A.—

KEEPING DRAINS OPEN

DID you ever have trouble with a plugged up drain in your poultry house? Many people do. Recently I discovered that on the farm of the department of poultry husbandry at Cornell they have worked out a simple scheme that puts an end to most of that sort of trouble. Dr. J. H. Bruckner, head of the department, said that before they put in homemade catch basins, they had had to abandon some drains because they couldn't get them opened up. Now they almost never have any drain trouble.

Somewhere along the line, inside the house or just outside, a break is made in the drain and a concrete box is built which acts as a settling or catch basin. Of course the floor of the basin must be below the point where the drain empties in, also below the exit, and the top should be at ground or floor level with a snug-fitting cover that can be removed for cleaning out the accumulated feed and litter from time to time. No particular size or shape has been adopted as standard. They are built to suit the location.—L.E.W.

There are no finer baby chicks than SUNNYBROOK— regardless of price!

SUNNYBROOK Baby Chicks have everything — Robust Health — Quick Growth — Top meat quality and heavy egg production. They are bred from the best production strains in America. Why Electric Brooders are best!

THEY give your chicks the right start in life. Help them feather more quickly and be ready for outside range earlier. The electric brooder controls its temperature automatically—will not overheat the brooder house on warm days nor blow out in windy weather. And you'll save labor because there's no fuel to be carried to the brooder nor ashes to carry away.

Our farm representatives will be glad to give you further information on electric brooding and on the right kind of wiring for brooder operation.

(Continued from Page 24)

will probably not vary greatly from that of last year. This bright side of the picture gives rise to the possibility of a relatively stable market for high quality poultry and eggs.

There is also the probability that there will be fewer poultrymen and farmers this year. Consequently, production figures will dip proportionately. In addition, there is reason to believe that the currently unattractive market will discourage many midwestern grain producers from starting chicks and hogs this season. This may free much wheat and grain to normal channels of distribution, and bring about an equitable relationship between the price of feed and that of poultry products. However, one must bear in mind that the poultry industry is going through a definite transition today, and that any expansion must be done on the most prudent and conservative basis.

FIRST FEED AND WATER

By JOHN V. B. RICE

I THINK it is definitely a good practice to feed and water baby chicks upon their arrival. Of course by this I mean they should be fed as soon as they are taken from the boxes and placed around the brooder stove or under it. Very often chicks are shipped long distances or possibly are delayed on the road and in that event they arrive in a hungry condition. If we observe what happens under natural conditions we will notice that as soon as the chick is hatched and is strong enough to walk around, it will start picking up little bits of this and that in the neighborhood of the coop.

I have never seen evidence that chicks would eat too much feed or drink too much water, even when fed and watered at an early age. On the contrary, if they are not given feed and water they are bound to pick up litter and in many instances will become crop bound, and they will either die or become stunted.

I believe the practice of confining chicks to the immediate vicinity of a brooder stove or electric brooder and placing newspapers on the litter for the first several days is good insurance against the chicks picking up a lot of foreign material. This is a very grave danger and I have a feeling that many hundreds of chicks are lost each year because of carelessness in the first few days of brooding.

— A. A. —

INSULATING MATERIAL FOR HEN HOUSE

Do you think wood shavings would make satisfactory insulation for a poultry house? Also, what type ventilating system would you use in a poultry house 40' x 25'?

Wood shavings make a very satisfactory insulation for a poultry house. Many people have used them and they are recommended by the house construction people. Like everything else, they do have their limitations. I am told that they tend to pack down after they have been in the wall a while and that, if possible, it would be well to leave a board or two at the top so that they can be removed to refill with fresh shavings later on. Also, if rats get into the base where the shavings are, shavings make a very excellent home for rats.

In trying to reduce the danger of such places becoming rat infested, it has been recommended that lime be mixed with the shavings when they are put into the wall. The usual amount is about one pound for every bushel of shavings.

As for ventilating a poultry house, I think that knowing what we do today of the new type of fans and motors to drive ventilating fans, I would by all means recommend the fan ventilation system.—L. E. Weaver.

Brooks Appliance Co., 201-F State St., Marshall, Mich.

From left: Harold Metzner, 1949 champion in the DeKalb New York Corn Growing Contest, shows the trophy and chest of silver he was presented for producing 144.09 bushels of corn to the acre. Next to him are C. M. and R. L. Conklin of Locke, second place winners with 139.82 bushels, and J. G. Culbertson of Dansville, fourth place winner with 139.27 bushels.

Corn Contest Champion

HAROLD METZNER, operator of the 257-acre Shaver dairy farm at Dover Plains, Dutchess County, N. Y., was crowned State Champion in the DeKalb New York Corn Growing Contest at a recent meeting at Syracuse. Harold missed the 1948 championship by a fraction of a bushel and told *American Agriculturist*, "Watch me next year—I'm going to win that trophy!"

To carry out his pledge, Harold produced 144.09 bushels of shelled corn to the acre—almost 16 more bushels than the 1948 winner, Allan C. Brownell of Valley Falls. On his heels were 11 other growers who beat 1948's best.

As far as officials of the DeKalb Agricultural Association, sponsors of the contest, could learn, Harold's 144.09 bushels is the highest yield ever authenticated in the Empire State.

"To get a big corn crop," the champion said, "fertility should be built into the soil over a long period. I like corn to follow alfalfa and ladino that has been heavily fertilized with 0-20-20 to give big yields for 5 to 6 years. In that way there is lots of potash, phosphorus and nitrogen in the soil."

Harold spreads manure with the spreader wide open and then applies 500 pounds of superphosphate to the acre separately to get an even application. He disks twice after spring plowing and then adds 400 pounds to the acre of 6-12-6 with the planter.

Because he has fertile land, Harold is going to narrow his rows from 36 to 32 inches and space kernels 8 inches instead of 10 next year.

Of the 108 growers in the DeKalb contest, 10 produced more than 130 bushels to the acre in their 5-acre contest plots. They were (with names of their counties and their production): Metzner; C. M. and R. L. Conklin, Cayuga, 139.82; Myron Sayer, Oneida, 139.44; J. G. Culbertson, Livingston, 139.27; Martin Wyffels, Ontario, 137.99; B. Kenneth Adams, Madison, 136.50; Kenneth Pedersen, Yates, 134.97; Walter Geisler, Madison, 134.86; Samuel T. Hall, Dutchess, 134.22; and Everett H. Keller, Oneida, 131.76.

Other county contest champions not in above group were: Ward L. Saunders, Chemung; Everett Shadic, Columbia; J. E. Carlsen and Son, Erie; W. W. Hawley, Jr., Genesee; John H. Bradbury and Son, Herkimer; Raymond F. Sawyer, Jefferson; William J. Fisher, Monroe; Elwood Bobzien, Niagara; Amber H. Towne, Onondaga; Roger Bentley, Orleans; Raymond M. Austin, Oswego; Taylor Brothers, Rensselaer; Frank Winkler, Schoharie; Leon Litzenberger, Seneca; William D. Hopkins, Steuben; Fred C. Hanford, Tioga; John Walker, Jr., Ulster; Wolff Brothers, Washington; Charles E. Kemp, Wayne, and Kenneth C. Winter, Wyoming.

—A. J. H.

Fertility Management in Northeast Orchards

(Continued from Page 6)

dolomitic limestone is used; increased availability of phosphates; decrease of essential elements which are toxic if present in too high concentration, such as iron and manganese; decrease of toxic non-essentials, such as aluminum and certain organic toxins; and substitution of beneficial bacteria for those less desirable.

New Jersey Tips

Trees for the home garden aren't forgotten by the experts. According to E. G. Christ and A. J. Farley, extension specialists at New Jersey, the home gardener can be successful growing fruit trees if he plans carefully the space between trees, fertilizes intelligently, prunes correctly and sprays for insect and disease control. They say 2 pounds of complete fertilizer such as 5-10-5 or 3-12-6 spread over the surface of the soil around the trees and two feet outward from the base during March and April will usually be enough for the first season. On poor soils a supplementary application may be needed during early summer.

The New Jersey men say that a

small quantity of poultry or stable manure spread on the surface makes a good fertilizer supplement. They say, after the first season apply fertilizer every November or during March or April, and increase the amount every season until the tree has reached full-bearing age. They say that a 10-year-old standard size apple tree will require at least 10 pounds of fertilizer, and that it should be remembered that peach trees usually need a little more fertilizer than apples and other fruit trees. They say it may be broadcast or applied in borings 18 inches deep and about 2 feet apart.

Maryland Cover Crops

For cover crops in Maryland apple orchards, C. O. Dunbar, associate horticulturist at the University, recommends 1 pound of ladino and 2 pounds of meadow fescue per acre in late April or early May. He says lime if needed, and fertilize with 300 to 400 pounds per acre of 0-20-20 disked into the seedbed. In poor, eroded soils he recommends use at the same rate of 2-12-12 instead of 0-20-20 the first year.

DOWN THE

By J. F. "Doc" ROBERTS

OBVIOUSLY livestock of any kind on any farm is a success or failure depending on the cost of intake per animal (which involves many factors) and the result obtained.

Sometimes I wonder if the average dairyman knows what it costs him to produce a quart of milk, how much it costs his neighbor, and what the *average* actual cost is. In other words, does he know how efficient is his livestock farming? The old-fashioned slaughterer used to say that if he had more money in the bank than he had a year ago, he knew he was making money. Today he's broke and out of business.

Strictly speaking, livestock feeding costs are much simpler to figure. Yet between individuals on the same road, even when feeding the same kind of animal costing the same money, the gain in weight-cost per pound varies as much as 5 cents for that pound. These variables include kind and cost of feed, individual differences in handling animals, and the variations in the animals themselves.

Animal Personalities

Failure is not a pretty thing, but I am more convinced every year that it is due more to the personality of the man and (don't laugh) the personality of the animal than any other one cause. In either case, no expense is involved except "time," which throws the whole blame on the man, because time is unimportant to the hog, cow or sheep. Animals differ as much in their reactions to feed, care, noise, sociability, dispositions and personalities as humans do. Lack of interpretation of these traits causes "behavior problems" and "frustrations" just as surely as it does with children or adults.

Most of you older ones have known horses that wouldn't work for one man but would for another; cows that did not do well until they got a new home; men that had no luck in raising heifers while a neighbor made a good living doing it; loads of cattle or lambs that were not good feeders on one farm but when sold they settled down and fattened for the new owner. Every farmer has had experiences of this kind and, with so many cases, the only real answer must be clashes in personality or lack of understanding between that animal or that group of animals and the owner. All this may sound foolish but it has convinced me that animals do have definite personalities.

"Know your animals" is of course the real purpose of all this. They must

LATHAM & TAYLOR Red Raspberry Plants, \$5.25-100. Premier Strawberry \$2.25-100. Fresh dug and postpaid. Order now for Spring. MacDowell Berry Farm, R.D. 2, Ballston Lake, New York.

STRAWBERRY plants, state inspected. Premier, Temple, Red Star, Maytime, Fairfax. \$3.00 per hundred. 10 extra plants free. Post paid. Harvey Bennett, Jr., Cedar Farm, Amagansett, Long Island, New York.

KENNETH McBride, Leicester, N. Y., first prize winner in the New York State Sheep Shearing Contest at the 1949 Cornell Farm and Home Week. Who will be the 1950 champ?

do well for you in these times or you are out of luck. If you have an animal that is not doing well, move it. Perhaps it just doesn't like you. If none of your animals are doing well, changing your attitude may be as important as changing the feed.

Mutual Respect

Most farmers probably won't admit it, but if they work with individual animals they pretty well know the ones that like them, the ones that don't, and the ones that just don't give a darn. The funny thing about this is that, as with humans, the ones you like, like you.

Now perhaps we can say, if you have an animal or numbers of them that you don't like, sell them, trade them off or do anything but go on having expensive mouths to feed that aren't returning that expense. The chances are these animals never will do well for you. Perhaps, too, right now with possible lower prices it is just as important not to sell the animals you like, that like you, and are doing well for you. Those kind are hard to gather together and should be worth as much to you as the next fellow. The other kind are always available.

Finally, if you have a high producing cow that has age and starts to go wrong, and old ewes that have started to go down hill, move them no matter how much you like them before they lose all value even as meat. An old Stock Yard expression is "Don't marry your livestock."

DELAWARE COUNTY DISPERSAL 100 Registered Holstein Cattle

THE AMERICAN GUERNSEY CATTLE CLUB

Sew for Spring!

By GRACE WATKINS HUCKETT

PLAIDS, checked men's wear, widely spaced prints and textured surfaces lend interest to spring fabrics, in addition to the classic failles which come in bright or dark colors.

Style is emphasized in wash dresses, giving them more of a streetwear look. Pockets assume a major role, for novelty as well as for utility. Skirts flare, colors are darker; eyelet trimmings are often featured.

Separates, skirt, blouse or sweater, and jacket are high in favor, being both practical and colorful. Boleros with cap-sleeved dresses make both serve a double purpose.

See how the darts nip the waistline in housefrock No. 2003 . . . how the front is smartly zipped . . . and the button-tab detail in pockets and collar.

The beloved shirtwaist is here again—this time in a new disguise. In No. 2092 soft flares are thrown forward in the seven-gore skirt and the collar points prettily.

Smart surprise dress No. 2085 stands alone or with its soft-collared bolero leads a double life!

No. 2441 is a basque-bodied beauty with a softly collared low oval neckline. Tiny buttons trickle down the back into a godet-inspired flip of fullness.

The smart 'separates' story is aptly told by No. 2047 which has a well-cut jacket with its hip-flanking pockets

atop the new, slimmer skirt.

Every Spring calls for a topper and No. 2846 is IT! Straight and boxy little-boyish front . . . and feminine fly-away flares at back!

Cummerbund-topped skirt No. 2896, pleated strategically for graceful movement, comes with snug-fit, petite-collared johnny jacket—for now and from now on!

Here is the perfectly suit-able blouse! No. 3054 has tiny dropped sleeves cut in one with the flattering scalloped yoke . . . simply elegant!

Easter-time special! No. 2590 is a button-closed princess style dress which comes in the same pattern with the classy cape.

No. 2952 is a Dutch cap to top off the ensemble; comes with two other hats . . . in the same pattern.

Attractive suit-dress No. 2424 leads Easter parade! Mold the fitted bodice to her young figure and let the peplum supply the sauce!

In No. 2053 twin godets burst from the tiny bowed waist . . . beruffle them for party-time. Panties included. Stuffed bunny rabbit No. 215 in a pretty pinafore makes a fine cuddly toy and is only one of a family of three.

Panel-front coat and dress ensemble No. 3036 make a cute pair . . . with hearts for pockets! Pretty, practical

Let's Talk Turkey

About This Threat To Your Welfare

Some time ago the anti-trust lawyers from Washington brought suit to put A&P out of business.

They asked the court to order us to break up our stores into seven groups and sell each group to new owners; to sell our factories to still other new owners; to disband the Atlantic Commission Company; and to close all our central buying offices, including the National Meat Department, the National Dairy Department and the National Egg and Poultry Department.

Since that time, hundreds of thousands of farmers, as individuals and through their organizations, have been adopting resolutions, writing letters and running ads expressing their opposition to this suit.

The Farm Bureau Federation, at its recent annual convention in Chicago, adopted a resolution that did not specifically refer to the A&P suit, but condemned current interpretations of the anti-trust laws. The resolution said in part:

"Regulations should not be used to eliminate the possibility of integrated systems that are efficient and competitive. Such systems have the possibility of bringing about a badly-needed reduction in the margins that now exist between the producers and consumers of many items."

The reason farmers are taking a stand against this suit is because they recognize that it is a threat to their welfare; a threat to all agriculture; and a threat to our national economy.

Have you figured out how much this suit could hurt you?

A Threat To Better Distribution of Your Product

A&P is the largest and most efficient distributor of farm products.

Obviously, this attack is a threat to the welfare of all the farmers who sell to A&P, for they will have to seek new outlets for their products.

That will mean greater sales effort and higher sales costs for them.

But it will have an adverse effect on millions of farm families who don't sell to us at all.

For the great amounts of food we move into consumption, the great merchandising effort we put behind food sales, tend to strengthen farm markets and boost the income of all farm families.

Everyone wants the farmer to get good prices for his products. After all, we can't have a prosperous country unless we have a prosperous agriculture.

The price you receive for your product is the retail price, less the cost of distribution.

To maintain good prices to farmers, therefore, we must eliminate unnecessary in-between handling costs and operations.

A&P was founded and has operated for 90 years on the theory that the best way to attract and hold customers and build bigger markets for farm products is to give the public more good food for their money.

In order to do that, and at the same time do a good job for agriculture, we have had to work constantly to find better and less expensive methods of distributing food.

As a result, we have narrowed the spread between farm and retail prices.

The methods we pioneered have been adopted by other food distributors. All agriculture has profited from them.

Today farmers get a larger share of the consumer's dollar. Their sales are higher. Their income is greater.

This suit threatens to wipe out many of these gains.

Don't you think agriculture will be hurt by this attack on its most efficient marketing outlet?

A Threat To Your Living Standards

The farmer is a consumer as well as a producer.

His "real" income is determined by how much he has to pay for all the things he buys.

This applies to food, as well as clothing and other necessities. For today, with the development of cash crop farming, practically no farm family produces all the food it needs.

A&P was the first of the nation's chain stores. Together with the other chains and mail order houses, it has worked to keep living costs down and living standards up.

The public has shown that they like our method of distribution by giving us and other efficient distributors their patronage. We are big because the public made us big.

If the anti-trust lawyers win this suit, a legal precedent will be established that can be used to attack anybody who tries to do a better job, give his customers a better deal, and grows big in the process.

Don't you think your living costs will go up if the company that has done most to keep them down is destroyed?

A Threat To Our National Economy

That is why we say that the big issue here is not whether A&P engaged in some practices that allegedly violated the anti-trust laws. We know we didn't. We know that we have always tried to run a good, clean business. Even if there were something wrong with our methods of operation, it wouldn't be necessary to burn down the barn to get rid of the mouse.

The real question here is whether the anti-trust laws, which were designed to preserve competition, can be turned around to reduce competition.

The real question is whether we are going to continue to encourage people to do a better and more efficient job; or whether we are going to let the lawyers in Washington blow the whistle on anybody who gets a little bigger than his competitor.

Frankly, we admit that nobody needs worry about the owners of A&P. They could make a great deal of money by breaking up this company and selling off the parts as the anti-trust lawyers wish.

But we think you and every other American should worry about the kind of economic policy the anti-trust lawyers are trying to impose on this country—not by way of Congress, as it should be, but by way of court decrees.

You may not sell to A&P or buy from A&P.

But this is your problem, too.

You don't have to believe us.

Think it over and talk it over with your friends and neighbors.

Decide for yourself.

DINNER IS SERVED: Girls in the homemaker class at Tully, N. Y., Central School were just sitting down to a baked ham dinner when our field editor, Jim Hall, dropped in. The dinner, cooked and served by members of the class, looked very appetizing, according to Jim, and he regretted he couldn't accept the girls' invitation to share it with them. Girls in the picture, from left to right, are: Eileen Aungier, Tully Valley; Marion James, Otisco Valley; Dolores Holl, Truxton; Dorothy Herold, Vesper; Marjorie Dudley, Tully Valley; Joan Chawgo, Truxton; Pearl Chapman, Marietta; Patty Dockstater, Apulia Station; Phyllis Branchley, Tully Valley; Joan Baker, Tully. Mrs. Mary F. Carruth is head of Tully Central School's Home Economics Department.

TODAY IN Aunt Janet's Garden

Winter Decorations

Have you any suggestions for a table centerpiece which is neither too expensive nor too much work? At this season it seems particularly difficult to have something attractive without undue expense.

—L. A., New York.

YOU DO NOT have to look far in order to get material for some rather interesting centerpieces. The vegetable bin would be your first resource. Select nice fat carrots, cut 2 inches from the upper part and stand in a shallow dish of water. In a few weeks you will have some dainty fern-like leaves. A flat bowl or even a small platter would be an attractive container.

Beets would also produce leaves but the beetroot should be set in a narrow mouthed container so that only the base of the root comes in contact with the water. The best-looking vine comes from the sweet potato. To grow this the container should have an opening large enough to admit half the tuber so that part of it is within the container and the rest exposed to open air. Since the sweet potato is kin to the morning glory, its vine is very attractive. Incidentally, vines differ a lot according to the variety of potato you get.

While you are thinking of plants which can be made to grow easily in water, do not overlook the Japanese evergreen, a relative of Jack-in-the-pulpit and the calla lily; other possibilities are the philodendron or jungle ivy, wandering jew, and English ivy.

Another suggestion for rooting cuttings, and at the same time provide some winter decoration, is to have a Wardian case; this could be the old square-sided aquarium with a pane of glass over it. Drainage material of fine gravel or sand at the bottom, with about 2 inches of soil above, provides the necessary foundation for almost any houseplant cuttings, begonias, ivy, ferns, and so on.

Other suggestions for winter decorations are branches of forsythia, pussy-willow, flowering quince and other early blooming shrubs which lend themselves easily to forcing indoors. I have seen pussy-willow and forsythia brought into bloom in early January. I usually make the change a gradual one by putting them into jars of water in the cellar and leaving them there

until the buds are ready to break; then I bring them upstairs. Of course, pussy-willows will flower if left in the water. When they have reached their full growth, I take them out of water, as I prefer them that way rather than flowered out.

—A.A.—

SEW FOR SPRING!

(Continued from Page 30)

... and all one pattern.

Cleverest yet! This highly styled soft-shouldered blouse No. 2084 has its front and back cut in just one piece ... and cuts from one yard 54-inch in any of its sizes.

Deceptively slim skirt ... until you turn around! The back of No. 2894 is laid in unpressed pleats for walk-away fullness. Perfect in any fabric.

PATTERN SIZES AND REQUIREMENTS

- No. 2003—Sizes 12-20; 36-46. Size 18, 4 1/2 yards 35-inch.
- No. 2092—Sizes 12-20; 36-48. Size 18, 4 1/4 yards 39-inch.
- No. 2085—Sizes 12-20; 36-48. Size 18, dress and bolero, 5 1/2 yards 39-inch.
- No. 2441—Sizes 12-20; 36-40. Size 16, 3 3/4 yards 39-inch.
- No. 2047—Sizes 12-20; 36-48. Size 18, 3 1/2 yards 54-inch.
- No. 2846—Sizes 12-20; 36-40. Size 16, 2 3/4 yards 54-inch.
- No. 2896—Sizes 10-20. Size 16, 3 yards 54-inch; 3/4 yard 35-inch, cummerbund.
- No. 3054—Sizes 10-20. Size 16, 1 1/4 yards 39-inch.
- No. 2590—Sizes 2-10. Size 8, dress, 2 7/8 yards 35-inch; cape, 2 1/4 yards 54-inch.
- No. 2952—Sizes 19, 20, 21, 22. Size 20, 3/4 yard 27-inch.

We Like Peanut Butter

By **BLANCHE CAMPBELL**

PEAUT BUTTER makes a filling, satisfying sandwich that goes well in the school lunch. It adds that much needed protein and is a wonderful blender with other foods. It goes with either fruits or vegetables and adds zest to any sandwich. Here are a few of our favorite combinations:

PEANUT BUTTER AND JELLY SANDWICHES

1/2 cup peanut butter 1/3 cup raspberry jelly
2 tablespoons cream Buttered bread

Mix peanut butter with cream and blend until smooth. Spread on slice of buttered bread. Add a layer of raspberry jelly and top with the other slice of bread. This is an oldie but one that is always good. Any flavor of jelly may be used.

RAISIN AND PEANUT BUTTER SANDWICHES

1/2 cup chopped raisins 1/2 cup peanut butter
1/3 cup apple butter Juice 1 lemon
2 tablespoons dark corn sirup Buttered brown bread

Wash and chop raisins and combine with apple butter, corn sirup, lemon juice and peanut butter. Blend and spread between thin slices buttered brown bread.

PEANUT BUTTER AND BANANA SANDWICHES

1/2 cup peanut butter 1 banana
2 tablespoons cream Buttered whole wheat bread
1 tablespoon lemon juice

Combine peanut butter and cream and blend until smooth and well worked in. Mash banana pulp smooth; add lemon juice to it. Combine the two mixtures and spread between thin slices of buttered whole wheat bread.

ZESTY PEANUT BUTTER SANDWICHES

1/2 cup peanut butter 2 tablespoons hot water
1/4 cup sweet pickle relish Buttered brown bread

Combine hot water, peanut butter and pickle relish and blend until smooth. Spread between thin slices of buttered brown bread.

PEANUT BUTTER AND CELERY SANDWICHES

1/4 cup peanut butter 1 tablespoon milk
1/3 cup finely diced celery Buttered white bread
1 tablespoon butter

Blend peanut butter, celery, butter and milk together, working until all are well mixed. Spread between slices of white or brown bread.

PEANUT BUTTER AND ONION SANDWICHES

1/4 cup peanut butter 1 slice sweet red onion
1 tablespoon mayonnaise Brown bread

Beat the mayonnaise into the peanut butter until smooth and spread two slices of buttered whole wheat bread with it. Place one slice of sweet red onion between the slices.

PEANUT BUTTER AND CARROT SPECIAL

1/2 cup peanut butter 1/2 cup grated raw carrot
1 tablespoon mayonnaise Buttered bread

Combine carrots, peanut butter and mayonnaise. Spread between thin slices buttered bread.

PEANUT BUTTER STUFFING

Remove the top of each baked potato to make it boat shaped. Mash or rice the scooped-out potato, add hot milk, butter, salt, pepper and peanut

OLD-FASHIONED ROLLED SUGAR COOKIES

(Recipe used by Mrs. Stuart Germond, Marcy, N. Y., the winner in the 1949 Grange-American Agriculturist Sugar Cookie Contest)

1/2 cup butter (1/4 lb.) 1/4 teaspoon salt
1 cup sugar 2 teaspoons baking powder
2 eggs 1 tablespoon milk
2 cups flour 1 teaspoon vanilla

Cream butter, add sugar gradually. Mix well. Add well beaten egg yolks and beat. Then sift in flour, salt and baking powder. Add milk. Beat, then fold in stiffly beaten egg whites until well mixed. Chill, roll, cut, and sprinkle with sugar. Bake at 425° F. for about 10 minutes. Makes about 30 cookies.

butter; beat well, fold in beaten egg-whites, pile lightly into potato boats, leaving tops rough. Put into shallow pan and brown tops quickly in hot oven.

For each 4 large potatoes allow 1/2 cup peanut butter, 1/4 cup milk and 2 egg-whites, 1/2 teaspoon salt and 1/8 teaspoon pepper. Taste mixture before putting into shells and add more seasoning if necessary.

These are only a few peanut butter ideas. With a little inventing, you may bring out some better ones of your own. But my folks all approve of these and yours will too!—B. C.

—A.A.—

PRACTICAL NURSING COURSE STARTS MARCH 6

IF YOU are over 18 years of age and I want to become a practical nurse, we call to your attention a new course starting March 6 at the Ithaca, N. Y., School of Practical Nursing. Classes are held Monday through Friday from 12:30 to 6:30 p.m. The course includes four months of classroom instruction, with a professional nurse and a home economist for teachers.

The student then goes to the Tompkins County Memorial Hospital, in Ithaca, for practical experience. She works 8 hours a day, five days a week,

and a professional nurse supervises her care of mildly ill, convalescent or chronically ill patients. A month's vacation and a final month in review complete the year's work. The student is then eligible to take the New York State examination for licensing practical nurses.

Requirements for entrance into the School are: The applicant must be over 18 years of age; must have completed the 8th grade in school, or be able to show comparable education by examination; must pass a physical examination and be considered a satisfactory prospect for training at a personal interview.

Further information about the course may be obtained by writing to Mrs. Ruth H. Thomas, Director of the Ithaca School of Practical Nursing, 117 East Buffalo St., Ithaca, N. Y.

—A.A.—

USE LEFT-OVER EGGS

To keep left-over eggs, cover unbroken yolks with water. Put whites or broken yolks in a tightly covered jar or dish and refrigerate promptly. Do not keep them too long.

To use, add either an extra white or extra yolk to scrambled eggs, custard, cheese sauce, cooked salad dressing, the egg-and-milk mixture for french toast or for coating croquettes, sliced tomatoes, egg plant, or breaded chops before frying.

Extra whites have a variety of uses — in souffles, meringues, gelatine sponge desserts such as old-fashioned snow pudding, in fruit whips, frostings for cakes, macaroons and other confections.

—A.A.—

To keep nuts-in-the-shell from becoming rancid, store them in a cool, damp place.

"NO MORE SLEEPLESS NIGHTS"

"I feel so much better since I no longer have to dread those awful sleepless nights! My 'insomnia' turned out to be due to caffeine in the coffee I drank. So I switched to POSTUM and now I get 8 hours of restful sleep every night."

Are sleepless nights, due to "coffee nerves", interfering with your good health?... Do you wake up in the morning, feeling tired and logy?... Then, try a switch to 100% caffeine-free POSTUM. See if you don't enjoy good, natural sleep that makes you feel better and enjoy life more.

SCIENTIFIC FACTS: Both coffee and tea contain caffeine. And caffeine is a drug that acts upon the brain and central nervous system. Also — in susceptible persons — caffeine tends to produce harmful stomach acidity. So, while many people can drink coffee or tea without ill-effect, others suffer nervousness, indigestion, sleeplessness. But POSTUM contains no caffeine or other drug — nothing that can possibly keep you awake!

MAKE THIS TEST: Give up coffee — give up tea — drink POSTUM exclusively for 30 days — and judge by results! Ask your grocer today for INSTANT POSTUM — A Vigorous Drink made from Healthful Wheat and Bran — 100% caffeine-free! POSTUM is a Product of General Foods.

Allan Kline Makes Hit at Fruit Growers Session

By L. R. SKEFFINGTON

THE 95TH annual meeting of the New York State Horticultural Society at Rochester was marked by the largest attendance in several years and stimulated interest in labor-saving or cost-saving equipment displayed in the trade show.

When President A. W. Densmore of Albion opened the first session, he remarked that the size of the crowd indicated growers had some problems on which they wanted information. Lloyd E. Slater of the Cornell economics department in summarizing the fruit situation said it called for increased efficiency in both production and marketing.

With a large crop of apples and low prices this season, much of the discussion centered around what to do about it. Tabulation of a questionnaire indicated growers were two to one against a guaranteed floor price under a government program.

Allan B. Kline, president of the American Farm Bureau Federation, ridiculed the idea that "we can have high prices to farmers, low prices to consumers, and it won't cost anybody much." He said the answer to current problems was not to be found in high price supports, with their increasing rigidity of control over farmers, but in "a high standard of production per man in agriculture. The fundamental basis of prosperity in agriculture is efficient production, well distributed real income, and high production by the rest of the economy."

'Year of Decision'

Kline told the society, "This may well be the year of decision." He said that if farmers want economy and common sense in government, the thing to do is to elect to Congress men who will make that their mission, and who will not be primarily concerned with their chances of re-election. He admitted frankly that the AFBF conducted a lobby for farmers, "but with only four field men in the country and a total staff of 30. In contrast, he said, the United States Department of Agriculture had 82,000 persons on its payroll, and the Production and Marketing Administration employed 850 in Chicago alone. He said farmers should insist that these agencies stick to their jobs of administration and quit lobbying.

Another speaker who evoked strong applause was Beverly Byrd of Winchester, Va., a son of Senator Harry F. Byrd and production manager of the world's largest orchards. Byrd attacked waste and over-expansion in government with a flair and vigor that intrigued his listeners. He said apple

growers have been facing increasing competition from citrus fruits. Since 1909, Byrd said, the demand for apples has decreased 50 per cent, while the consumption of oranges has increased 300 per cent, grapefruit 1,002 per cent, and ice cream 1,500 per cent. He said apple growers might take a lesson from this and consider the reasons. One reason, he said, was that "other producers have carried on a very effective campaign of advertising; secondly, producers of these products have stuck together and worked together."

Stable Prices Seen

The economic plight of apple growers this season was attributed by Dean W. I. Myers of the State College of Agriculture to the fact that "two things had struck at once." During 1949, he said, the long-expected post-war readjustment set in, and the apple crop averaged 20 per cent above normal. "Either of these things would have been bad enough, but their combination has resulted in severe losses for many growers," Myers said.

He foresaw a reasonably stable price level in 1950, with farm prices averaging 10 per cent below 1949. He said the current recession had been moderate, in contrast to the severe setbacks following the first World War, and he advised farmers to continue conservative operations.

Hubbard New President

E. Stuart Hubbard of Poughkeepsie was advanced from vice-president to president, with Horace M. Putnam of Lyons succeeding him. Daniel M. Dallymple of Lockport was re-elected secretary-treasurer. Densmore and Willis Phillips of Burt were re-elected directors. New directors are James Clark of Milton and Claude Bailey of Burnt Hills.

At the annual dinner honorary life-memberships were awarded to Harry D. Brown of Waterport, Grant Hitchings of Nedrow, and Fred W. Cornwall of Pultneyville.

On the technical side of the program, W. D. Mills, Cornell plant pathologist, said dry weather in 1949 gave growers a setback, but it also reduced apple scab after four years of heavy infestation. Damon Boynton of the pomology department reported that considerable progress has been made in developing methods by which growers may diagnose the fertilizer needs of their orchards. Discussing losses from stippen, Dr. Arthur J. Heinicke, Geneva station director, said this resulted from leaves exerting a greater pull than fruit for available water at certain times. He suggested among control measures that harvesting be delayed,

THE DAIRY COUNCIL of Syracuse is the first unit of its kind to be organized in this State. Affiliated with the National Dairy Council in Chicago, its aim is to promote optimum health for all individuals in Onondaga County, N. Y., through the adequate use of milk and its products. The unit is financed by producers and dealers. From left to right in picture are: Linn C. Beebe, Frank J. Brothers, Daniel Gates, William Crego, Curtiss C. Brown, Raphael L. Hicks, Stanley E. Murphy and, standing, Ambrose Amidon.

CENSUS BLANKS COMING

PLANs are rapidly taking form for the 17th Decennial Census of the United States of which the 1950 Census of Agriculture is an important part. In March a copy of the agricultural questionnaire will be mailed to every rural mail route boxholder in the Northeast, plus a letter requesting each farmer to fill out the questionnaire and have it ready when the Census taker calls in April.

and fruit stored promptly at low temperature and high humidity.

Dr. H. C. Young of the Ohio Experiment Station said the new mist sprayers look good as money-savers, but suggested growers use caution, as faults may be disclosed.

New Pie Queen

Bernadette Lappan of West Henrietta, 13, is the new apple pie queen as a result of a contest at the show. Second and third places went to Dorothy Dean of Marion, 18, and Miriam Dallman of Newfane, 17.

Sodus FFA chapter won the cups for fruit judging and apple exhibits, while Webster took the cup for identification of fruit diseases and insect injuries. Lloyd Powers of Geneva won the FFA speaking contest. Second and third places went to Richard Hollenbeck of Albion and Glen Marshall of North Rose.

GROWING PEAS FOR THE CANNING FACTORY

(Continued from Page 10)

heavy applications of stable manure and fertilizer, is important from the standpoint of stimulating growth and helping to overcome unevennesses of soil conditions.

Practically all of the seed used in this state is now treated with Spergon by the processors before being turned over to the growers, and this is very definitely desirable. Inoculation is rarely used in this state, as it has not generally been found helpful. However, it is not detrimental and there are some regions where its use seems to be desirable.

Fertilizer

The Agricultural Experiment Stations at both Geneva and Cornell are recommending that peas for processing be fertilized at the rate of five to six hundred pounds of a 10-10-10 fertilizer on the lighter soils and the same quantity of a 10-20-10 analysis on the heavier type soils. As the pea seed is sensitive to injury by fertilizer, it should always be drilled separate from the seed and somewhat deeper if possible.

"Now I Can SLEEP"

"Coffee nerves used to keep me tossing and turning. But since switching to POSTUM, I sleep soundly—and friends have commented on my improved appearance."

SCIENTIFIC FACTS: Both coffee and tea contain caffeine—a drug—a nerve stimulant. So, while many people can drink coffee or tea without ill-effect—others suffer nervousness, indigestion, sleepless nights. But POSTUM contains no caffeine—nothing that can possibly keep you awake!

MAKE THIS TEST: Buy INSTANT POSTUM today—then drink POSTUM exclusively for 30 days—and judge by results!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

GOOD NEWS FOR FRESHENING COWS

Low-Cost Help at Danger Month

A Kow-Kare build-up for Freshening is now a MUST. The new 50 lb. economy Drum cuts the cost by one-third for this famous conditioning supplement of Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D.

These replacement properties and promoters of smooth functioning of digestion and assimilation should be available to every freshening cow, with her feed, for a month before her calving ordeal. For producing cows on heavy feed, the usual need is met by supplying Kow-Kare one-week-a-month. Thousands of cow owners tell us how they have cut costly disorders to a minimum by this periodical Kow-Kare aid. Remember this...any size Kow-Kare is an investment, never an expense. Your dealer has, or will quickly get the size you can use most profitably.

TIME WELL SPENT

Time taken to read the advertisements in **AMERICAN AGRICULTURIST** is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad," be sure to mention the name of **AMERICAN AGRICULTURIST**

Freedom Is The Theme

Oldest Farm Society Warns Against Present Trends

EMPHASIS of all the speakers at the annual meeting of the New York State Agricultural Society, the oldest farm organization in the State and probably in America, was on the dangers of government control and regimentation, and the danger of too much dependence on supports. John H. Davis, Executive Secretary of the National Council of Farmer Cooperatives, summed up the statements of the speakers on the day-time program when he said:

"From a long range viewpoint we have made progress in agriculture not through planned farm programs and price supports but rather because we have gradually increased the productivity per worker per hour."

An Impressive Record

The New York State Agricultural Society was organized in 1832, and during all of the early formative years of the Republic the Society was a leader of the best in agriculture and rural life. Among its members and officers the Agricultural Society numbered many of the great men of the times. It established the New York State Fair, supported the county agricultural fairs in their early years, and either initiated or supported almost everything else in the way of farm progress.

In recent years the Agricultural Society has been interested in emphasizing and preserving the history of agriculture in New York State so that posterity may have some knowledge of and respect for its pioneer farmers. Particularly appropriate to these times and to the splendid history of the Society is its custom of citing farm families who have lived on the same farm for more than a hundred years. The Society's annual dinners are notable affairs, with tables filled almost exclusively with products from New York State farms. When one is privileged to attend and watch the citing of century farms and farm families, he never forgets the moving event. This year the program following the dinner in the evening was presided over by Mr. Earl B. Clark, Master Farmer, Norwich, Chenango County, and the invocation was given by Carl P. Fairbanks, Chaplain of the New York State Grange.

Century Farms

The farms and farm families cited this year were those of Nathan Oaks 3rd of Oaks Corners, Ontario County; James Slingerland LaGrange of Feura Bush, Albany County, and the Honorable James Wadsworth of Geneseo, Livingston County.

THE NATHAN OAKS FARM

The first Nathan Oaks was shipwrecked on the Massachusetts coast. His grandson, Jonathan 2nd, left Massachusetts and in 1789—ten years after the Sullivan Expedition—acquired title to land on which the family still lives. Nathan Oaks 3rd, who with his wife was present to receive the citation, still operates 300 of the original 600 acres as an extensive dairy and poultry enterprise. Jared Van Wagenen, Jr., led the family to the head table and presented them to Governor Dewey, who read the citation and presented them with a scroll.

THE JAMES SLINGERLAND LAGRANGE FARM

Most interesting, also, was the family history of James Slingerland LaGrange, presented for citation by the Honorable Berne A. Pyke, former Commissioner of Agriculture and Markets for New York State. The Van Slingerland ancestors came from Holland in 1617 and

settled in what is now Albany County in 1664. The farm which was cited descended to James Slingerland LaGrange from the maternal side. The citation pointed out that its recipient "personifies two families outstanding in Albany County for nearly three centuries." One of the prized possessions of the family and still in the old stone house is the musket, with bayonet attached, which was carried by a Revolutionary soldier who was a member of the family.

Representatives of the family present to receive the citation were Mr. and Mrs. James Slingerland LaGrange, his son, James Earle LaGrange, and his wife and two sons, Marvin Curtis LaGrange and Ronald Earle LaGrange, both of whom are active in 4-H Club work and are preparing themselves for careers in agriculture.

THE JAMES WADSWORTH FARM

Mr. H. S. Manley presented for citation the Honorable James Wadsworth and his family. In citing Mr. Wadsworth the Governor called attention to the great service that Wadsworth had rendered to New York and to the Nation. He was a member and leader in the New York State Legislature for years. Then he went to the U. S. Senate and, in recent years, has been a member of the House of Representatives for his western New York district.

Two Wadsworth brothers—the first James Wadsworth and his brother William — made their way across the wilderness to the Genesee Valley at the beginning of the 19th century. They acquired great tracts of land, and, in addition to being excellent farmers themselves, were exceedingly generous and helpful to their settler neighbors in helping them to get established under pioneer conditions in western New York.

Masters of Their Destinies

After Governor Dewey had paid tribute to Mr. Wadsworth for the fine citizenship of his ancestors, his family and himself, Mr. Wadsworth responded with a short speech which summed up and climaxed what all the speakers during the entire session of the Agricultural Society had been emphasizing. He said in effect that farmers do not stay on the land generation after generation because of financial rewards, for even in so-called good times for farmers their average net income is only about \$1,000. He said the real reason why farmers stay on the land is that up to now they have had some independence. They have been masters of their own destinies, but are now rapidly losing their independence. If farmers are going to continue to remain upon the land, said Mr. Wadsworth, ways and means must be found some way, somehow, to keep the liberties and the freedom that cost our ancestors so much.

After the citations, the Governor, in an interesting and informal talk, brought his audience up to date on some of the current problems of agriculture from the viewpoint of the State government and suggested remedies for these problems. Like Representative Wadsworth, the Governor was very emphatic about the need of preserving the liberties and independence of the farmer.

Sexauer President

Mr. Fred H. Sexauer, formerly President of the Dairymen's League Cooperative Association and a member of the League Board of Directors, was elected President of the Agricultural Society. Mr. Stanley H. Benham and Mr. Harold L. Creal were elected vice-presidents.—E. R. Eastman.

YOU GET BIGGER CORN YIELDS with these 5 star FUNK G HYBRIDS

- ★ FASTER STARTING
- ★ SUPER STANDABILITY
- ★ DISEASE RESISTANCE
- ★ INSECT RESISTANCE
- ★ DROUGHT RESISTANCE

To help you select the *right* Funk G Hybrid—the one developed for your soil and climate conditions—the one *tested and proved in your area*—the one most profitable for you, write for our new 1950 Hybrid Corn Booklet. THE YOUTH'S COMPANION

Old Thad's Stratagem

By MYRON B. GIBSON

FOREWORD

In this amusing and thrilling tale taken from the Youth's Companion of September 1892, you'll meet "Old Thad", one of the best story-tellers we've encountered in a long time.

THAD BAINBRIDGE, or "Old Thad" as he was known far and wide throughout north-western Minnesota, left his New England home at an early age, and emigrated to the beautiful lakes and rivers of what has since been well named the Park Region of Minnesota. Tall, raw-boned, sinewy, and capable of enduring as much privation as any Indian, he hunted and trapped wherever he found game and fur most abundant, in defiance of the savages who claimed that country for their own.

Years later, when settlers had driven away the Indians, as well as most of the game, Old Thad, too much in love with the locality to follow the Indians and the game, built a snug cabin upon the edge of a wide stretch of timber and meadow land where a deep, clear stream emptied into a lake of considerable size, and settled down to adapt himself to the new order of things.

He could never make up his mind to become a farmer, but spent his time in hunting and trapping as he had always done. A good neighbor he was. Whenever he returned from a successful hunt, a saddle of venison or bear meat was pretty sure to find its way to our house on the banks of the lake, in return for the hams and bacon which my father sometimes sent him.

My father was no hunter, but when I became old enough to handle a rifle, he often allowed me to accompany Old Thad on his expeditions. I went almost wild with joy whenever I was granted a holiday of this sort. Old Thad was a jolly companion, and one of the best story-tellers that I ever knew.

We had no end of sport, and met with many exciting adventures both on land and water; but my greatest delight was to sit by our camp-fire at night, and listen to the old man as he recounted his early adventures among the Indians.

His tales of hand to hand encounters, of cunning strategy, of hairbreadth escapes, all told in a manner that convinced me of their truthfulness, would fill a large volume if duly reported.

Coming down the Otter Tail one autumn day after a successful deer hunt, we landed to portage or carry our canoe and its heavy load down past one of the numerous rapids for which that river is noted. At the foot of the rapids we embarked once more to paddle down to a good camping place a short distance below.

"How'd you like to shoot them rapids, with a load of furs and traps aboard?" asked my companion, as we took up our paddles.

"I should want to say goodbye to my friends before I tried it," I replied.

"I wouldn't care to try it again myself, but I did it once," said Thad. "It was a ground-hog case though, I tell you, for I just had to do it or lose my

BOSTON, THURSDAY, SEPTEMBER 15, 1892

scalp. But I made the biggest haul of fur that night down in these woods that I ever made in my life. Tell you all about it when we get into camp."

"You see," he began, when we sat down to a supper of fried venison, hardtack, and coffee, with our feet to the fire, while the bark canoe, turned upon its side, protected our backs from the sharp west wind; "you see I'd been trappin' all the fall up above here, and caught the prettiest lot of fur you ever set eyes on. All this country belonged to the Mandan Sioux then. It was just about as much as a man's life was worth to let them Indians catch him in these parts.

"I hadn't seen the first red during all the time that I'd been trapping that fall, and I made up my mind that they'd all gone further west for their regular fall buffalo hunt. So I was paddling along as careless as you please late one evening, about a mile above the rapids, where that big creek puts in from the east.

"Well, I tuck a good look up the creek as I always did up every stream when paddling in hostile country, and what did I see come poking around a bend but the noses of a pair of big canoes.

"I know'd too well what was in 'em, and I didn't stop to get a good look at the crews, but just dug my paddle into the water, an' tried to get past the mouth of that creek and out of sight.

"I heerd the Indians give a yell just as I swept past the mouth. The next second, crack went a couple of rifles.

The bullets came cross lots through the tall grass, and went whistling over my head. Then I knew I was in for it.

"I saw 'twa'n't but a little way to the rapids, and quick as a flash I made up my mind what to do. You can bet that old birch-bark darted down stream for the next mile!

"The reds yelled like maniacs when they came out in the river and could see me paddling away from 'em. I could see there were four of them, two in each canoe. They couldn't be loaded much heavier'n I was, and they could catch me anyway by running ashore and takin' it afoot, but I knew they'd stick to the water as long as I didn't land.

"I tell you, if you ever get a parcel o' reds after you, just do something that'll make their black eyes pop out of their heads — something startling, you know. They're chock full of superstition, and born cowards, every one, where anything unnatural is concerned.

"When they see a fellow do something that they've no idee any human being would dare to attempt, it just strikes their weak spot every time.

"If they don't come to the conclusion that he is an evil spirit, and let him alone entirely, they're mighty sure to form a good opinion of his courage; and they know that they can't calculate at all on what's going to happen when they meddle with such a fellow. That just knocks the pluck out of the varmints.

"So instead of landing an' taking to my heels, which looked to be my only

chance of saving my scalp, I just paddled right straight on.

"But I didn't impress 'em very much, for I could tell by the way the Indians yelled that they thought I just didn't know enough to land! I s'pose they thought I was some greenhorn that didn't know anything about fighting Injuns, and was scared out of my wits to boot.

"They all paddled like Sam Hill, and kept up the 'tarnalest screeching you ever heard. Of course they gained on me fast, with two paddles to my one, and I wondered why they didn't shoot — the two that hadn't fired at first. But it didn't take me long to see what their game was.

"They thought I'd have to land when I came to the rapids, and they were holding their fire to pick me off at short range while I was making a landing.

"That tickled me so that I had to laugh, and I paddled all the faster as I got within hearing of the rapids.

"When I reached the first riffle, the reds weren't more'n twenty rods behind me, paddling and yelling like mad. I never let up till I could feel the swift current pullin' the canoe along. Then I turned round an' swung my old hat at 'em, and yelled like a steam-engine.

"Well, if you wouldn't 'a' died laughing to see them Sioux about that time. They stopped paddling and stared at me like they'd seen a ghost, as I went shooting into the big rollers. If I'd gone down without saying anything, they'd thought it only an accident; but when I laughed and yelled at them it made their hair stand on end!

"They could have popped me over as easy as nothing at the distance, but there wasn't one of them that had sense enough left to think of shooting. I felt kind of ticklish myself, but thinks I, 'In a case like this, the boldest course is always the safest.' If I can ride her through, I'm all right, and if I happen to bust upon a rock, 'twon't be no worse'n being hacked to pieces and scalped.

"I reckon I've steered a canoe through as rough places as any man alive, but, I tell you, I never got into such a roaring, whirling, mixed up mess of rocks and water as that was. My canoe jumped and dipped, and was half-full of water in no time. But I didn't happen to hit any rock, and soon I was sailing into smooth water.

"Then I ran her ashore at a sharp bend, jumped out into the river an' threw my steel traps into deep water beside a big rock, where I c'd find 'em agin. Then I flipped the canoe bottom side up, and set it drifting down stream. My furs and blankets I let drift too — looked jest as if I'd upset, and I knew the whole kit would be picked up by the Indians anyhow.

"I had got out of sight of the reds at a turn before I was half through the rapids, but I knew they'd land above, and come down the bank to see what had become of me. So I grabbed my rifle and ran down in the edge of the water till I come to the little creek a few rods below the rapids. I ran up the creek a few rods to where a nose of rock made a turn in it, and there I slipped off my wet moccasins and leggings and wrung them out and carried them, so as I wouldn't leave any

The naked trees
Bow to his will,

But not the little
Chickadee
That sings and sings
In the butternut tree.

Old Thad's Stratagem

(Continued from Opposite Page)

tracks of water on the rock when I went ashore. Then I hurried up to the top of the rise of rock and took shelter in some bushes.

"Well, I hadn't any more'n got hid before I saw 'em come tearing down, a couple of them on each side of the river. When the two on this side saw my canoe and things floating, they set up a regular war-dance. All was so natural that the canoe and paddle should go floating round the big bend if I was upset, that it fooled 'em.

"They might have had a little doubt about it, but when they ran down the river a piece further to look for my dead body—wanted to scalp it, I s'pose—they found my hat and paddle, and that settled it.

"One of them swum out and collected everything of mine; then all four went back up stream to where they'd left their own canoes. Then they carried them over the portage just the same as we did ours just now.

"After loading my things into my canoe again, they paddled all three canoes down to this woods and went into camp on the very spot we're sitting on.

"It was just about dark by that time. As soon as I saw their camp-fire blazing up and knew they were busy cooking supper, I fished my traps out of the water, and made a wide circle out on the prairie. I struck the river again just below this point of timber, and laid the traps on a big rock, where I could find them easy.

"You can bet that I meant to get out of them parts as soon as the reds went to sleep, and I didn't calculate to go afoot, neither.

"Maybe them reds didn't have a pow-wow that evening after they'd inspected my kit, and hung my wet furs and blankets up to dry!

"I crept up close enough to see what they were doing. They had one canoe turned up on one side of their fire just like ourn here, and the way they laughed and talked and roasted ven'son and gorged was a caution. I couldn't make out their gibberish, but I knew well enough that they was bragging about the nice lot of fur they'd captured, and telling how they'd be sure to find my body floating away down river next day, and get my scalp.

"I thought they'd never quit laughing and eating, but they did finally, and wrapped their blankets round 'em and snuggled up to the canoe with their feet to the fire.

"I waited till I thought they were asleep, and then crept round to where they'd left the other canoes. Well, I just about busted to keep from laughing when I see how they'd left things!

They'd made so sure that I'd gone to the bottom that they'd emptied them furs out of one of them canoes into the t'other one, and left that and mine right on the bank with all four of their own paddles and mine too.

"They'd turned my canoe bottom side up to dry, and hung my blankets and such of my furs as were wet over a limb fer the same purpose.

"I got my canoe into the water without a sound, piled in my things, and then peeped into theirs to see if they had anything worth taking. I didn't much expect they had, but when I came to lift things out, confound my picture if they didn't have a whole raft of beaver an' otter.

"I thought I had a good lot myself, but they had twice as much. It didn't take me long to get it out of their canoe into mine, I can tell you.

"'All's fair in love and war,' says I, 'and you can consider yourselves lucky to get off so cheap.' You see I could have killed every one of the sleeping villains as well as not. It was against my principle to kill an Indian unless it was necessary.

"Besides, if I'd killed them while they were asleep, they'd never have known how bad I had fooled them; and that was tickling me as much as they were tickled at finding all of my fur. So I shoved their canoe into the water, and towed it behind mine as I paddled down stream.

"I took every one of their paddles, and kept them, too, many a day.

"When I knew I was out of hearing, I knocked their canoe inter bits with my hatchet. Then I took my traps aboard, and set in to do some tall paddling.

"My canoe was loaded nigh down to the water with all that fur, but the current was mighty swift, and a big load didn't make much difference. I knew the Sioux wouldn't open an eye before morning, and with that much start I wasn't afraid of them catching me.

"Fact is, after what'd happened, I didn't much think they'd care to follow me. And they didn't, neither. Leastwise, I reached the trading-post and got the money for the furs without seeing hide nor hair of any more Indians."

— A. A. —

"Dark Trees To The Wind," By Carl Carmer

As Stephen Benet put it: "Legends and yarns get down to the roots of the people. They tell a good deal about what people admire and want, about what sort of people they are."

That is what Carl Carmer has done in DARK TREES TO THE WIND, told about the people of York State. Who could fail to be fascinated by the story of Lon Whiteman, America's greatest embezzler, who was yet loved and defended by the people of his hometown; who wouldn't thrill to the valor of the losing fight waged by Deskaheh, Cayuga Indian Chief, who crossed the Atlantic twice, once to seek British aid and once to Geneva, Switzerland, to bring his people's cause before the League of Nations.

The story of the Fowlers, the first phrenologists, will interest you. They made a fortune out of reading the bumps on people's heads. And perhaps the most adventurous of all the stories with which the book is filled is that of Nils Szolteyki von Schoultz, a 29-year-old Pole, who after suffering untold sorrow and hardship during the defense of Warsaw in the Polish-Russian war, managed to reach America.

And so the book goes on, filled with interest. Rural people will enjoy the story of Green Valley Grange 881; in fact, the book makes good reading for anyone. It is obtainable in all book stores or direct from the publishers, William Sloane Associates, New York City. The price is \$4.00.

Kernels, Screenings and Chaff

By H. E. BABCOCK

I AM WRITING this on a trip north from Ft. Lauderdale, Florida. Mrs. Babcock and I are spending our third winter there.

We have gotten to know quite a few permanent residents of Ft. Lauderdale, and expect before the winter is over to see a great many friends from the Northeast, and Ithaca in particular.

This year I have had a break. A friend of mine who has been a New York dairyman has established a 200-cow dairy herd on a 360-acre tract of land within a few miles of where we live. My friend has assured me that I am at liberty to watch his operation closely. This gives me the opportunity to produce milk by proxy in a sub-tropical climate and to learn without risking my own money the handicaps of such an operation, as well as some of the advantages, such as practically no investment in buildings.

Next Summer's Experiments

One of the reasons for my trip North is to line up plans and equipment for the experimental work we will do at SunnYGables next summer. We like to try out one or two new practices a year. The purpose of these experiments is two-fold: We like to have something interesting going on and, if possible, turn up information which I can report here for what it is worth. We have been doing this for a long time. Many of the practices we have tried have not worked out. A few of our trials have given others ideas along the same lines, and they have developed something useful. This is the way progress is made.

Grass Silage

Last year we dug a trench up through a bank and used it to store chopped grass silage. The trench is about 12 feet at its deepest point, 12 feet wide at the base, 18 feet wide at the top and about 80 feet long.

Except for putting a stone drain in the center of the trench, we did nothing more with it than slope the sides at angles we thought would keep the dirt from sliding down.

It is now apparent that we have one side sloped about right, but the other is too steep. We also need to do some work on the floor of trench, either grading it better or putting in paved strips for the tractor wheels to run on. During long periods with warm rainy weather the floor has

become too muddy for comfort in getting out silage.

Except for the two alterations mentioned, which certainly won't cost much, we are entirely satisfied with the way the silage has kept, and with its quality. We have, however, learned a bit about covering the silage on the exposed top and end and handling the feeding of it so that we will be able to eliminate some wastage which took place this year.

The Next Step

This coming summer we are going to take our next step in cutting down on the cost of grass silage. It will take considerable nerve, but we believe there has been enough experience to justify what we are going to do.

We are planning to fill the trench late in May with a mixture of alfalfa and brome grass which we expect will run by weight about 90 per cent alfalfa and 10 per cent brome.

We plan to cut this with a tractor mower to which is attached a windrower. We hope to cut it all before it blossoms. We will let it wilt in the windrow to what we think is a safe point, and then we will haul it either with a buckrake or a hayloader on a dump trailer into the trench and try to pack it in tightly enough so that it will make good silage. Packing will be accomplished by repeated driving through and through the trench over the green hay with a tractor and buckrake, or a tractor and trailer. When the trench is finally full, we hope to have it heaped high enough so that after the settling takes place, the silage still will have a crown top extending above the sides of the trench.

When we finish filling, we will put bags of ground limestone on top of the silage, slitting each bag with a knife as we lay it down. In addition to furnishing desirable weight, ground limestone runs together and makes for the silage a roof which is quite impervious to rain. Of course, as the silage is used out, the limestone is removed with a little spoiled silage just under it, and spread on the land with the manure spreader.

Sulphur Dioxide

Three years ago, I believe it was, we began experimenting at SunnYGables with the use of sulphur dioxide gas for sealing off traditional tower silos. Since this initial trial,

The above picture shows a modification of the tractor-pull irrigation system we had at SunnYGables, adapting it for use in irrigating row crops. The wheel on the crate shows how the system operates over rough ground.

sulphur dioxide has been tried out by a good many farmers and seems to give promise of being very useful in making of better quality silage. Quite likely, therefore, we will thoroughly impregnate the silage in one end of our trench from top to bottom with sulphur dioxide gas and see what happens. My guess is that we will make some very nice silage this way; that it will come out green, with a good odor and with a very high Vitamin A content.

Low Cost Beginning

My present preoccupation with the cost of operating dairy farms is based on the fact that I am working with young men who have got to earn out of their farming operations their living, their taxes, insurance and interest, and anything that they succeed in paying on their debt.

I am also interested in lower costs on dairy farms for the very simple reason that I am sure milk is not going to bring as much as it has been bringing in the past.

Careful Approach

Throughout my lifetime I have found it easy to spend money. It's the simplest thing in the world to take a farm practice and improve it through the use of more labor and more machinery. Most farmers will do this if they have the money or even the credit available.

What I am trying to do at SunnYGables is to make top quality grass silage out of unchopped, early cut, wilted grass without buying anything to mix in it; by storing it in a hole in the ground; by handling it with no more equipment than a tractor, a tractor-mower and a buckrake; or if I can't get a buckrake which will work, with a two-wheel dump trailer and a green crop hay loader. One man will be expected to do the work.

Even if I succeed beyond my wildest hopes in making good grass silage with this simple and cheap one-man set-up, I don't expect that very many farmers will be interested in copying the idea in its entirety. Just naturally, they will want to improve on it. This means that they will want to buy cheap silos, ex-

pensive silos equipped with unloaders, stationary choppers, field choppers, molasses and grain to mix with the silage, an extra tractor, self-unloading trucks and trailers; in fact, everything which goes with modern silage-making because each item, either on its own or in combination with other equipment, does a job.

I figure, however, that it is a better approach for beginners to try to make good grass silage with minimum equipment and labor, and proceed from there, than it is to load up with too expensive methods and too much equipment at the start.

Irrigation

While we are experimenting with the preservation of grass as silage, we shall be growing it on an irrigated pasture. We have ten acres already seeded to winter barley and rye. In the spring this will be partially seeded to ladino clover and orchard grass, and the balance to ladino clover and brome grass. On part of the field we may also make a light seeding of some other grasses.

We hope that the barley and rye will be ready for grazing about April 1, and that by irrigation, applying fertilizer through the irrigation system, grazing management, and clipping, we can convert the field during the summer into a more or less permanent pasture with ladino clover as the predominating legume.

Pasturing Alfalfa

The third practice which we shall try out will be the grazing of a five-year-old stand of alfalfa and brome grass in early spring. As I have reported here, one of Governor Dewey's neighbors has been doing this for several years. He claims that because his cows like it better, they eat the grass first, thus giving the alfalfa a better chance. They then go to work on the alfalfa and set it back a couple of weeks. This is something I am sure Jack Conner at SunnYGables would very much welcome. Otherwise, he has too much alfalfa to handle when it should be cut.

PROTECTION

against acids!

against freezing!

you get DOUBLE PROTECTION with the Marietta Air-Cell Silo . . . now made with AGLITE

When you buy a Marietta you insure the safety of your feed-crops in two important ways. First, every extra-thick, extra strong stave gives you *Locked-In Air Insulation*. Second, you get the added protection of acid-resistant AGLITE . . . a manufactured aggregate that is pre-fired . . . pre-shrunk . . . one of the best heat-insulating materials known. There is no better concrete for silos than AGLITE.

It's perfect for grass silage!

A "Marietta" is perfect for grass silage. Its air-tight, smooth-walled interior preserves this carotene-rich feed and enables you to take advantage of the 12% to 50% higher production rate of cattle fed with wilted grass in place of hay.

All Marietta Silos are erected on the spot by efficient Marietta construction crews . . . factory-trained in Marietta methods. Write today for free literature about Marietta Air-Cell Silos and easy financing plan. Ask for "Green Fields Are Gold," our free booklet on Grass Farming.

By H. L. COSLINE

A SOUR NOTE

Over a year ago, one of our subscribers signed a contract with Eugene A. Panzone of The Music Publishers of the World in New York City. Mr. Panzone was supposed to print and distribute 500 copies of the subscriber's song, and was paid \$69.50 by check to cover cost of printing, mailing, etc.

The subscriber received many promises but no printed copies. We received a letter from Mr. Panzone in September, promising to give this matter his immediate attention. Since then we have had no answer to letters written him. The contract has now expired, and the subscriber wants his money back.

We have never run across a case where a song has been introduced to the public on a large scale through one of these so-called music publishers. Song-writing is a highly specialized and competitive field, and nearly all of the popular songs of today are especially written for some show or movie, or else they are first introduced by some well-known singer or band. An amateur has almost no chance of breaking into this field.

— A.A. —

EXPENSIVE?

I recently attended a party given to demonstrate stainless steel cookware and heard some comments there as to the dangers of using aluminum utensils. Is there any basis for these remarks?

There certainly has been unfair competition by salesmen of cooking utensils. Perhaps the unfairness is not all on one side. Anyway, cooking utensils, either stainless steel or aluminum, have many good qualities. It has seemed to us, however, that this "party" method of selling is expensive and that cookware of comparable quality can be bought for less money at stores.

— A.A. —

SEE THIS WAGON?

During the week of Hallowe'en, my old-fashioned milk wagon turned up missing, and all my efforts to locate it have failed. It is about 40 years old and is of great sentimental value to me. I am in the dairy business, and I had planned to use this wagon for display purposes. It is entirely enclosed, has large wooden spoke wheels on the back with smaller ones on the front, and has thills.—O. H., Trumansburg, N. Y.

If any reader has seen such a wagon, please drop a line to O. H., Service Bureau, Box 367, Ithaca, N. Y.

— A.A. —

GONE

I paid \$12 for a three-year subscription to "Junior Magazine" for my daughter, and received only three copies. Would you see if you could get this straightened out for me?

This subscriber is out of luck. We wrote to Progressive Educators, Inc., in Chicago, publishers of this magazine. Our letter was forwarded to Los Angeles, Calif., and then returned to us by the Post Office marked "Out of Business."

— A.A. —

DISSATISFIED

I recently bought about \$70 worth of Red Comet fire-fighting equipment. We tried three of these "bombs" on a wood fire, one at a time, but they were not effective. Do you know anything about these extinguishers?

Underwriters' Laboratories, Inc., advise us that bulb type carbon tetrachloride fire extinguishers like these are not approved by them. Therefore, they have no official information available for distribution relative to this product.

We feel that it is wise to buy fire-fighting equipment which is approved by the Fire Underwriters.

Heavier Payloads, Lighter Pull

NEW IDEA Spreaders have big, heavy-loading beds—built to withstand the impact of extra-heavy loads dropped by the loader . . . such as partially frozen chunks, large clods, etc.

NEW IDEA Spreaders are quickly loaded for action; can be handled in close quarters; only in turn short or back up, smoother rolling under all field conditions.

that's why a NEW IDEA is a good idea!

No. 12A Tractor Drawn
90 bushels capacity

No. 14A Tractor Drawn
60 bushels capacity

No. 10A Team or Tractor
70 bushels capacity

New Idea Lime Spreading Attachment:

A simple, inexpensive attachment makes your NEW IDEA Spreader an equally efficient lime spreader. Close-to-ground delivery assures excellent distribution with least waste.

Take to the fields daily with a NEW IDEA Spreader. That's the ideal way to apply manure — to improve your land and keep it in bumper-crop condition.

And it's an easy plan to follow when you own America's top soil builder. You use far less time and effort to hitch a NEW IDEA Spreader. Bed and sides are made of select cured lumber, steel-framed . . . low-slung and flared to let you build higher loads faster . . . outlasts other types by many years. These light-running machines pulverize, shred and spread manure with unmatched efficiency. Spreading action is conveniently controlled to suit any soil requirements.

Greater capacity and lighter draft alone assure you a bigger pay-off from every load handled with a NEW IDEA Spreader. Add such features as non-choking cylinders, wide-spread distributor, positive traction — just a few of its many important advantages — and you'll want to be seeing your NEW IDEA dealer soon! NOTE TO SURGE USERS:

It might interest you to know that since January 1, 1949, your neighbors have discarded more than 20,000 Long Tube Milkers so they could install a Surge!

Every day a lot of them decide that you were right!

In 1949 More Thousands of Farmers than Ever Before Switched to SURGE!

MANY MILLIONS OF MILKINGS on many kinds of cows over a period of many years would seem to be about the best guarantee that a milking machine can have.

MANY MILLIONS OF MILKINGS have so well satisfied so many farmers that the Surge is the machine they want that during 1949 *more thousands of them than ever before** have switched to a Surge.

AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

New England's Agriculture Offers

Happiness and Success

By ARTHUR L. DEERING

Dean, College of Agriculture
University of Maine

▲ New England beauty following an ice storm.

New England agriculture is productive. ▼

LET US LOOK at the New England scene. Many people who have not taken the pains to delve below the surface, nor examine the facts, are referring to New England agriculture as decadent. They point to the fact that the number of our farms has decreased. They indicate that we no longer grow our grains for our livestock and poultry, that our dairy cows have decreased in number, that Mary's little lamb that followed her to school one day has likewise disappeared.

All of these situations, so apparent on the surface, are merely an indication of the changes that have taken place in agriculture and will continue to do so as we meet the competition of other areas. In reality, nothing can be farther from the truth than that agriculture in New England is slipping. Agriculture in the Northeast has gone through much of the change and reorganization that has and is now affecting industry in this region. The Northeast is primarily an industrial area, but our industrialists, faced with competition with other areas, have been changing and must continue to change to provide opportunities for industry, labor, and agriculture.

Here in the Northeast, industry and agriculture go hand in hand. Certain it is that agriculture cannot prosper without a vigorous, healthy industrial development. Neither can industry expect the high quality of agricultural products at the reasonable prices that the consumer now enjoys unless they are produced here on our nearby farms. Someone has said, and I would not put it past a Maine man to say it, that it takes Maine soil, Maine climate, and a Maine grower to produce a Maine potato. Certain it is that our cool, moist climate, our soil and the industry of our farmers produce superior products.

Now let us examine more closely agriculture in the rest of New England and see just what the situation is. Here are some facts,

(Continued on Page 12)

▲ Spires pointing skyward indicate Faith in God.

Thrift, as shown by bountiful wood piles. ▼

Feed costs *can* be cut

A sharp pencil / and a little figuring can take dollar's out of the feed bill

THIS is a time for every dairyman to take a realistic look at his feeding practices. It's a time to go over carefully the feeds, ingredients, and services your local G.L.F. can provide, to see where savings can be made.

Some things to think about:

1. G.L.F. Patrons' 20% Cow Feed. This dairy feed has been formulated for the dairyman who wants to stick to a 20% protein feed, while cutting his dollar outlay to a minimum. It is a 3% feed, at several dollars a ton less than G.L.F. 20% Exchange Dairy.*

2. Save on Protein. Generally speaking, ingredients high in protein are expensive. When good roughage is available, cows will milk well on lower protein feeds. G.L.F. 16% Dairy, comparable in quality to Exchange but lower in cost, is a real feeding buy.

3. Molasses is Cheap. It is the best feed buy on the market today. Molasses can be used to get cows to eat more of the lower quality roughages and can be mixed with grains wherever mixing equipment is available. It can be used in the dairy barn by diluting with water and sprinkling on grain as it is fed to cows.

4. Reduce Handling Costs. Off car service is again being offered by many G.L.F. Service Agencies. By knowing your requirements ahead of time, your agent-buyer or store manager can order straight or mixed cars of dairy feed for you and your neighbors and advise you of the arrival date. Pick it up directly off car. This eliminates warehousing as well as several handlings. The savings go to farmers purchasing their feed off car.

5. Farm Grown Grains. In using any remaining home grown grains, find out what ingredients are the best buys for a local mix or for home mixing.

6. Seed and Fertilizer. Good seed is the base of a cheap source of feed for the dairy cow. The present price supports on grain and the high transportation costs are more and more showing up the value of better meadows and pastures and greater production of hybrid corns and small grains. Plan your planting this spring to cut your feed purchases next winter.

* * *

No one feeding plan will fit every dairyman. For some the Super Feeds will continue to represent the best value, the fixed formula, high fat and exceptional quality justifying the extra cost. For many, perhaps most, one of the standard G.L.F. flexible formula feeds will remain the most practical choice. Every dairyman, however, can profitably review his feeding rates, think about protein level, and study the reduction of feed handling costs.

Careful selection among the services listed here and others that may be available locally can mean real savings. Your local G.L.F. man is ready, willing and able to figure with you on your feeding needs between now and grass.

Cooperative G.L.F. Exchange Inc.
Ithaca, New York

***G.L.F. Patrons' 20% Cow Feed**

This new formula has been put together to make full use of the bargains in feed ingredients now available on all markets. They are used in proportions which will make a palatable milk producing feed at a lower cost. G.L.F. 20% Cow Feed has a 3% fat guarantee. While it is lower in total digestible nutrients than Exchange Dairy, the cost per 100 lbs. TDN is less.

G.L.F. Feed Services for Dairywomen

Artificial Breeding Plus Good Herd Management Pay Off

By MILES R. McCARRY

Berkshire County, Mass.,
Associate County Agent.

WHEN Winthrop White, young New Ashford, Massachusetts, dairyman, enrolled his herd in the Berkshire County Selective Breeding Association, he decided against selling his bull. He recognized artificial breeding as an unprecedented opportunity to raise higher-producing replacements, but the fact that so many of his neighbors were experiencing poor results in the program led him to adopt a "wait and see" attitude.

White's misgivings (and his herd bull) have disappeared and the entire herd of 58 Holstein and Guernsey cows and heifers is now being bred artificially to the outstanding proven sires in use by the breeding association. The reason for this changeover can be easily found in a study of the herdbook.

Of the last 28 cows bred, 21 have conceived on the first service. This rep-

Winthrop White, New Ashford, Mass., has proved in his herd that good management on the part of the farmer helps an artificial breeding program.

resents 75% of all animals bred and compares most favorably with the results normally obtained from natural breeding. Furthermore, no less than six of the seven remaining cows conceived on the second service.

Boris DeBussy, the inseminator in White's territory, is one of the top breeding technicians in the state and, without doubt, deserves a considerable portion of the credit for this fine record. However, the fact that the conception rate in this herd is considerably higher than the county average reflects good herd management practices as well.

Watches Dates Closely

Winthrop White believes that to get good results from artificial breeding, the herd owner must regard the inseminator as a partner—a partner to be co-operated with in every possible way. He also feels that a pencil is as useful to him as a milking machine and he keeps careful records on every cow on the farm.

Breeding and calving dates are carefully recorded and the entire herd is examined twice daily for evidences of heat. The dates and lengths of all heat periods are entered on the barn breeding charts whether the cow is bred or not. This information, which makes it possible to figure ahead to the approximate time of the next heat period and observe each individual cow accordingly, has proved especially useful with

you can get . . .

THE FAMOUS **Firestone** CHAMPION CURVED BAR TRACTOR TIRE in Either **OPEN CENTER** or **TRACTION CENTER** Design

SOME farmers prefer Open Center tires, while others demand Traction Center. Regardless of the type *you* prefer, Firestone has it. No one else offers you a choice, because Firestone alone provides both tread designs.

If it's Open Center design you want, see the sensational new Firestone Champion Open Center, Curved Bar Tractor Tire. Try it—for traction, for cleaning, for smoothness on the highway, for all around performance. You'll find it's away ahead of any open center tire ever made.

If it's the Traction Center Tire you want, there's only one—the patented Firestone Champion. This tire has long been recognized by thousands of farmers the country over as the top performer for year-around work. A test on your own farm will show you.

So again we say, regardless of your preference in tractor tire tread design, see your Firestone Dealer, your Implement Dealer, or Firestone Store. There's no need to shop around any more. *Firestone has everything in tractor tires.*

Listen to the Voice of Firestone every Monday evening over NBC

EGGS AND POTATOES IN TROUBLE

WITH THE price of eggs at the lowest point in many years for this time of year, poultrymen are wondering and worrying where their business is going from here. Not the least of their worries is the fact that in recent years the government has bought and stored about a million dollars worth of dried eggs in an effort to maintain poultry prices. These dried eggs are now beginning to spoil. They cannot be put on the market without depressing prices still further, and there's no market for them abroad.

Potatoes are in a similar situation, with thousands of bushels in government storage and no market outlet for them.

Newspaper columnists and radio commentators are writing and shouting about the waste and injustice to consumers and taxpayers of these government efforts to subsidize the farmer, all of which is proof, if thinking farmers needed any, that these government programs in the long run do more harm than good. Price supports must be lowered to where they do not result in surpluses. The only alternative is rigid, arbitrary government control of the farm business, and the end of that policy will soon come when Congress gets sick of appropriating money for such programs. The appropriations will then be discontinued—but the rigid controls will remain.

IT'S A COMER

MANY YEARS ago Ed Thomson (then President of the Federal Land Bank of Springfield), the late Carl E. Ladd (then Dean of the New York State College of Agriculture) and I spent a day walking over a hill farm in eastern New York, studying the marvelous pasture growth that this farmer had from birdsfoot trefoil. The pasture was rough, stony, and hilly. Although it was still in the forenoon, a big herd of dairy cattle were lying in the shade and chewing their cuds, because the pasture was so good that it had only taken them a little while to fill up.

Carl and I were so enthusiastic over that wonderful pasture that we came back determined to try to arouse some interest among dairymen for birdsfoot trefoil. But the public wasn't ready yet, and it is my observation that you never can move with anything new, no matter how good, until the public is in a receptive mood.

The years came and went, and meanwhile, slowly but surely, the knowledge of the worth and value of birdsfoot was spreading in eastern New York. We of *American Agriculturist* have been talking about it now for several years, and the agronomists and the colleges of agriculture and county agents are emphasizing the value of birdsfoot. Last week a speaker told a meeting of Grange deputies here in Ithaca that there was a place for at least some birdsfoot on every dairy farm in the Northeast, and another speaker said that in New York State alone there will in time be a million acres growing birdsfoot trefoil. They are right.

Why is this plant gradually coming to be recognized? Because it is a legume, high in protein, which will grow where other legumes will not, for once established, it stools out and re-seeds itself and becomes permanent.

If you can get some birdsfoot seed, write *American Agriculturist* or your college of agriculture, or your county agent, for instructions on how to plant it. Give it a trial.

MILD WINTER

AS I LOOK out of the window this middle-of-February morning, a mild blizzard is raging, about the first we have had this winter.

Always when we get unusual weather there are those who say that our climate is changing, but scientists don't agree with this statement, for the most common thing about our weather here in the Northeast is its uncommonness!

It has been a good winter for milk and egg production, probably not too good for meadows and for winter wheat. There's something in the old Yankee saying that snow is the poor man's manure; it prevents heaving and furnishes moisture.

By E. R. Eastman

When I think of our variable weather here in the Northeast, I remember what an old lady from New Hampshire once wrote me. She said: "Weather is something we have a lot of." There's a story, also, of the farmer who had seen a good many winters up on the border between Vermont and New Hampshire. As many of you will recall, for years there was disagreement as to where the line ought to be between the two states. Finally it was decided, and the tax collector told this farmer that his farm was no longer in Vermont; it was in New Hampshire.

"Good!" said the old farmer. "I don't know how much longer I could have stood those Vermont winters!"

STATE AID TO HELP COUNTIES CONTROL RABIES

UNLESS you live in a county afflicted with a large number of rabid foxes, it is impossible to realize the importance of completely eradicating them. During the past five years, 1,235 cows have been destroyed or have died from rabies in fifteen to twenty counties in central and southern New York. In addition there have been many other animals with the disease, all starting with rabid foxes. Worst of all, these animals are exceedingly dangerous to human life.

During the past several years the State has employed professional trappers to trap foxes, and while this work has been good it is not good enough, for the rabid foxes still persist, and in some sections are worse than ever.

Further to meet the problem, Assemblyman Harold C. Ostertag and Senator Floyd E. Anderson, under the sponsorship of the Joint Legislative Committee on Interstate Cooperation, have introduced a bill providing for State aid to counties to help them eradicate the wild animals which are spreading rabies. The bill calls for a State appropriation of \$60,000 to implement its provisions, to be shared with the counties putting on their own local program for destroying these dangerous animals, up to a limit of \$6,000 to each participating county.

The bill is sound and necessary. If rabies is a problem in your county, ask your representatives to support this legislation.

FOR MEN ONLY!

I DON'T KNOW when I have had so much fun as I had recently while leafing through a stack of old mail order catalogs that I found in a garret and reading the descriptions of clothes women used to wear. How these particular mail order catalogs ever escaped their usual fate on a farm, I just cannot figure out!

If you think that the queer, dinky little hats that women wear now are funny, just recall the hats worn by flappers back in the 20's, with brims so wide that they actually were like umbrellas over their shoulders. Or go farther back and take a look at that wonderful combination of birds nesting in a bunch of grapes and flowers, with maybe two or three feathers sticking out in every direction, that once constituted a hat.

You'd wonder, too, how in the world women ever got any work done in those dresses that dragged the floor—or the barnyard when they went out to feed the pigs. You were just no gentleman if you even risked one eye when a lady showed an ankle under one of those long dresses as she climbed over the buggy wheel.

Speaking of climbing, how those dresses climbed and climbed in the years that followed until they could climb no higher! You sure didn't have to risk straining an eye to see the ankles then! Then the skirts started down again with the "new look," and now are on their way up again.

As a boy, I remember being intrigued when my pretty cousin came to visit and I overheard Mother scolding her because she used the bedpost to pull the corset strings so tight that she could hardly breathe. It was fashionable then to be wasp-waisted.

Which reminds me about someone asking an old fellow if he remembered the wasp waist, to which he replied:

"Gosh, yes! That's when I got stung!"

Maybe some of you men are smarter than I am and can explain what corset covers were and why they were used. I guess they were in the class with a lot of other mysterious things that used to hang on the clothesline when I was a boy.

Leafing over the pages of the old catalogs I came to the bathing suits. Gee, but were they something! They were so heavy, I don't know how the gals ever did any swimming in them. As far as my experience goes they didn't; they just waded in a little way and squealed. But now, oh brother, times have surely changed!

Yes, women are certainly queer critters, but interesting, maybe because there's no predicting what they will wear next—if anything.

But before you old boys start reading this out loud to your wives, you'd better look at the beam in your own eye. Remember those collars we used to wear, so high that you had to get a stepladder to get out of them to spit? Then came the celluloid collars, and weren't they something! One collar would last five years if you remembered—which you usually didn't—to wash it once in a while.

Young fellers never were really dressed to kill back at the turn of the century unless they wore gay elastics on their arms. The excuse was to hold the shirt sleeves back, but the real reason was to dazzle your sweetheart when you took the coat off.

Don't go laughing at the women, either, if you were among those who wore high buttoned shoes and even carried a buttonhook with a folding handle so it would fit in your pocket. You wouldn't be seen at a dog fight with a pair of those shoes now, but there was a time when you took care to let everybody know you were wearing them.

Remember your first derby? I saw one coming down the street the other day and it actually made me homesick. But, honest now, was there ever any hat that women wore that could beat the absurdity and the discomfort of the brown derby?

But with it all, it was fun to get those clothes all on, including a heavy woolen suit, in the good old summer time and take your girl to the fair. What a relief it was though to get back home again, doff those go-to-meeting clothes, get on the old overalls, and go out and milk the cows! It's interesting to turn back the clock forty or fifty years and see how queer and funny we looked. But don't forget that with all our modern smartness we'll seem just as queer and funny to those who walk the earth half a century hence.

YOU NEED "GREEN FINGERS"

NOTHING gives me more of the feeling that spring is on its way than to see some tomato or other plants shoving up out of the dirt in a window box. It's a lot of fun and saves some money to grow your garden plants—or some of them—in the house, but you need green fingers to get the sturdy, healthy plants that you can buy from a greenhouse.

For some hints on how to get good plants turn to Page 15.

EASTMAN'S CHESTNUT

DID you hear that story about the Englishman who bought a highly bred wolfhound so that he could make money by killing wolves for the bounty? When the dog came, the Englishman invited some dyed-in-the-wool Texans to see the first chase. Before long a wolf was sighted, the dog was freed from his leash, and the chase was on, but though the party wandered mile after mile they found no trace of either the dog or the wolf. Finally, they reached a clearing where a man was chopping wood, and the Britisher cried:

"I say, old chap, did you see a wolf and a hound pass by here?"

"Sure did. They just passed."

"And how was the race?"

"Pretty hot, stranger. But the dog was a little bit ahead!"

AA's Farmers' Dollar Guide

MILK: Some time soon, dairymen in Metropolitan Milk Shed will vote "yes" or "no" on new Class I-A price formula. Formula is essentially the one recommended by the committee headed by Dr. F. F. Hill of Cornell and appointed by Administrator Blanford. While it is agreed that no formula will ever be perfect it is felt that the new formula is an improvement and that dairymen should and will vote for it. The vote will be completed by February 23. Some co-operatives will vote as a unit. Some dairymen will receive individual ballots.

The formula has a base price of \$5.66, which is the 1948 average Class I-A price. The formula will change the base price according to three factors: the general price level as shown by the U. S. wholesale commodity price index; changes in supply and demand as indicated by the percentage of all milk used as fluid milk, and a seasonal price change designed to encourage more even production throughout the year.

However, the formula will not become fully effective until August 1, since a minimum Class I-A schedule of prices has been set up as follows: March, \$4.80; April, \$4.58; May, \$4.36; June, \$4.14; and July, \$4.58. The price in these months will be above the minimum if the Boston Class I price, except for seasonal changes, is higher.

Establishing these low prices will mean several million dollars to dairymen between now and August 1st. The floors will serve to ease the transition from the present situation to full use of the new formula on August 1st.

PRICE LEVELS: Since the peak, prices received by farmers have fallen 23% while prices of things they buy have dropped only 3.6%. In '49 alone, prices farmers received dropped 12%. Most economists believe that farm prices will continue to slide downward, but not as rapidly. Costs of farm supplies may drop some but less rapidly than farm prices.

Only way that individual farmers can maintain returns at last year's level is to cut production costs by such tactics as making full use of machinery; discontinuing unprofitable crops and livestock; pushing up production per animal or per acre; feeding efficiently; cutting the amount of labor and, in fact, trying in every way to increase production per hour of work.

POTATO SUPPORTS: The potato price supports for the coming year will be about 15¢ a cwt. below last year; in late areas, varying from about \$1.35 to \$1.85 per cwt. by months. Only those areas which vote marketing agreements will get supports.

OLEO: At this writing, Congress has not passed the oleo bill. It is generally agreed that differences in the House and Senate bills will be ironed out; that the bill will be passed and signed, and that it will contain relatively few safeguards for butter. Undoubtedly, the bill will have a bad effect on dairy industry.

Work is under way to make a frozen milk concentrate, similar to frozen orange juice, to which water could be added to make a product close to fresh fluid milk. Also, there is some sentiment for a federal law to set health standards for milk in interstate commerce, with the assumption that any dairy that met those laws could ship milk to any state. If all these things come to pass, a big shift in dairying may result.

GUIDE POSTS: Some years ago the National Grange set up three Guide Posts. They are worth study by every citizen. You may be assured that any scheme that does not square up with these three Guide Posts is unsound. Here they are:

1. All prosperity springs from the production of wealth; anything which retards the production of wealth is unsound.
2. The compensation of each should be based on what he contributes to the general welfare.
3. The prime purpose of government is to protect its citizens from aggression—both physical and economic.

The Song of the Lazy Farmer

IT'S COMICAL as it can be the way Mirandy works on me to be like more ambitious men and work a little now and then. You'd think that after all these years of pleading, storming, threats and tears, she'd know it is a hopeless task and wouldn't waste the time to ask. But she has got a stubborn pride, and the 'most ev'rything's been tried, she keeps on looking for a scheme that might make true her fondest dream. She lives on hope that some fine day she can face all her friends and say: "My husband would be hard to beat; why, he would rather work than eat!" She's always looking high and low for women folks who claim to know just how to make a husband jump and spend less time upon his rump. When she returns from town or club, I know there'll be some more hubbub while she tries out a new idea that she's been told might work on me. One time she may sit on my lap and use sweet words to bait her trap; or she might storm into the house and scream that I'm some kind of louse. I really find it lots of fun, especially since I've always won; I'm proud that I've successfully matched all those female wits, by gee.

February Farm Bulletin

This Month:

1. An all-year-round truck tire that's worth knowing about.
2. Longer life for your rear tractor tires.
3. A thought before spring plowing time.
4. Remedy for hard starting.

1. An all-year-round truck tire that's worth knowing about.

Tires on farm trucks take a beating in any weather—Gulf's new All-Service Tire, built in small and large truck sizes, is designed especially to stand up under the tough punishment your farm truck takes. It has *traction-plus*. Its high, open-slotted shoulders, with cross-the-tread cleats, are deep and sharply edged for extra pulling in muddy and snow clogged roads, or across open fields. The tread is much deeper, much wider and heavier than passenger tire treads, for long, economical wear-life.

Gulf All-Service Tires are fortified against bruising and snagging, contain 6 full plies, and are built with a new, more efficient rayon cord that's 60% stronger than ordinary cords. Double breakers, too! Ask your Gulf dealer about Gulf All-Service Tires.

2. Longer life for your rear tractor tires.

Reliable field tests show that liquid-weighted tires last a good deal longer if some space is left for air pressure.

A good rule to follow: Fill only to the upper valve level when liquid-weighting your tractor tires. Then the remaining air acts as a shock absorber to protect your casings.

For more information on liquid-weighting, see page 39 of the Gulf Farm Tractor Guide.

3. A thought before spring plowing time.

There's been a lot of talk in the farm papers about the special open-center type of tread of the Gulf Rear Tractor Tire.

Seems farmers are amazed at the way this high-cleated tread penetrates the soil—even bites right through sod. That means better traction—more pull at the draw-bar.

These rugged tires will help you get more work out of your tractor.

Stop in at your Gulf dealer's and have him show you the whole family of Gulf Tractor and Farm Implement Tires.

4. Remedy for hard starting.

If you're having starting troubles these cold mornings, you might check the spark plugs. Too-wide gaps make hard starting.

And if the battery is weak, don't take a chance on it. Get yourself a new Gulf battery so you'll have plenty of starting power from now on.

Why not stop in at your Gulf dealer's, next time you're in town?

GULF

Farm Aids

Sez Zeke: "I'm proud of my family as we walk along Main
All dressed like a million—thanks to BLENN on my grain!"

New Process
Blenn
Swift's
Specialized Crop Maker

Zeke likes to live in style. He knows that BLENN, Swift's specialized crop maker, helps make him the needed cash. There is no doubt that this superior plant food does earn extra money for growers of corn and other grains. A normal application means an investment of \$4 to \$5 an acre . . . but the increased yield New Process BLENN can give makes it a mighty profitable investment. This modern plant food actually lowers the cost of production per bushel. It helps to grow more from each acre you plant.

One thing that makes modern BLENN a better plant food is the new process used to manufacture it. Developed by Swift, this *exclusive* manufacturing method gives BLENN exceptional uniformity. First, complete mechanical mixing—then, complete chemical processing.

Like all Swift's Plant Foods, BLENN is now more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform freedom from caking, lumping, bridging; 3) uniform distribution through your machines; 4) uniform feeding of your crop throughout the entire season.

Use BLENN as a growth-promoting food for your grain. You'll get bigger yields, better crops. Order all you need of this modern plant food right away. See your Authorized Swift Agent about BLENN today!

SWIFT & COMPANY

Plant Food Division
Chicago 9, Ill.

Buy at the sign of the RED STEER

A Good Steer

Never make the mistake of thinking that a good commercial plant food, like BLENN, can do the *whole* job of increasing your crop yields. You also need a good soil management program. That calls for lime where needed—good rotations that include a legume—erosion control—good seed—drainage, if necessary, and good tillage. Remember to plow under barnyard manures and green manures.

* * *

America's greatest crop is probably our most neglected crop. We do mean *pasture* grass. It's relatively easy to turn a fair to poor pasture into a good one. Try an application of BLENN and watch for results.

Just listen to some of the results others are getting with BLENN.

"In 15 years of farming I have used many plant foods. Last year I found the answer to my plant food 'wants' . . . Swift's BLENN increased my yields by 10% per acre. Such an increase is high, as I have always followed good cultural practices. It's proof to me that BLENN is a superior plant food for grain."

Leon Hill, Sandy Lake, Pa.

* * *

FREE! We will gladly send you a 16-page booklet that gives the facts about BLENN. It's a real opportunity to cash in on the experience others have had with this specialized crop-maker. Write to Plant Food Division, Swift & Company, Chicago 9, Ill., and ask for it.

Some Advantages of GRASS SILAGE

THE NORTHEAST is a grass country. In spite of the impressive figures showing production of cash crops, fruits and vegetables, the crop which occupies the biggest area is grass in the form of meadows and pastures. One reason why the Northeast is a land of grass is that we have the rainfall.

For many years farmers have been advised to cut their hay early in order to improve its quality, and for just as many years the weather has interfered with men's plans, not only preventing harvest in some fields but ruining the quality of many fields after they have been cut.

Putting up and feeding grass silage, a practice which has been developed rapidly in the last few years, is the best way so far devised for permitting the early harvest of grass when its quality is highest and preserving it with the smallest amount of losses. Here are some of the reasons for that statement:

1 Grass for silage can be harvested at its best stage.

Harvesting and cutting of grass into the silo can even, in a pinch, be done when it is raining. It is neither necessary to wait for drying weather nor to stop when the weather threatens. Grass before it becomes mature is high in protein; it is palatable and highly digestible.

2 Putting grass in the silo cuts down on waste.

There is a lot of waste in putting up dry hay and it comes principally in two ways: first, there is a loss in quality which results when hay gets wet after it is cut. In many cases where it is wet several times, the end product is a poor quality of bedding. The second place where waste is heavy is in shattering of dry leaves. Leaves, of course, are most highly digestible and are highest in protein. Where this loss of leaves progresses to the point where the hay is mostly stems, the value of the hay is largely lost. Putting grass in the silo avoids this loss to a very high degree.

3 Grass silage helps to distribute labor throughout the season.

Most dairymen wish to have some dry hay. Where part of the crop is put into the silo it is possible to get that part of the work done early. Later in the season dry hay can be made, but even then, if it is not too late, rainy weather does not result in a stoppage of the job. When the weather is wet the grass can still go in the silo.

During the dry, hot months of July and August some of this grass silage can be fed, thereby making it unnecessary to grow emergency pasture crops, and later in the fall the silos can be refilled with corn silage.

4 Grass silage helps summer pasture.

Where a field of grass and clover is cut early and put into the silo, that field still has time to recover and make a good growth before dry, hot weather comes in mid-summer. Many times this growth is ready for pasture just at the time when permanent pastures are on the down grade.

Grass silage has other advantages which are worth thinking about. For example, no one yet has found a better means of preventing erosion than to keep a field in grass.

In general, farmers have found that adopting grassland farming (and this usually means some grass silage) increases the livestock carrying capacity

of the farm. The question then arises as to how the farm set-up should be changed to take advantage of this. The answer will depend entirely on the individual circumstances on the farm; but there are several possibilities. One, of course, is to keep more cows. This is likely to be the solution if barn room is available. If it isn't, some dairymen will hesitate about building and enlarging their stables. In such cases the answer, in areas where corn can be grown for grain, is likely to be an increase in this crop, thereby cutting down the amount of purchased feed.

This permits flexibility. If hay happens to be short and pastures dry so that a considerable amount of grass silage is fed out during the summer, it is a simple matter to put some of the corn intended for grain into the silo, or if there is no need for corn silage, it is just allowed to mature and is husked.—H. L. Cosline.

—A.A.—

GROWING POTATOES

PROFESSOR A. J. PRATT, vegetable crops specialist, Cornell, in his recent 4-H bulletin on potato growing says:

"Most things that make the crop big make potatoes good. The following are 'musts' in a first-rate potato project: (1) Disease-free seed of a blight-immune variety; (2) Plenty of seed, from 25 to 30 bushels to the acre; (3) Seed that has short, thick, green sprouts at planting time; (4) Good soil with an acidity of about pH 5.0; (5) Plenty of fertilizer, at least one ton of 4-8-10 or 5-10-10 to the acre; (6) Half the fertilizer plowed under and the other half put in bands, near the row; (7) Good weed control; (8) Thorough insect control with DDT; and (9) Care in digging and handling the potatoes."

—A.A.—

SIDE-DRESSING VEGETABLE CROPS

According to C. H. Nissley, vegetable extension specialist of the New Jersey Experiment Station, practically all vegetable crops respond to a sidedressing of a complete fertilizer after they have attained full growth and when the plants are maturing their fruit. This, he says, is especially true of melons and cucumbers, which respond to an extra application of complete fertilizer after the vines reach a length of 24 inches or more. The amount to use will depend on the fertility of the soil and the previous applications of fertilizer . . . A sidedressing should not be made unless the plants indicate a need for it. Let your plants be your guide.

"Well, another minute and we'll find out if that little old nerve is still alive and kicking!"

From the A. A. MAILBAG

Readers Grow Corn for Grain

IN A RECENT editorial titled, "Can We Grow Corn for Grain in the Northeast?" Editor Ed Eastman confessed that he couldn't remember what the old-timers called the selected ears braided into a string to save for seed. Now he has a wide choice of names sent in by readers from Maine to Pennsylvania. Some of the letters on corn for grain are reprinted below. You can read 'em and decide for yourself whether the seed braided and saved was called risk, wrist, rusk, hank, braick, braid, trace, switch or, string!

* * *

Grows Own Scratch

REGARDING your editorial, "Can We Grow Corn For Grain in the Northeast?", I find that it is nice to have a crib of corn after the silo has been filled, in our case anyway, as we have about 500 laying hens and it serves as scratch grain.

You should remember what they called the seed, as I am only 57 and traced a lot of seed a few years back. You call those bundles of seed corn traces or rusks.—W. W. Feelin, Blossvale, N. Y.

* * *

Old Husking Bees

YOU ASKED the name the ol' fellows called braick of corn. I believe the name was wrist of corn and was also called a hank, string, braick or braid of corn.

I hope you will open up and tell the readers how the Old Timers would try to grow the longest ears and also something about the old time husking bees.—Joseph J. Cashin, Moravia, N. Y.

* * *

A Dual-Purpose Crop

YOU HAVE invited discussion in *American Agriculturist* on growing ear corn in the Northeast. You are to be congratulated in picking out one of the recent developments which needs airing, with the breezes coming from both sides.

When the white men who visited the cornbelt were called explorers and it was still a grassy plain inhabited by wild animals and Indians, the Northeast was growing corn.

Our direct costs are a little more in the Northeast in terms of man hours per acre, but our land is worth less than cornbelt land and thus carries lower fixed charges.

Our yields come surprisingly close to cornbelt averages. In some northeastern areas, such as central Jersey and parts of South-eastern Pennsylvania, average yields are fully equal to those of the mid-West. Production of 75 bu. of dry shelled corn to the acre, even in New York State, is commonplace and goes unnoticed.

Here we have a considerable choice of adapted hybrids and all the power equipment available to other regions. The almost universal northeastern practice of growing corn upon manured sod is apparently providing us an advantage in protein content. Preliminary evidence shows that our advantage runs from 10% to 20% more protein than carried by shipped-in corn.

To move a ton of corn from the Midwest farm where grown to the Northeast farm where fed is now estimated to cost less than \$25. Of this sum, \$13 is required for several forms of transportation. The balance can be account-

ed for in shelling, cleaning, drying when necessary, storage, shrink, insurance, bags and bagging and several handlings along the line. Our slightly higher direct costs do not approach \$25 a ton.

To me, corn in the Northeast is always a dual purpose crop—good for silage and good for grain. More and more we look to the same field for both. Corn picking machines are available for custom work and they become more numerous each year.—T. E. Milliman, Ithaca, N. Y.

P. S. In Monroe Co., N. Y., I've been growing ear corn for 12 years.

* * *

In Maine, It's "Trace"

I WAS born on a farm in Hartford, Maine, in 1888, from which my folks moved when I was 13. I am now a retail grain dealer in Canton where I have been situated for 31 years.

I notice you ask on your editorial page about what they used to call the strings of corn. I remember here in Maine they called them traces of corn.

I enjoy your editorial page very much. I also have your books "Growing up in The Horse and Buggy Days" and "Tough Sod." They are splendid.—Edward L. Goding, Canton, Me.

* * *

Risking Flint Corn

IN A RECENT issue of A. A. you had an editorial about flint corn for husking in the Northeast, and you said you couldn't recall what the seed corn was called.

They were risks of seed corn. I have been risking some flint seed corn today. I never could do as nice a job as did my father and grandfather. It requires quite a little good judgment to select the ears, leave just the right amount of husk, and successfully braid a risk of corn.

I think the main reason the older farmers here don't raise flint husking corn is that it is somewhat difficult to get a mechanical corn picker. Hard to get anyone to cut and shock corn the old-fashioned way—to lift such heavy shocks on and off the wagon—and they think one is not "finished off in the belfry" if they are asked to husk corn.—Arthur G. Luke, Amsterdam, N. Y.

* * *

New Varieties Better

YES, GOOD corn can be grown in the Northeast. We have grown corn on this farm for the last 13 years and had good corn most of the time. However, to get good corn we must have the right seed and the right cultivation. Canadian Flint corn has been grown here for many years, but it is not suited to machine harvesting for many of the ears are too low. The Maine B is a newer corn and a much better corn that usually ripens here.

We have found that Jacques' 802 is the best corn for us. It works well in machine harvesting and usually gives a good yield of good hard corn. However, it must be planted as early as possible and harvested as late as possible. Some of our seasons are damp at harvesting time so the ears are not as dry as desired to keep well. In any event the crib must be well designed. It should be as well ventilated as possible. Our biggest problem is to keep the corn from molding.—A. L. Fitch, New Sharon, Me.

for BIGGER CROPS ahead

USE THIS CULTIVATOR *behind!*

The forward-looking farmer . . . cultivating with a Ford Tractor equipped with a Dearborn Rear Attached Cultivator is sure of a clean crop. This cultivator follows the tractor accurately. There's no neck-tiring watching of gangs down under you. Your eyes are well ahead, just as in plowing, planting or mowing.

You get a better cultivator for less money because the Ford Tractor's Triple Quick-Attaching replaces bolts and nuts for mounting; and Ford Tractor built-in Hydraulic Touch Control replaces levers and springs on the cultivator. For fast, effective killing of weeds to increase your yields and profits, ask your Ford Tractor dealer to demonstrate this equipment.

DEARBORN MOTORS CORPORATION • DETROIT 3, MICHIGAN

Dearborn Rear Attached Cultivator

This cultivator comes with either rigid or spring shanks. Spacing is easily adjusted for two rows of corn, cotton, tobacco, etc., and many vegetable crops. One-minute attaching and detaching save time when time means money.

See your Ford Tractor
dealer now . . .

GET A DEMONSTRATION . . .

Try this type of cultivation. Your nearby Ford Tractor dealer will gladly demonstrate the Ford Tractor and Dearborn Rear Attached Cultivator; then, judge for yourself. See or phone him now.

Dearborn Rigid Shank Cultivator, companion to the Spring Shank Cultivator in large picture. A favorite wherever a Rigid Shank Cultivator is preferred.

Ford Farming MEANS LESS WORK . . .
MORE INCOME PER ACRE

MONEY-BACK GUARANTEE on Peebles' KAF-KIT

We guarantee you complete satisfaction with the feeding results of Peebles' KAF-KIT when fed to your calves as directed. Feed KAF-KIT for 7 weeks. If you are not convinced that the KAF-KIT program raises better calves than any similar program, give your dealer a written statement as to why you are not satisfied. He will cheerfully refund the full purchase price of the Peebles' KAF-KIT used by you during this feeding test.

WESTERN CONDENSING CO. Appleton, Wis. San Francisco, Calif.

Peebles' KAF-KIT Must do a Job for You or it Costs You Nothing!

Now you can raise big, husky "milk-fed" calves on practically no whole milk. You can cut calf-feeding costs 1/3 or more—save 250-500 lbs. of milk per calf. Peebles' KAF-KIT replaces milk safely because it's made from milk—98% milk serum solids plus guaranteed available amounts of Vitamins A, D and Riboflavin. That's why KAF-KIT raises calves with real milk-fed "bloom" and vitality. It's easy to feed. It remains in suspension during feeding.

See your KAF-KIT dealer now. We're so confident that KAF-KIT will develop the finest calves you've ever raised that we want you to try it at our risk. Feed KAF-KIT as directed for 7 weeks. If you are not completely satisfied with the feeding results, your money will be refunded. This offer is good on all KAF-KIT purchased before May 1, 1950. Don't delay! Order your KAF-KIT now.

KAF-KIT did a job for these Farmers and it can do a Job for you

"At 4 months, KAF-KIT raised calf is as big as 6 month old calf on another replacement."
D. E. Santore,
Danbury, Conn.

"I have raised 18 calves on Peebles' KAF-KIT. I like it because it seems to eliminate scours."
W. M. Church,
Auburn, N. Y.

98%

MILK SERUM SOLIDS plus guaranteed available amounts of Vitamins A, D and Riboflavin.

PRE-FRESHENING BUILD-UP at New Low Cost

Of all times in the cow's cycle, calving time bears down with severe demands on bodily vigor and stamina. And the new Jumbo Drum of Kow-Kare now brings amazingly low-cost to a famous build-up program. Valuable Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D promote appetite and digestion, provide necessary mineral and vitamin replacements, bring added vigor when stamina is needed most.

Remember this... ANY size of Kow-Kare is an investment, not an expense, but the new bulk Drum brings the cost down from 49¢ to 33¢ a pound. There now can be no question of the wisdom of Kow-Kare pre-conditioning of all freshening cows for at least a month. With normal cows under stress of heavy feeding, a one-week-a-month Kow-Kare schedule usually is enough. Your dealer has OR WILL QUICKLY GET the new Drum; or if your herd is small, there's a smaller size Kow-Kare to fit your need.

HARRIS SEEDS NORTH STAR IS A MONEY-MAKER

Everyone knows that good early corn brings premium prices. That's why each year more growers are planting North Star. Not only is it early (67 days from planting to picking), but it has excellent quality, attractive appearance and yields abundantly. The vigorous seed may be planted in cold soil and the husky plants stand up well under adverse growing conditions.

Harris' Hybrid Sweet Corn, North Star

Controlled Stable Temperature Means More Milk

By CHESTER DALRYMPLE

AN automatic power shutter is one of the latest mechanical "farm hands" that has been developed to improve farming conditions. It's another step towards "perfect" stable ventilation for dairy-men and was devised by William F. Millier for the New York Farm Electrification Council, which is headed by Prof. C. N. Turner of Cornell University.

"The new automatic power shutter is the best answer to the small dairyman's needs for temperature control in the stable," states Professor Turner. When fans were first used, they were selected for 60 c.f.m. (cubic feet of air per minute) for each cow as the best

opens, allowing the fan to draw air at 100 c.f.m. from the ceiling, removing the hottest, most moisture-laden air from the stable. After the temperature falls below the thermostat setting, the device closes the shutter and the fan starts drawing from the floor at 40 c.f.m. again.

For herds of about 35 cows or more, Professor Turner recommends two fans, one in a duct drawing continuously from the floor at 40 c.f.m. and the other, controlled by a thermostat, drawing from the ceiling at 60 c.f.m. This gives a total of 100 c.f.m. when the temperature reaches the thermostat setting and the top fan comes on.

The other half of the story, intakes, is also important. The Cornell engineer recommends the conventional Fairbanks-Goodman box-type inlets which take air either from outdoors or the hay mow. The advantage of taking it from the mow is that the air is warmer than the outside air, which allows more to be drawn into the stable, thus absorbing more moisture, without lowering the temperature too much.

A recent development by Millier, a former research engineer at Cornell, is the slot intake. This consists of a one-inch slot around the barn between the wall and the mow floor through which the air from the mow is drawn into the stable.

Initially in a new barn there would be practically no cost of construction, and it would take two men less than a day to cut the slot in old barns. The air coming from the mow is tempered, and coming through the slots it blankets the stable walls which acts as insulation and reduces heat loss, besides keeping the stables completely free of condensation.

Professor Turner advises farmers to work out the best arrangement with their district engineer for their barn. It might be powered shutter and slot intake, or two fans and box intakes. Whichever it is, it will be the best method yet developed for ending ventilation problems. Besides, working conditions will be better, rotting of barns will be stopped, losses from wet hay in the mow will be eliminated, and, most important, milk production will increase.

The 52 stanchion barn of Clifford Schutt in Dryden, N. Y., has had a slot type intake and fan outtake for over a year with good success. Three fans are used due to the limited space between the stanchions, but the amount of air, the important thing, is the same, 40 cubic feet per minute from the floor and 60 c.f.m. from the ceiling. Despite wide fluctuation in outdoor temperatures, Mr. Schutt found that his stable temperature remained close to 52 degrees.

average delivery. But at cold temperatures this was too much air, while during the warm spells it wasn't half enough, and fluctuating temperatures cut into milk production. With the power shutter this trouble is eliminated.

The recommended arrangement is first to plan on 100 c.f.m. per 1,000 pounds of cow in an adequately insulated barn of at least two one inch boards with paper between. Next, install the fan near the ceiling in the wall of the barn, enclosed in a duct that leads to the floor. The duct cuts down the fan's capacity to 40 c.f.m., Turner explains—a big advantage to the farmer since the duct only has to be half as wide as is usually built and takes up that much less of the feed alley. At the top of the duct, opposite the fan, the automatic powered shutter is installed. This is operated by a device which is controlled by a thermostat.

With this set-up a farmer can be sure that whatever the outside temperature, his stable temperature will be right around 50 degrees, which has been found to be the best temperature for maximum milk production. The fan runs continuously, exhausting cool air at 40 c.f.m. from the floor or warm air from the ceiling at 100 c.f.m.

This is extremely important since cows continuously produce moisture that must be eliminated, as otherwise it collects in the hay mow and rots the building. When the temperature rises to the thermostat setting, the shutter

SLOT INTAKE FROM HAY MOW

A schematic drawing shows the simple operation of the slot type intake for stables. The air in the mow, warmer than the outside air, is drawn through the one inch slot between the mow floor and the wall down along the stable.

New York's champion fox trappers, concluding their 1949 season at a banquet and achievement program in Ithaca, inspect one of the prize winning pelts.

From left to right: Karl Chasey of Castile, Wyoming County, who placed first with a total catch of 42 foxes; second with 38, Gordon Schuknecht of Fillmore, Allegany County; tied for third with 37 foxes apiece were the next two boys, Melvin Vannote of Gowanda, Erie County, and Richard Tarey of Castile, Wyoming County.

Boys and Girls Trap 1511 Foxes

ON FRIDAY, February 3, winners in county fox trapping contests from 25 counties were entertained at a banquet in Bibbins Hall in Ithaca. This annual fox trapping contest, which is open to boys and girls over the State, is jointly sponsored by the New York State Farm Bureau Federation, the State Poultry Council, the Extension Department at the State College, and the *American Agriculturist*. The purpose of the contest is to teach boys and girls the proper methods of trapping and, along with it, to teach them many things about conservation. 1,108 boys and girls entered the contest and accounted for 1,511 foxes.

The State winner this year is Karl Chasey of Castile, Wyoming Co., who caught 42 foxes. Second prize went to Gordon Schuknecht, Fillmore, (Allegany) with 38 foxes. Tied for third were Melvin Vannote, Gowanda (Erie) and Richard Tarey, Castile (Wyoming) with 37 foxes apiece. Fifth was George Reinhardt, Chaffee (Erie) with 36 fox-

es; sixth, Clayton Errington, West Falls (Erie) with 28; seventh, Henry Miller, Naples (Ontario) with 25.

At the banquet honoring the winners, H. L. Cosline, associate editor of *American Agriculturist*, was toastmaster. Commissioner Perry Duryea of the State Conservation Department presented prizes to the two top winners.

In addition to prizes for the most foxes caught, prizes were offered for the best prepared pelts. In this group first prize went to Norman Baker, Warsaw, (Wyoming). The other six top winners in pelt preparation were: 2nd, Douglas Weaver, Hudson, (Columbia); 3rd, Donald Blair, Town Line (Erie); 4th, Robert Lopp, Alexander (Genesee); 5th, Edgar VanVorhis, Jr., Hyndsville (Schoharie); 6th, Gaius Becker, Brocton (Chautauqua); 7th, Richard Wood, East Nassau (Rensselaer).

First prize for pelt preparation was a fishing rod, reel, line and hooks, and first prize in the fox trapping contest was an Ithaca shot gun.

The contest will be continued another year and it is expected that an even larger number of boys and girls may participate in it.

— A. A. —

MAPLE SUGAR PUBLICITY

The Maple Producers Cooperative Association, Inc., with headquarters at Gouverneur (St. Lawrence Co.) N. Y., is making plans to promote New York maple sugar products. This cooperative, which was organized in 1922, has about 450 members which, of course, is just a drop in the bucket so far as maple producers in the Northeast are concerned. However, it is a good start as pointed out by Manager Howard Patton and secretary-treasurer John Sipher.

Among the steps already planned is to set up an exhibit in the New York Central Railroad Station at Watertown plus a move to get New York State maple syrup used on New York Central Diners.

The next step is a meeting at Albany with representatives of the Department of Commerce and the State Bureau of Publicity to discuss plans for publicity for New York State maple products.

Eleven-year-old Sylvia Diedrich of Fairport, Monroe County, who took 11th place in the 1949 New York State fox trapping championship with a catch of 15 animals, poses with the prize-winning pelt which was entered by Norman Baker of Warsaw, Wyoming County. More than 1,000 trappers from 25 counties took part in the 1949 contest.

MINRALTONE HELPS BUILD CHAMPIONS

Here's a group of daughters of Good Acres Advancer, Approved. Good Acres' outstanding herd of Ayrshires is noted for its uniform good health and high production. They're MinRaltone fed.

Good Acres' Outstanding Herd Protected Against

HIDDEN HUNGER*

Good Acres, a 1000 acre farm at Waynesboro, Pa. boasts 250 head of fine Ayrshires. The herd's excellence is widely known — and judging from the photograph above, it will continue to produce standout Ayrshires.

Mr. D. W. Good is owner of Good Acres; Franklin C. Goshorn the Manager, and Charles A. Wagner the Herdsman. According to these men — "We've been feeding MinRaltone at Good Acres for five years, premixing it, and allowing the herd free access to it. We find MinRaltone helps keep our herd in top notch condition."

What MinRaltone will do for one breed, it will do for all. Follow the lead of successful dairymen — feed MinRaltone to your herd. MinRaltone protects against Hidden Hunger* because it contains 11 essential mineral elements with Vitamin D. Write for free MinRaltone feeding booklet and complete details.

"The best treatment for mastitis* I've ever used!"

says
E. J. Lubeck
of
**Milton Junction,
Wisc.**

"We spent a lot of money trying to keep mastitis out of our herd of 27 Holsteins. We tried most of the mastitis treatments and nothing seemed to work.

"Then I read about Squibb's Penicillin Ointment. I went to my druggist, bought my first tube and used it. *I have not been without it since.*

"This Penicillin Ointment is the best treatment I've ever used. It has given us remarkable results and saved us real money. Now we expect to continue getting full production of milk and cream from clean, healthy cows.

"We especially like the shape and style of the tube. It is fine. Cows do not seem to object and the thin taper makes it mighty easy to insert in the quarter. The ointment comes out easily, too, so it only takes a few seconds to treat a quarter.

"Whenever there is the least sign of mastitis in our herd, we treat the cow then and there, as we keep Penicillin tubes in the barn all the time."

It's a good idea to do what Mr. Lubeck does: keep some Squibb Instant-use Penicillin *on hand* right in the barn, and treat mastitis early—as soon as it shows up.

Why not get a dozen tubes the next time you're in your drug store? They have it or can get it for you.

For accurate diagnosis of mastitis, consult your veterinarian.

For **SCOURS** in calves and other young animals—**PENOVXIL CAPSULES**. A specially prepared, exclusive Squibb formula—only product of its kind on market. Effective—easy to use—no drenches—no injections. If your druggist isn't supplied, write to E. R. Squibb & Sons, Veterinary and Animal Feeding Products Division, Dept. AA-2, 745 Fifth Avenue, New York. Literature on Penovoxil Capsules, Penicillin Ointment, and other Squibb specialties, available on request. Just drop us a postcard for yours.

*Due to *Streptococcus agalactiae*, the cause of the largest percentage of all mastitis cases.

SQUIBB —A NAME YOU CAN TRUST

A "Self-Feeding" Barn

SOMETHING new in barn construction is being tried on the farm of Paul Mazur at Fiddler's Creek, N. J.

In fact, the barn consists of two quonsets, one inside the other with a space between. Chopped hay is blown into the area between the inner and outer barn, and the grass falls down into the space at the bottom on each side as the animals eat it. In other words, it is termed a self-feeding barn, and the work of feeding the animals is referred to by Mr. Mazur as 'steer' hours as compared to 'man' hours required to feed animals in a conventional barn.

This method is suited only to pen stabling. On the Mazur farm, beef cattle are being housed, but it would

be equally applicable to dairy cows kept in the pen stable.

The picture above shows beef steers feeding. The drawing below will give you an idea of how the barn looks.

In the drawing, the dotted line at 1 shows how a half quonset can be added as a shelter for farm tools. At 2 the pipe from the blower is delivering hay to the peak of the barn. At 3 the cut hay is falling between the two walls and at 4 the inside doors are raised so that the animals can eat the chopped hay from between the slats.

The New Jersey Agricultural Experiment Station at Rutgers is interested in this experiment. Two of the staff who have shown a great deal of interest are Dean Martin and Professor Bender.

Artificial Breeding Plus Good Herd Management Pay Off

(Continued from Page 3)

cows which show few, if any, outward signs of heat.

When a cow is to be bred, the inseminator is called promptly and is given all of the information necessary to time the breeding properly. In this regard, White believes that the training and experience of the inseminator make him best qualified to decide when the cow should be bred for best results, and he does not attempt to "out-guess" him. Occasional "problem cows" are examined by a veterinarian.

Fertilizer for More Roughage

The roughage program on this farm is outstanding and forms the basis for economical milk production. This good roughage, coupled with grain fed in accordance with production, keeps the herd in excellent condition and undoubtedly plays a major role in maintaining breeding efficiency.

Twelve years ago, the farm's seventy-five acres of crop land wouldn't cut enough hay to winter four cows and a team of horses. Today, the same acreage provides pasture, hay and silage for 58 head and, usually, a few tons of

surplus hay for sale.

During 1949, 32 tons of commercial fertilizer, more than 1,600 pounds per animal unit, were used in addition to manure. 37 tons of lime were applied to soils which required sweetening.

Rocky, thin soiled, rough pastures have been abandoned and the herd now grazes on crop land. Rye, oats, pre-grazed hayfields and clover aftermath are used to supplement thirty acres of ladino clover in providing an abundance of pasture.

Since the farm does not adapt itself to the growing of alfalfa, chief reliance for winter feeding is placed on early-cut mixed hay containing a high percentage of clover. The cows get all the good hay they will clean up in addition to corn silage.

The success of artificial breeding in Winthrop White's herd is a convincing demonstration of the value of close cooperation between farmer and inseminator. Accurate records take only a few minutes a day and, in view of the increased income which results from improved breeding efficiency, it would be hard to find a more profitable use for the dairyman's time.

GOT SILOS ON YOUR MIND?

Choosing the silo that's the best investment for you isn't easy. There is a difference in silos—that's why we manufacture four different varieties, the four proven types in wood and tile.

We'll help — by giving you all the facts, without pressure, prejudice or obligation. You'll be able to choose the silo that best fits your location, feeding program and pocketbook. We think you'll want a Craine. We're glad to help you, whether you buy from us or not. You can't lose on this offer!

the garage, the motor and hood are protected from any breezes sailing around. We don't have to hang a blanket over the hood; it's covered nicely by our piece of canvas. The motor starts at the first touch.

The interior of the garage is not lined and there are plenty of 2x4's. We nailed some boards from one to another, and in some spots placed nails. It's an ideal place to hang up our tools. The hoes, rakes, etc., are simply hung over the boards, and the shovels go on the nails. It makes us a tool house.

—Ted Townsend, Waterville, N. Y.

A BETTER CROWBAR

Here is a bar for driving post holes which is far better than a plain crowbar. I had it made by a local black-

smith. It is the same size as a crowbar except at the bottom which, as you can see, is considerably larger. If you couldn't get another, you wouldn't sell it for ten times the price it cost you.

—V. P. Aldrich, Fredonia, N. Y.

—A.A.—

DUSTING POTATOES

If you have a small patch of potatoes planted, a good method of dusting them is to put the dust in any ordinary burlap bag and shake the bag up and down over each plant. A surprisingly good uniform dusting job will result.

—Kenneth Gabrosek, Fly Creek, N. Y.

AN OLD BICYCLE WHEEL is used on the James C. Cooper farm at Marcellus, New York, to make the speed reduction necessary for a 1/2 h. p. motor to operate the cement mixer.

EASY

to handle
HINMAN'S
NEW *Jiffy*
MASTER MILKER

Grips arranged for easy handling—pail balances perfectly. Result: faster pouring, easier pouring—easier all-around handling without detaching cover from milker. If you prefer to switch pails in the barn ask to see our "California" Jiffy.

EASY TO CLEAN

Well rounded, stainless steel pail with wide opening—without seams or hidden openings—every part of your Hinman Jiffy Master Milker is accessible for easy cleaning. One glance inside pail shows you when it's clean, too—no flashlight or mirror needed.

EASY ON THE COW

Thanks to Hinman-originated 10 inch low-vacuum principle. Like a skillful hand-milker, the new magic hand inflations produce a gentle squeeze which starts at top and works downward. Demonstrations prove that even nervous cows respond to this soothing action.

For further information about this outstanding milker, write today for free folder, "Meet the Master Milker".

The Best Business in the World

Deserves the Best Financing in the World!

There is no better way to finance your farm than through cooperation with good farmers in your own community. The Cooperative Farm Credit system operates through local farm credit associations managed by directors elected from their farmer membership. These people know and understand local conditions, assuring you helpful counsel and service.

Federal Land Bank mortgage loans are offered by these associations at 4½% interest . . . a rate lower than most. Such loans can be written for 10 to 33 years, repayable in small, easy-to-carry installments. They carry no prepayment penalty and they never need to be renewed. Production loans are made on an equally favorable basis for shorter periods.

Whether you need a long-term mortgage, or short-term loan for operating expenses, take advantage of the best credit system in the world — one that is now serving many of the good farmers in your community and in every farm community from coast to coast.

FEDERAL LAND BANK LONG-TERM MORTGAGE LOANS through local National Farm Loan Associations. Repayment periods run from 10 to 33 years with low interest guaranteed for the life of the loan.

PRODUCTION CREDIT SHORT-TERM LOANS for periods up to 30 months and at low interest rates are available through the Production Credit Associations.

For your convenience, in most communities both National Farm Loan and Production Credit Associations share the same office.

New England's Agriculture Offers Happiness and Success

(Continued from Page 1)

given all too briefly, yet sufficient to show the picture of the healthy, prosperous condition of the agriculture of old New England:

First. How big is this agricultural business?

The farmers of New England have \$1,240,470,000 invested in lands, buildings, equipment, and livestock. The amount of cash receipts from the sale of their farm products in 1948 amounted to \$825,006,000. Dairy products led the procession with a value of \$224,028,000; followed by poultry, \$191,325,000; potatoes, \$121,485,000; and other commodities to the amount of \$288,168,000.

Dairy and Poultry Area

Reference has been made to the changes that have taken place in our agriculture. Let us examine some of them. In the last 50 years the dairy cow population in New Hampshire has decreased 48,000 head, yet the production per cow has steadily increased. The smaller herds have decreased and those of 20 milking cows and over have increased.

Look, if you will, at the poultry industry. The cash receipts from poultry alone now provide 41.4 per cent of the total that farmers of New Hampshire receive from the sale of their marketings annually. In 1924, the amount was \$6,099,000, and in 1948, \$28,671,000. In 1900, New Hampshire produced 7,000,000 dozen eggs; in 1947, 31,500,000 dozen, an increase of 350 per cent. In the meantime the progressive poultrymen of this state have developed a new breed—the New Hampshire—which is now the most numerous single breed in the United States. The poultry industry in New England is small in the number of layers on farms and in total egg production when compared with states like Iowa and Minnesota. Yet in cash receipts per bird from eggs produced, the New England states claim six out of the first seven places among our 48 states.

Caters to Many Markets

Now let us glance at market trends and opportunities. First let us recognize that improved transportation and land development in the West have brought greatly increased competition with our New England products. The reverse is also true. Maine potatoes find outlets in 27 or more big Eastern markets, and were on sale at Pacific Coast points this past year. Day-old chicks and breeding stock from New England are being shipped all over the United States and exported. Maine lobsters are being served in the restaurants of California. Cranberries from Cape Cod, blueberries from Maine and New Hampshire, tobacco from Connecticut, maple sugar and syrup from Vermont, all of these products and others are finding markets throughout the United States.

However, the markets for much of our produce are right here in the Northeast. There are over 20,000,000 people within 300 miles of Durham, New Hampshire. The income of those living in New England, New York, and New Jersey in 1946 was \$40,981,000, or 24 per cent of the total of the whole United States. Here within our reach, then, are to be found the best markets in the world.

More and more, our products are catering to the demand for high quality, specialized products adapted and packaged to consumer demand. New methods also are being used in marketing. Our wholesale and retail stores are cooperating with our research workers and producers in preserving the appearance and quality of our fruits and vegetables, milk and eggs, until they

reach the consumer. Our roadside markets are increasing direct sales from producer to consumer. Another interesting marketing development is the growing practice of encouraging the general public to come to the farm and harvest their own supply of apples, strawberries, raspberries, blueberries, and some vegetables. This plan can be increasingly used by the small producer near city populations.

Yes, it is true that the number of farms in New England has been decreasing. Is that a sign of decadent agriculture? Certainly not when the production from the remaining farms has been greater than it was when the number was twice as many. Many of those census farms have been consolidated with others. They have become efficient units. They produce more per acre. Our animal production per unit has increased though the numbers may have decreased in some instances. We have changed from an extensive type of farming to a more intensive type, and more profitable agriculture has resulted. True, we have here in the Northeast a lot of small family-size farms, if one can define a family-size farm. We have room for them, and we have room for the commercial farm.

That young men are interested in our agricultural opportunities is shown by some Federal Land Bank figures for the Northeast. In their 1949 study, 32 per cent of their new borrowers were under 40 years of age. This, coupled with the fact that many a young man is either financed by his father or in his father's name, indicates the confidence that young and old have in the agriculture of the Northeast.

Land of Modern Homes

Up to this point I have said nothing about the most important phase of farming in New England. In my opinion it is the farm home. I will leave to others the privilege of waxing eloquent about these tight, snug little farm homes so typical of New England. Let me give you some cold facts. In none of the other three geographical areas of the United States will you find as high a percentage of running water in the farm homes, as much electricity being used, nor as many telephones, radios, or automobiles. In New Hampshire 82 per cent of the farms have electricity, 62 per cent have phones, and 72 per cent have running water. The national averages are only 47, 31, and 28 per cent respectively.

In our New England farm homes are to be found most modern conveniences. refrigerators, freezers, electric stoves, washing machines, ironers, vacuum cleaners, running water, toilets and bathrooms, furnace heat, and nearness to all those desired privileges that are provided by the urban and city areas.

Land of Advantages

Not only has New England a great heritage but it contains all of those fundamentals essential to a future of prosperity and happiness. Situated on the Atlantic Coast, with its possibilities for export trade, its skilled labor, its agricultural possibilities enhanced by the new developments in machinery adapted to the small farm, these and many other facts promise much in the future development of this area. Here are the great vacation privileges of the Northeast; mountains of great beauty; thousands of lakes and streams.

All of these advantages and many others are all around us, available almost for the asking. Can one desire more opportunities for happiness and success than the conditions surrounding us in our everyday living here in New England?

Don't neglect SORE TEATS

Keep Cows milking...

protect them with

Dr. Naylor's

MEDICATED

Teat Dilators

Medicated surgical dressings for the teat canal. Contain Sulfathiazole. The medication is IN the Dilators. They perform three distinct functions:

1. Carry antiseptics into teat canal to help combat infection and reduce inflammation.
2. Furnish soft, absorbent protection to the delicate lining of teat canal.
3. Promote normal relaxation at end of teat by sustained antiseptic contact directly at site of trouble.

Dr. Naylor Dilators fit large or small teats. They have a smooth waxed end for easy insertion and stay in the teat.

EASY TO USE — Simply keep a Dr. Naylor Dilator in the teat between milkings until teat milks free by hand.

Question Box

Is it advisable to save snap bean seed from my own crop?

This practice is usually unsafe and undesirable. Nearly all of our snap bean varieties are susceptible to bacterial blight. Under our humid conditions the crop is very likely to be affected early in the season because of the blight carried over in the seed.

Most of our snap bean seed is grown in southern Idaho where conditions are too dry for the disease to multiply. Therefore, if one can be certain his seed grew there, he can be certain it is blight free. However, our difficulty is that some of our seed is grown in Colorado and Wyoming where blight is very prevalent.

I may add that it is possible but not practical to attempt to save seed from the home-grown crop, even though the pods appear to be quite free of the disease.—E. V. Hardenburg.

What causes new red raspberry canes to die at the tips in the spring?

The raspberry cane borer lays eggs in the tips of the canes. The eggs hatch and the worms burrow down in the canes. Cut them off below the worm and burn them.

I plan to have a garden on ground that was in grass last year. Can I grow strawberries successfully?

You are very likely to lose too many plants from white grubs. Strawberries seem to do better on old ground well supplied with humus.

I have a grape vine in my back yard. How much fertilizer should I use on it?

From a third to a half pound of a nitrogen carrier such as sulfate of ammonia or nitrate of soda. If these are not readily available, use a pound of 5-10-5 fertilizer. Apply evenly over an area several feet around the plant and put it on very early in the spring.

I would like to obtain information on the feeding value of beet pulp, corn silage and molasses, also, the recommended rate to feed these ingredients to dairy cows.

Beet pulp usually analyses 9.2% protein, .5% fat, and contains 1356 pounds of TDN per ton. It is considered a good feed ingredient, very palatable and slightly laxative.

Roughly, one pound of dried beet pulp is about equal to 3 pounds of corn silage. If allowed to soak up all the water it can, one pound of wet beet pulp will about equal one pound of silage in feeding value. Another comparison is that dried beet pulp is considered to have 90% of the feed value of corn and oats.

Since you have water bowls in the barn, you might be able to feed as much as 6 to 8 pounds of dried beet pulp per day, per cow, thus replace 18 to 24 pounds of silage. If they won't eat this readily, I'd suggest you soak it in water in the morning, to feed at night.

Molasses is a very economical feed ingredient and can safely be fed to the extent of 3 to 4 pounds per day. You can make molasses serve two purposes if you feed it on the hay. It will supply additional nutrients and make the cows consume more hay. By mixing a little warm water with it just before feeding, you can easily pour a small stream over the hay.

Some feeders short of silage are feeding as high as 4 pounds of molasses per cow per day on the hay, and get excellent results. If you can get molasses in an old milk can, and keep it in the basement of the barn, it is not so difficult to handle, especially if you mix some warm water with it just before feeding.—F. K. Naegely.

Safeguard Your Dairy Herd

with **SULMET***
SULFAMETHAZINE *Lederle*

Highly effective against Bacillary Enteritis
Calf Scours • Pneumonia • Metritis • Acute Mastitis
Shipping Fever • Foot Rot • Calf Diphtheria

One prompt treatment with SULMET Sulfamethazine *Lederle* frequently restores normal temperature and overcomes infection in an animal suffering from an acute bacterial disease. If necessary, successive treatments should be given once a day.

SULMET Sulfamethazine at recommended dosage is effective for 24 hours. Its fast action results in shortening the period of sickness and costly losses from prolonged illness are avoided. All things considered—low and infrequent dosage, rapid recovery, time and labor saved—SULMET Sulfamethazine is the most soundly economical of the miracle sulfas.

In addition to udder infusions of AUREOMYCIN Hydrochloride OINTMENT *Lederle*, cows suffering from acute, septic mastitis should be treated with SULMET Sulfamethazine, by injection or by mouth.

SULMET Sulfamethazine is available in several forms to suit your need: POWDER, TABLETS, OBLETS*, SOLUTION INJECTABLE Veterinary (available by or on a veterinarian's prescription) EMULSION, SOLUTION 12.5% (for use as a drench).

For maximum efficiency in the use of SULMET, as well as for best management practices and disease-control procedures, consult your veterinarian.

Read carefully the circular enclosed in the package for best results in the use of this product.

Free literature gladly sent upon request.

This home-made pruning platform saves time, keeps you out of snow or mud, and enables you to do a better job.

How to Build a Pruning Platform

By JESSE CLARK, Niagara County, N. Y., Fruit Grower

THE mechanics of pruning probably have not been changed in the past ten or twenty years. We have tractors and high-powered sprayers to speed other orchard work, but in pruning, the operator still climbs the trees, uses a step or straight ladder. The tools are about the same—a hand saw, hand clippers or long-handled shears.

Recently there has been interest in some kind of a platform or tower from which the operator can do the pruning without much climbing. These platforms are mounted on rubber-tired wagons, trucks or tractors. Some towers are built on mechanical pitchers so that the operator can be lifted into the trees. Some outfits have a platform which can be elevated and swung by hydraulic control.

The advent of air-power pruning has increased the interest in the use of an elevated platform. To take advantage of the fast action of air shears, the operator should control them with both hands. The first thought would be to have a long-handled shear so that most of the pruning could be done from the ground, but these are very tiring on the operator and leave too many long stubs.

I became interested a year ago in building a platform to see if it were possible and practical to trim from such a device. The platform of my outfit is 7 feet high, 4 feet wide, and 12 feet long and is mounted on a rubber-tired wagon, with a deck 30 inches high and 6 feet wide. There are two swinging catwalks, each 8 feet long. They are 20 inches wide, tapering to 16 inches at the outer end. They can be swung in almost a complete circle by an upright lever and can be raised to about a 60° angle. These catwalks are fastened to the upper deck.

In an orchard such as sour cherries or peaches which are planted about 20 feet apart, the wagon is stopped with the center about opposite the trunks of the trees on each side. The rear catwalk is used to trim the right hand tree, then swung to the left hand tree. The front catwalk is used in the same manner as the rear one. With one trip through the orchard, two one-half rows are trimmed. No attempt is made to trim the lower part of the trees. It is possible to trim a half day without leaving the platform. On trees planted farther apart, a trip is made down one side of a row and back on the other side. The operator is in a much better position to judge what limbs should be cut than when climbing the tree or working from a ladder.

The wagon is drawn by a standard orchard tractor which can be controlled from the platform by 4 ropes. One rope pulls the hand clutch in, another pulls it out and the other two ropes do the steering.

Recently I mounted a compressor on the front of the tractor, driving the

compressor from the front of the motor. The tractor motor is left running. If a power pruner is used, the tractor motor can drive the compressor, saving the cost and operation of a second motor. An air pruner requires the use of both hands to operate it rapidly.

The outfit is very simple to build and can be made from your own locally-sawed lumber. If the material for the platform is purchased, the cost should not exceed \$40.

Some of the advantages of an elevated platform are:

1. It avoids most of the climbing and ladder moving.
2. It promotes faster use of air tools.
3. The trimming is done from the outside of the trees.
4. The catwalks enable the operator to walk into the trees.
5. The catwalks are adjustable for various trees.
6. The operator is on a dry platform and avoids walking in snow or mud.
7. Trimming is done in half the time.

I think the use of a trimming platform and a power shear is practical and efficient. The platform can also be used for thinning and harvesting.

—A.A.—

HOME-GROWN MUSHROOMS

FOR MANY years certain companies advertised mushroom spawn for sale and agreed to buy back those that were grown. As nearly as we could determine, these "buy back" concerns had to buy very few. That, of course, didn't disturb them; they were more interested in selling than they were in buying.

Now, however, any gardener with a reasonably satisfactory cellar can grow mushrooms for home use. I know because I tried it last winter. Several companies that sell nursery stock are offering "mushroom trays." They contain a mixture of soil, humus and mushroom spawn. All you need to do is to water them and keep them slightly below ordinary room temperature.

Throughout the winter you will get several "crops." I doubt if you would make much money selling them but you will get fun from growing and eating them.—H.L.C.

—A.A.—

THE NEARBY GARDEN

WHILE nearness to the house is often mentioned as one thing to be considered in picking a garden site, it is my personal opinion that it is considered too little. Many a time I have strolled into our nearby garden after supper without any consciousness that there was work to do. But as I walked, I saw a weed here, or some overcrowded plants there, or perhaps a tomato that was showing pink, or peas ready for the kettle.—H.L.C.

Be sure your new SPRAYER is BUILT TO LAST

YELLOW DEVIL Sprayer IS built to last

A sprayer is no "bargain" if it can't stand strains and jolts of farm spraying. Or if it corrodes and clogs and wastes your time.

Yellow Devil Sprayers are engineered to take the rough going. They're built to last, with quality materials throughout. Yet you'll find Yellow Devil priced competitively.

You might as well have the best. See your dealer or write for free booklet of new models.

Plant Growing HINTS

1 Soil. An excellent soil for growing plants either in the house or hotbed is made out of equal parts of good garden soil, sand, and well-rotted manure. If you didn't save some garden soil last fall, you may still be able to get some from the garden during a mild spell.

If you are growing just a few plants, you can kill the damping off fungus which attacks plants just at the surface of the ground by putting the soil in the oven and baking it.

2 Temperature. Often the farmhouse kitchen is too warm for the best growth of small vegetables and flower plants. If this is realized, it can be helped to some extent. For example, do not choose a window next to the stove, and if there is some room where the temperature doesn't get quite as high, pick that instead of the kitchen.

Where electric current is available, you can grow a few plants in a room that is quite cool by using a heat lamp over them. It also aids in amplifying the light.

3 Light. In most houses light is inadequate and too uneven. The old bay window, which seems to be going out of style, was better for growing plants than modern windows. The use of an electric heat lamp, as mentioned under "Temperature," will do wonders in helping to grow good plants.

4 Watering. Probably more plants are over-watered than are under-watered. Give them a good soaking once or twice a week and let them alone in the meantime. Do your watering when the sun is shining on the flats, so that the surface of the soil will dry off fairly quickly.

An excellent way to add to the moisture in the air, which is often too dry, is to have a galvanized pan made to fit the space in your window. Put some pebbles in the bottom and then keep the pan filled with water so that it just about reaches the top of the pebbles. Set your plant boxes on the pebbles. The evaporation of this water will tend to keep the atmosphere moist.

5 Thinning. It is almost impossible to sow seeds in flats without getting so many that the plants will be too thick. It is a delicate operation to thin young plants in flats, but it is very necessary. Give them plenty of room. In fact, if you want the best possible plants, transplant some from the flat into individual containers such as flower pots, tin cans with holes in the bottom, or veneer band boxes.

The spindly plants so often grown are a result of a combination of circumstances which include too high temperature, too much water, and too little thinning so that each plant is desperately reaching upward for light. Obviously, to grow stocky plants you should avoid locations which are too hot, water sparingly, and thin drastically.

By and large, you can do a better job of raising plants in a hotbed than you can in the kitchen. There are now available, at a reasonable price, soil heating cable and thermostats for small electric hotbeds.

Many gardeners, of course, prefer to buy the plants, and good plants of many varieties of vegetables and flowers are now available anywhere in the Northeast.

AIR DRAINAGE

Fruit trees set in low spots suffer most from frost because cold air, being heavier than warm air, drains out these low pockets. It's a good idea to remember this when setting fruit trees.

A Word of Caution to the Novice Who Would Plunge into Poultry

By **L. E. Weaver**

"Gentlemen: Please send me all your bulletins on poultry. I'm crazy to get started in the poultry business."

MANY LETTERS similar to this one are coming these days to the agricultural colleges. Of course, they are not all about poultry but those are the only ones that reach my desk.

In answering these letters I would like to say something like this: "Dear deluded soul: You are entirely correct. You are crazy to go into the poultry business. Anybody is crazy who does it at the present time." But, of course, that would never do.

L. E. Weaver

What I actually say runs more along this line: "We are sending poultry bulletins as requested in your letter. May I suggest, however, that the reading of bulletins by itself is not a satisfactory way to get ready to enter the poultry business. You will lose much time in acquiring information that you won't be able to use. You will probably never run across some of the fundamental facts that you absolutely must have if you are to succeed. Read the bulletins by all means, but get a modern text-book on poultry and study that also."

Get Experience

Having gone that far I always add: "The best possible preparation for your venture is to get a job on a successful poultry farm and work there a full year. In any case, before you invest any savings, be sure to have a talk with the County Agricultural Agent within whose county you plan to locate."

Will they listen? Probably not. I seldom get a reply, but once in a while comes something that brings a smile. Mrs. X wrote: "Would you kindly send me your latest information on poultry farming. My husband has just entered the Navy, and so I have decided to start a poultry farm that we might work together when he comes home. I have had no experience in this line, and so don't know even yet whether I want to raise ducks, turkeys, or chickens."

To which I replied: "You have placed a large order. You state that you want to raise some sort of poultry and make money on the venture. You probably are aware that literally hundreds of people have had the same idea, and have failed on the latter part of the proposition. Many other people have succeeded. The difference between them is largely in experience. . ."

Back came this: "You sound most ominous when you say that the difference between successful and unsuccessful poultrymen lies largely in experience. Especially when you point out that in experience I am entirely lacking."

Then followed a story of a bantam hen and 9 chicks successfully reared, concluding with this: "So you see I'm not entirely without experience."

Disillusioned

As an extension poultry specialist I can't get away from the conviction that my job is two-fold: To help poultrykeepers do a better job so that they can stay in business; and to see that others are disillusioned before, rather

than after, they take the plunge into the poultry business.

Years ago, when I was new in this work, a young bank clerk came to me. He had a great urge to be his own boss and get out into the air and sunshine. His wife had some money. I helped him get started in poultry. Two years later he was back at his job in the bank. His wife no longer had her money. He never wanted to see another chicken. That sort of thing has been going on for years, and it doesn't do the poultry industry any good. The latest report I have read from a disillusioned ex-poultrykeeper is in the current best seller, "ANYTHING CAN HAPPEN." Relating the story of their venture into farming, George Papashvily, says:

"First thing I found out is that one of the best ways to make money on a farm is by not raising chickens. But it cost me a thousand dollars and took me a year to find this out. A very unsocial animal, chickens, picking each other to death, and stupid besides. Flopping and fluttering, creating commotions, they practically invite foxes and dogs and skunks and weasels to chase them.

"Believe me," I said to Helena Gertovna the day I sold the last coopful, "I'm through with chickens. And when I go back to Kobiankuri, maybe I convince them about subways and the radios; maybe I persuade them to the Empire State Building and automats, but they never gonna believe that in America chickens has to wear spectacles and tin skirts so they don't eat each other up. Never in this world."

Far be it from me to discourage anyone from raising chickens. In what I have said here I have merely been trying to keep people from discouraging themselves. The average would-be poultry raiser reads but a page or two of a catalog from some alert poultry breeder and at once becomes so enthusiastic that he decides to go all out. He takes an overdose. Before long he is swamped by unfamiliar and unsuspected details. About this time disease breaks out. That is the last straw. He quits.

In contrast with the plunger are the thousands of poultrymen who have made a success of the business. In almost every case they started in a small way and grew larger slowly. That is still the safest plan—even after you have read all the bulletins.

—A.A.—

SOME PRACTICAL POULTRY IDEAS

IN THE COURSE of my travels over the Granite State several items of interest have been encountered as to poultry management operations. Number one on the list was encountered at the farm of Kenneth Wheeler, Milford, N. H. He is doing his brooding with the use of an oil hot air furnace wherein the air is forced through ducts under the floor to consecutive eight-inch flues under a movable homemade brooder hover. The warm air entering each hover is deflected downward by the hard-pressed board hover, providing the essential chick warmth.

Mr. Wheeler claims that this system of heating is very efficient. Heat for the four to five brooding compartments on each floor of his double deck brooder house is ample and the slow moving air assists materially in the maintenance of dry litter conditions. The system is, of course, thermostatically controlled.

Mr. Ernest Nadeau, Meredith, conceived the idea a few years ago of using a long A-type nest supported about

BABCOCK'S Healthy Chicks

MAKE GREAT LAYERS

Last year ('48-49) our White Leghorns won as follows at the official egg laying tests: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird) for high average production all breeders in U. S. competing. This is highest average ever made. 6. We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND

We hatch White Leghorns, Red-Rock Cross, Rhode Island Reds, and Barred Rocks all year . . . own two hatcheries, with 530,000 egg capacity—three poultry farms and 15,000 breeders. We also carry on a complete pedigree-progeny testing program.

RICHQUALITY CHICKS ARE MONEY MAKERS

WE produce chicks for commercial poultrymen who are interested in birds that live and produce lots of big eggs. We have been improving our strain of White Leghorns for 35 years.

OUR chicks are as disease-free as modern science knows how to make them. Here are some of the reasons why: (1) We produce all of our own eggs on our own farms. (2) Our flocks are proved "Pulorum Clean." (3) All stock is vaccinated against Newcastle.

SHRAWDER'S ANCONA FARM, RICHFIELD 10, PA.

18 inches from the floor by legs. Birds enter this nest underneath and through the so-called cross bar of the A. Upon entrance, the birds may select either side of the continuous long nest box to perform their essential function of egg-laying. Hinged boards on the outer edge of the box just above the crossbar or nest box height allow for egg collection and apparently work well. Ventilation at apex of box should of course be provided.

Mr. Max Kapiloff, Keene, together with Mr. Authur Ward, Gill, Massachusetts, and a neighbor mechanic have designed and have available for sale a poultry house litter stirrer. This electric motor driven machine appears somewhat similar to the common rotary garden tractor in design. The main shaft carries a staggered series of cutting spikes which, as they revolve, dig into and churn the litter. This repeated churning or stirring will aerate the litter, assist drying action and tend to maintain better litter conditions within the poultry pen. A maintenance of aerated, dry litter within the laying or brooder pens certainly will go a long way towards improved poultry husbandry and reduction of new litter costs.—A. E. Tepper.

—A.A.—

CLEAN EGGS

Cleaning eggs before packing for market is drudgery I believe we all dislike, and I have practically eliminated that messy job on our farm. I used about six quarts of ordinary sawdust in each nest rather than straw and this did the trick. Incidentally, I mix in a handful of ordinary ground limestone when replenishing the sawdust to eliminate lice harboring there.—Vincent Aldrich, Fredonia, N. Y.

—A.A.—

CHICKEN OF TOMORROW

Plans for the 1950 "Chicken of Tomorrow" program have been completed in the Northeast, and entries qualifying at state contests will be shipped to Durham, N. H., for a regional wind-up on June 27. Previous to that date, state contests will be held—the dates of these contests to be announced soon.

The regional committee is made up of Richard Warren, University of New Hampshire, Durham; Frank Reed, University of Maine, Orono; Roy E. Jones, University of Connecticut, Storrs; Harold Rotzel, New England Poultry & Egg Institute, Boston; and J. R. McCurdy, New England public relations representative of A & P Food Stores.

By J. F. "Doc" ROBERTS

Dear Uncle Sam:

I realize I'm amiss in not thanking you sooner for the many bountiful gifts you have so generously showered upon me and other farmers. Of course many of these gifts have carried with them a demand for "box tops" and "wrappers" just the same as some of the gifts from breakfast foods or soap that we hear so much about on the radio. Very often, in your case, they have been more expensive than the gifts themselves.

There is a question I have always wanted to ask you as well as the manufacturers of soaps and breakfast foods. What do you do with all these "box tops" and "wrappers?" I am beginning to hear that in your case they are piling up in the form of potatoes, eggs in a cave in the Mid-west, grain in shacks and barracks, fats and oils, and so on. If this is true, I expect you will be giving them away without any requirement on my part and when you do I want you to be sure and keep us farmers in mind.

More Help

It has been reported that you are about to help farmers by buying hams, bacon and pork loins. I talked with a large hog packer recently and he told me that the way those particular products were selling to the consumer right now was on a basis of 23 cent hogs alive—that the reason hogs were selling at 18 cents and not 23 cents or better was because of the fats, oils, lard, etc. which were selling for less than the live hog. I wish, if you have the time, sometime, that you would write me why you are buying the very same parts of the hog that the consumer wants, is paying a good big price for, and of which there is no surplus; and if you are going to support hogs, why not support the part of the hog that no one can sell, namely, fats and oils.

Uncle, it seems to me that you have gotten yourself into an awful mess on your potato deal. Any of us dumb farmers could have told you what you were running into the way you were handling it. I do not believe, though, that we could have told you how to keep out of trouble had we known that you were going to allow 15,000,000 bushels of potatoes to come in from Canada!

Eggs vs Grain

We are learning a good deal about eggs and many of us have either got to go out of the egg business or "go broke." This is particularly ironic with grain going to waste in one section of the country and its cost prohibitive in another. Eggs have been selling in Canada for 29 cents a dozen and now they are coming over here and breaking down our markets while you are storing eggs which you now report will probably have to be dumped.

Foreign wool markets are reported to be almost the highest on record. Someone has said that these wools are being bought by countries who are using our money, while our wools are being held down to almost the 1941 price, and at the same time wondering why the tremendously valuable sheep, lamb, and wool industry in the United States is fast disappearing.

Sometimes I wonder how some of our manufacturers can give away such bountiful prizes for guessing the title of a song or some other fool thing. There is no other answer except that they make their money. When I see you giv-

ing away prizes without being in a position to make a penny, there is no question where the money comes from.

Now, Uncle, again I want to thank you for the presents you have sent, but I do hope that soon, and the sooner the better, I will not have to pay the bill for them, then I can thank you sincerely and not with my tongue in my cheek.

Yours sincerely,
"Doc."

— A. A. —

RADIO PROGRAM TO DISCUSS INBREEDING

Beginning on February 24 the Rural Radio Network will begin a series of programs on the subject "Should Dairy Cows Be Inbred?" The co-chairman of the discussion will be Bob Child of the Radio Network and Ray Albretsen of the New York State College of Agriculture.

The dates of the program are February 24, March 3, 10 and 17, and the time of each program will be 12:30. The series will be introduced by Ed Eastman, editor of *American Agriculturist*, and among the men who will appear on the series are Dean Victor A. Rice, University of Massachusetts; Frank Decker, Three Rivers; Firman M. Huff, Honeoye; K. C. Sly, McDonald Farms, Cortland; Leland Lamb, American Dairy Cattle Club, Ithaca; James M. Biermeister, Van Horne Farms, Van Hornesville; Tom Milliman, G. L. F., Ithaca; Warren Wigsten, Poughkeepsie (a Cornell student); Doug Dodds, Champlain (a Cornell student), and Prof. S. A. Asdell, Cornell University.

Bread-Baking Contest

FOR NEW YORK GRANGERS

GRANGERS from one end of New York State to the other are going to have a chance to show whether they can still bake good homemade bread—and we are betting that they can! Bread has been chosen for this year's Grange baking contest, the 15th to be sponsored jointly by *American Agriculturist* and the New York State Grange.

With the elimination contests getting under way in the Subordinate Granges this month, we predict that thousands of farm kitchens will soon be fragrant with the sweet, tantalizing smell of fresh baked bread! Last year more than 3,000 Grangers participated in the Grange sugar cookie contest.

The bread contest is a project of the State Grange Service and Hospitality Committee and will be directed by the Committee chairman, Mrs. John Lavery of Geneseo, N. Y. Assisting her will be

an entry prize of \$3.00, making a total of \$159.00 in Grange entry prizes.

Besides these cash prizes, many attractive merchandise prizes will be awarded to both State and Pomona winners by *American Agriculturist* advertisers. They will be announced later in these columns and a list of them will be sent to chairmen of Pomona Service and Hospitality Committees. Additional prizes for Pomona Grange contests and prizes for Subordinate Grange contests will be arranged for by the chairmen in charge of the contests, who have had fine cooperation in the past from local merchants.

CONTEST RULES

1. Each contestant must be a member of a New York State Subordinate Grange. All Grange members (men and women) are eligible, with the exception of those who are professional bakers.

2. Each contestant is to enter 1 loaf of white bread. (See score card on this page for standards of scoring. A copy of the score card will be furnished every contestant. It was prepared for this contest by Miss Lillian Shaben of the Cornell University Food and Nutrition Department, who has demon-

strated bread-making to hundreds of women throughout the state.)

3. Subordinate Grange contest winners will compete in the county contests, and the county winners will match bread loaves in the final state contest in October.

HOW TO CONDUCT LOCAL CONTESTS

Here are suggestions for Subordinate Grange chairmen in charge of the local contests:

1. Set an early date for your bread contest and announce it at your next meeting. Give score cards to contestants and put a notice in your local paper about it. A special reason for having your contest early is the fact that the annual meeting of the New York State Grange will be held in October this year, instead of December.

2. Choose judges and arrange with local merchants for prizes. Only prizes for the Pomona and State contests will be donated by *American Agriculturist* and our advertisers.

3. Have judges score entries according to standards of the contest score card. If there is a Home Economics expert among the judges, invite her to give a short talk on how to bake good bread. This could be done just before winners' names are announced.

Last year over 3,000 Grangers took part in the rolled sugar cookie contest. We hope that there will be just as many or more contestants in the Bread Contest, if only to prove to the world that farm women can still bake wonderful bread. Even though you have not baked bread in ages, try your hand at it and see how good it seems to have

Total	100	_____

STANDARDS FOR SCORING

SIZE: Each contestant is to enter one loaf of white bread, baked in single loaf tin approximately 9x4x4 inches. Size of pan, however, is not so important as quantity of dough put into pan. Too small a quantity results in a thin, flat loaf; too large a quantity results in a loaf too high and often badly shaped.

SHAPE: Depending upon quantity of dough in pan and upon care during baking, the loaf should be of good proportions and be of uniform rounded shape on top. Ends should be about same height as middle of loaf. Loaf should fill out corners of pan.

CRUST: Top and bottom crusts should be a uniform, not streaked, brown color; sides of loaf may be somewhat lighter in color. Texture—crust should be tender and crisp, not steamy nor too tough and hard; it should also be smooth, not bubbly or lumpy. Thickness—top and bottom crusts should be uniformly about 1/8 inch thick.

CRUMB (inside of loaf): Lightness—well raised, not heavy for size. Grain—the cells (grain) should be small and uniform in size throughout. There should be no heavy and dense streaks. Elasticity—springy when lightly pressed, not solid from too much flour, and not doughy from being underbaked; tender. Moisture—slightly moist (not dried out from too much flour or overbaking or staleness). Color—color of "white bread" should be creamy white. In all bread, the color should be uniform, not streaked.

FLAVOR: This means both odor and taste. There should be no suggestion of sourness nor of yeast. The flavor of salt and sugar should be moderate. There should be no undesirable flavor of fat in the crumb or on the crust. The wheat flavor should predominate.

the other members of the committee, Mrs. Herbert Thomsen of Poughkeepsie and Mrs. Ola Scudder of Fleischmanns, as well as the chairmen of all Subordinate and Pomona Grange Service and Hospitality Committees. Score cards and copies of this announcement are being sent by the State Committee to Pomona chairmen for distribution to Subordinate Granges.

As in other years, there will be a series of three contests—local, county and state. After Subordinate Granges hold their contests, the winners will move up to the county contests. In the final match at State Grange next October, the 53 county winners will vie for the title of State champion bread baker and valuable cash and merchandise prizes.

PRIZES

Twenty-seven cash prizes, totaling \$100.00, are again offered this year by *American Agriculturist* to State Contest winners. These will be divided as follows:

First	\$25.00
Second	20.00
Third	15.00
Fourth	10.00
Fifth	5.00
Sixth	3.00
Seventh	2.00
Eighth to 27th, \$1.00 each	20.00

Also, each county winner taking part in the State Contest in October will receive from the New York State Grange

real homemade bread again. And if you have never baked a loaf of bread, give yourself the fun of this experience. It is easy to learn to bake good bread, and you may surprise yourself and turn out to be the State Champion Bread-baker next October. The top state winner in last year's rolled sugar cookie contest, when interviewed at the State Grange annual meeting, revealed that

she had never made rolled sugar cookies until she entered the contest!

We of the staff of *American Agriculturist* wish all of the thousands of grangers who take part in this interesting and educational contest the best of luck. Names of Pomona and State winners will be published in *American Agriculturist*, together with any good pictures which may be sent to us.

ATTENTION POMONA CHAIRMEN!

Before the prizes for Pomona contests can be sent to chairmen of Pomona Service and Hospitality Committees, we must have an accurate list of names and addresses of chairmen to whom the prizes should be shipped. We would like to have this list as soon as possible, inasmuch as no prizes can be shipped until the list is complete.

If you are chairman of your Pomona S.&H. Committee, please write at once to State Chairman Mrs. John Lavery, Geneseo, N. Y., and give her your correct name and mail address. This is more important than ever this year because the bread contest will end in October, instead of December as in other years.

Keynote Simplicity!

No. 2112. Softness starts at shoulder in this casually fitted blouse. Belted treatment gives new bloused line and pert peplum effect. Sizes 10-20; 36-40. Size 16, 3 yards 39-inch.

No. 2050. Novel front peplum tops the full flared skirt. Spike the petite collar, peplum and sleeves with gay contrasting ricrac. Sizes 6-14. Size 8, 2½ yards 35-inch.

No. 2135. Fashion-wise collar drapes softly to form the pretty picture frame neckline. Sizes 12-20; 36-44. Size 18, 4½ yards 39-inch.

No. 2436. Junior size dream dress has easy-exit buttoned shoulders plus

clever bias treatment for interest above and below. Sizes 11-19. Size 15, 4 yards 35-inch.

No. 2549. Something new in the field of shirtwaists! This easy-to-make has yoke and sleeve cut in one piece. Easy six-gore skirt. Sizes 10-20; 36-40. Size 16, 4 yards 39-inch.

TO ORDER: Write name, address, pattern number and size clearly. Enclose twenty cents for each pattern wanted. Add 20 cents for our attractive new Spring Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to American Agriculturist Pattern Service, Box 42, Station O, New York 11, N. Y.

Today in Aunt Janet's Garden

THIS warm winter has got everything in the mood to grow, and it is with mixed feelings that I took a look outside just now. In January, daffodils pushed up their foliage a few inches, snowdrops are in flower in sheltered spots, and both the leaf and flower buds on trees and shrubs are swelling—forsythia buds have burst already—it looks as though something's going to get nipped!

This feeling of Spring's nearness hurries me to get the seed orders in. Everybody is served better if a last minute rush is avoided, the seedsman as well as the customer.

The seeds that have to be started indoors soon will need to go in, and I must see that flats, soil, and fertilizer are available.

The other day I made the rounds of the flower border and found that hard freezing had lifted some newly set bulbs clear out of the ground. That is apt to happen to fall-transplanted perennials too, and a little replanting needs doing before the damage is permanent.

The berries of the Boston ivy on our house walls have been highly attractive

to bird visitors this winter. Besides the usual winter birds—juncos, jays, and sparrows—we have had quantities of strange visitors which I have not found time to identify.

One of the most interesting talks I have heard recently was made by a duck farmer who for years has interested himself in the habits of certain wild birds along the south shore of Long Island. Everybody knows that duck farming keeps a man busy, but somehow this man has been able to find time every year to band birds for the Wildlife Service of our Government—then when these banded birds are found later in South America or Mexico, or are found back on Long Island the next year, definite information is accumulated about their life history.

This duck farmer has done so well at his observations that his records are being used by museums and ornithologists, and he does it just for the love of doing it and mostly at his own expense. The bands are provided, but he does the rest.

Especially where there are children in the family, it adds to the day's pleasure to know when the first song sparrow arrives, where the robins are nesting, when the swallows leave, and so on. The habit of observing what goes on around us makes life much more interesting.

BE SATISFIED

In remodelling or repairing your home be sure to use reliable equipment and good materials. Patronize American Agriculturist advertisers and you will be satisfied.

Something New!

FOR THE benefit of those of our readers who like to be able to get "materials and all" when they order a needlework item, we are starting a new service with this issue. In the case of these four items, not only is the material furnished, but they're readymade and you put on the finishing touches in the way of embroidering designs, crocheting, appliques, or whatever the

instructions call for. You'll find this service very convenient and the prices reasonable.

TO ORDER any of these items, write to Embroidery Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y., and enclose money order or check for the amount of your order. Be sure to give name and number of article.

DIMITY DRESS — KIT No. 8647 contains a sweet ready-made dress of pink, blue or maize dimity, finished with wide sash, pin tucking and imported French white lace edging on collar, sleeves and belt loops. Size 6 months to one year. Embroidery floss included. Price \$1.98.

TOT'S KIMONO—KIT No. 8642 contains an infant's ready-made flannel kimono, which has a dainty design stamped on good quality flannel, in either maize, pink, blue or white. Edges hemstitched for crochet; rayon crochet thread for edging included; also embroidery floss. Price each, 89 cents. State color desired.

LINEN GUEST TOWELS—KIT No. 8701 contains a pair of guest towels of fine quality linen, which may be had in oyster or pastel green. Towels come stamped with attractive designs for cross-stitch embroidery, and are finished with hand thread drawn hemstitched hems; embroidery floss for working and instructions are included in the package. Price per pair, \$1.59.

CUTE TOY DUCKS—KIT No. 8669 contains a pair of toy ducks stamped on stocking knit material, red and yellow patches and floral print for making the toys. Price per pair, 85 cents. Embroidery floss included, but no stuffing.

Routing That Cold

THERE IS no health rule that pays bigger dividends than guarding against colds. If you would be free of them, see that you get enough rest. Sleep builds up body resistance to cold. The right food is all-important too — fresh fruits, leafy vegetables, milk, eggs, meat, and the like. Regular exercise, fresh air, and sunshine add their bit to the body's good health and conditioning.

Dress yourself and your children with sufficient clothing indoors and out to keep your body well protected. When feet are soaked, change shoes and hose immediately. When you feel a draft, move. As colds are contagious, stay away from the person who has one.

Fifty per cent of all absenteeism in schools and industry is caused by the common cold. It is estimated that this percentage could be cut drastically if cold victims would stay home for 24 hours at the first sign of a cold, as colds are most contagious in their very early stages. After the first 24 hours, the danger of contagion is said to diminish rapidly.

At that very first chilly feeling take a warming up exercise. Inhale a dozen

deep breaths of fresh air to the full capacity of your lungs. Rise slowly on your toes, breathing deeply and slowly all the way in. Slide hands slowly up hips to ribs, throwing shoulders back and chest out as you do so. Exhale just as slowly and repeat. This extra oxygen you inhale stimulates nature's own heating system.

If possible, go to bed during the first 24 hours of a cold, keep warm, and drink liquids. Fruit juices alternated with water tend to purge the body of the cold, and a laxative works in much the same way. Keep the air in the room fresh. By giving up as soon as you come down with a cold, you will help yourself to avoid the complications that make a cold "hang on." If your cold persists, call a physician.—B. C.

5 doctors prove this plan breaks the laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

TIME WELL SPENT

Time taken to read the advertisements in AMERICAN AGRICULTURIST is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad" be sure to mention

AGRICULTURIST**

Pretty Towels and Wash Cloths Work Wonders

By BLANCHE CAMPBELL

TEACHING your child cleanliness is easy if you give him his own towel and wash cloth that have been personalized especially for him. Then it will be no chore to get him to form the habit of washing before meals and to keep a clean, well-groomed appearance. The child who has his own individual wash cloth, towel, and comb isn't so apt to forget.

Children's taste in towels and wash cloths runs more to pictures rather than initials or monograms. Little boys' towels may be decorated with boats, planes, and jeeps. Little girls prefer birds, flowers, and colorful figures. Both boys and girls love animal pictures. Appliques are colorful and are well liked by children. They are easy to do and add just the right note of decoration.

Naturally everyone knows that individual towels and wash cloths are best for sanitation. I have found that when a child has his own towel and wash cloth to use he takes better care of them and is more likely to do a good job of using them. And when there are several children in the family, individual embroidered bath towels and wash cloths help each child to identify his own.

Competition is a great incentive to get children to do their best. Nothing like a little good-natured competition to keep them on their toes in keeping

up with brother or sister. Praise the child who washes before meals without being told or reminded, who doesn't make a mess or leave the bathroom too disturbed. Of course, you should be reasonable about this because you can't expect small children to be as neat as grown-ups.

Praise given for a task well done makes a child put out an effort to earn it, and also spurs on other children in the family to do their best. Judiciously give out your praise so that no child in the family feels slighted.

— A.A. —

OUR BIRD FRIENDS

WHEN the frost, wind and rain have swept and washed the earth of the last trace of summer in a mad orgy of earthcleaning, and the last witch hazel blossom has turned from gold to mere brown threads, and the first

snow stars drift down past the chimney's spiral of fragrant birchwood smoke and thatch our roof in sparkling white, then do we set the table for our beloved guests, the birds.

For the somber little chickadees, we run a line out of the reach of crouching cats, usually across a sheltered corner, and on this we hang stale doughnuts, their holes well filled with peanut butter. In between the doughnuts are tied fat morsels of suet and bits of bacon rind. Near a window we set a fir tree firmly, and this is likewise decorated. A nearby tree has wire racks well packed with suet for the woodpeckers; and a covered feeder holds seeds and a bit of suet and crumbs, for it's here that Wally Nuthatch and his cousin Rosy-breast love to dine.

Cornstalks laid slanting on a pole provide a shelter for the pheasants and other ground-feeding birds, and here they look daily for the scattered grain and seeds they love.

These birds are the "regulars" but one thrill often of a snowy day to see passing visitors. Sometimes it's the evening grosbeaks, pale gold and white and gray like a November sunset, and their brothers the pine grosbeaks, the the ladies all soft gray like April clouds and the males with their breasts as red as a frostbit Baldwin. Here, too, the redpolls pause for refreshments. They are softly colored like a sparrow, only they are more keen for color and wear red caps and neck scarves of rosy hue. The tree sparrows will drift in by ones and twos, their pert heads with red caps, and their soft gray vests holding a button in the middle.

These are only a few of the birds that enjoy our hospitality between November's gray and gold and April's green. One is well repaid with beauty and song for the small time it takes to befriend these feathered bits of life whose wings fold as they settle to feed 'twixt wind and weather. — Norma Roberts, Old Depot Rd., Putney, Vt

THE YOUTH'S COMPANION

Outwitting the Sioux

By MYRON B. GIBSON

FOREWORD

"The neatest scheme I ever worked on the Indians," is the way old Thad Bainbridge sums up this thrilling and amusing tale of how he outwitted two young Indian braves. The story is taken from the YOUTH'S COMPANION of June 1892.

OLD THAD BAINBRIDGE, my guide and companion on frequent hunting and fishing trips among the lakes of the Park region of Minnesota, had paddled those waters when the Sioux, the original possessors of that beautiful section, were numerous. Not the least pleasure of these trips was that of listening to the old man's tales of those early days.

"I've played many a trick on the redskins," said old Thad, "but the neatest scheme I ever worked on them was one I played on a couple of Sioux one summer in the forties.

"I had frozen my feet the winter before, and was not well able to get round on the prairie, so I made up my mind to take a good long rest and get ready for the fall trapping. With that idea I rigged up a brush camp on the creek that joins these two big lakes, and took things easy.

"I had been having a nice quiet time all by myself for a month or more before I knew there was an Indian within fifty miles. I could kill a deer any day within half a mile of camp, so I hunted just enough to keep meat on hand. Most of my time I spent fishing and paddling about and speculating where I'd be likely to find the best trapping that fall.

"Thinking about Indians didn't trouble me a bit. I had had so many brushes with the Sioux, and had always made them suffer so much and then got out of their way so mysteriously, that they had sized me up as a great medicine man, with a special Manitou to look out for me. They meant to keep out of my way, and I knew it.

"But I didn't go round with my eyes shut, I can tell you, for I knew too much about Indians to expect them to stay in one mind.

"One warm morning I got into my canoe and started for the upper lake. You know there are lots of bulrushes round that lake, and I needed about a canoe-load of them to stop the leaks in my cabin roof.

"After I had cut a lot of the bulrushes and tied them in bundles about as big around as my body, I laid them in the bottom of the canoe and paddled farther up the lake for a little fishing. You recollect that place betwixt the island and the point of timber where we struck that school of big black bass last summer? Well, there were far more bass there forty years ago.

"I cut me a good pole among the willows on the island, and tied a big rock fast to the rope at the bow of my canoe. Then I paddled close to the island, hoisted the rock overboard for an anchor, and began fishing.

"It was about the first of July, and the hot sun made me sleepy. There I sat, nodding, and starting awake to pull in a fish whenever I felt a jerk. But caution prevented me from falling completely asleep, and I tell you it was

BOSTON, THURSDAY, JUNE 23, 1892

lucky for me that I did occasionally open my eyes wide and take a good look around. For one of those times I caught sight of a canoe crossing the upper end of the lake.

"There were two redskins in it, and they were about half a mile away. I guessed at once how they happened to be there. They had come from above, and started down the lake when they caught sight of me, and hurried up to get ashore and under cover before I'd see them.

"I knew they had their eyes on me, and I knew it wouldn't do to let them know that I had sighted them. So I pretended to keep on fishing while I watched them out of the corner of my eye. I knew well what their game would be. The shores of the lake were all prairie excepting the island and the big wooded point. I was anchored between those two bits of woodland. The Indians meant to sneak into the mainland woods, and shoot me from that point.

"Well, those two reds made their paddles fly till they reached shore. Then they pulled their canoe up into the bulrushes out of sight. Next they cut across the prairie, bending so low that I could see nothing of them in the tall grass except the hump of their backs now and then.

"They were hurrying to get behind the shelter of the woods. Once there, they would take their time to creep up and pop me over, for I was close to the shore.

"I sat still as a mouse till they went out of sight behind the trees. By that time I had my plans all ready. I might

have paddled behind the island and got away easily, but it wasn't in my style of those days to run away from two Indians. Besides, I knew that I'd soon have a whole tribe of Sioux after me if I let those two carry away the news that they had seen me.

"Much obliged to you, my copper-colored friends, for going behind the bushes while I make my toilet," said I to myself. 'If you will just wait till I slick up a bit, I'll surprise you.'

"The minute they went out of sight I pulled up my anchor-stone, and put that big rock into one of my bundles of bulrushes. I did not take the anchor rope off the rock, but just tied the bulrushes firmly round the stone.

"Next I took off my buckskin coat and buttoned it round the bundle. Then I propped it up solidly in the middle of the canoe, just where I had been sitting, and I clapped my old hat on top of it.

"Finally I stuck the butt of my fishing pole among the other bundles of bulrushes, and set it slanting out over the water in front of the dummy I had dressed up.

"In my pocket I had a heavy two-hundred-foot line that I used for trolling with live frogs. I tied one end of this to the dummy, and took the other end in my teeth. My intention was to swim ashore, but just as I was about to do so I reflected that the boat was not now anchored, and I might as well paddle the distance, because the Indians certainly could not see me from where they must have reached by that time.

"So I paddled to the island. Then I took out my old double barrel and my

powder horn and gave the canoe a shove outward. The trolling line paid out nicely. When the canoe, with the dummy in it, had gone out to where it had been with me, I stopped it by holding the line.

"There was a gentle breeze from the island, which kept the canoe pretty steadily in place in the little channel between the island and the point the Indians were making for.

"When I saw that the dummy and fish pole looked all right, I dodged back among the willows out of sight. Then I looked again at my dummy.

"Well, Bob, I just had to lie down and roll and laugh when I squinted at that image. It sat up—facing me—as straight as a judge, and held that pole as natural as life.

"I lay in the bushes a long time looking at the opposite shore before I saw another sign of the two Indians. The breath of wind kept the canoe well out at the end of that trolling line. The dummy was about fifty yards from me, and about the same from the opposite bushes, to which I expected the Indians to crawl.

"By and by I saw one of them put out his head from behind a tree a good way back from the lake. They knew who they were after, and that made them so cautious they were a good half hour in working their way to the point. Now and then I'd see them dodging from tree to tree. At last they reached the edge, and I could see them peeping out from among the bushes.

"I was too far off to see their looks clearly, but I imagined I saw them grinning when they got sight of that scarecrow sitting out there, fishing away so quietly with its back toward them. I could scarcely keep from laughing out loud, but I didn't for I knew I'd have some serious business on hand in a few minutes.

"Pretty soon I saw both of them poke out their rifles and take steady aim. Just when their guns cracked I gave such a pull with my line that the canoe nearly capsized, and out tumbled the dummy head first on the side of the canoe that had swung round nearest to me. As the bowline was tied to the stone in the dummy, the canoe was now anchored. It sort of hid the tumble from the two shooters.

"I've seen some comical things in my time, but I never wanted to laugh more than when I saw that old hat go diving for the bottom. But I kept as still as a mouse, and so did those Sioux for a spell.

"The weight of that rock kept the dummy at the bottom, but my old hat came off and rose to the top, where it floated with the fishing pole.

"Still the two Sioux made no move. You see the rascals weren't sure they had killed me. They didn't know but I'd jumped overboard, and was hiding behind the canoe. But when they had waited long enough for me to be drowned if I hadn't come up, the wind turned the canoe round so that they could see both sides of it.

"That satisfied them and they both came jumping out of the bushes to the edge of the water. Such a screeching and yelling with delight you never heard.

"They were both young fellows, and the idea that they had succeeded in killing the man that all their old braves half believed was protected by

(Continued on Opposite Page)

Outwitting the Sioux

(Continued from Opposite Page)

some magic, just tickled them half to death. A white man's scalp and gun, and that scalp my scalp, and my old double barrel, to carry back to their village — why, they thought they felt the biggest kind of feathers in their caps already!

"When they got tired of yelling and dancing, they took off their powder horns and bullet pouches — about all they had on except their paint and breech clouts — and laid them on the beach with their rifles. Then they jumped in and swam for the canoe.

"As soon as they reached it, both of 'em climbed into it and began to look around for their victim. The water was clear as crystal, but just at that place the bottom is covered with water moss two feet deep; that's why it's such a good place for bass.

"The weight of that rock sunk the dummy so deep into the moss that the Indians could see no sign of it. They looked and looked, and at the same time inspected and jabbered about my hatchet and knife, which I had left aboard when I landed.

"After peering down into the water for a long time, and chattering away in Sioux, one of them took hold of the rope and began to pull up the anchor. I kept my gun on them all the time, and had the best kind of a chance at them while they were peeping into the water, but I knew I'd have as good a pop at them when they pulled up that dummy. I'd rather have let both of them get away than miss seeing their surprise when they clapped eyes on that.

"I wasn't sorry I waited, for I never saw anything to beat the look of terror and superstition on their faces when that bundle of bulrushes came to the top with my old shirt buttoned round it.

"As they let it fall into the bottom of the boat, their jaws fell so wide apart I could see almost every tooth in their heads.

"Ugh! Ugh!" they both grunted, and their knees knocked together so they came nigh falling out of the canoe.

"I guess they begun to think the old braves knew what they were talking about when they warned them that I was an evil spirit that they'd better let alone. At any rate I never saw Indians much worse scared.

"Much as I liked the fun of watching them, I knew it wouldn't do to give them much time, as they'd be sure to jump out and swim for shore as soon as they could collect their wits.

"I didn't mean to kill either one of them, but to save myself from the rest of the tribe it was necessary to wound and capture them. So I drew a bead as close as I could on the shoulder of the biggest one.

"At the crack of my gun both of 'em fell. The one I had hit came slap down in the canoe, the other fellow jumped head first into the water before I could get a bead on him with the other barrel.

"I ran down to the beach and watched for the swimmer to come up. My notion was that he would dive and swim for the other shore. I meant to let him have it in the hip whenever he tried to go up the bank. The distance across was about eighty yards of water, and I knew I could hit him when I pleased.

"I could hear the one in the canoe groaning with the pain of the bullet in his shoulder. Sometimes he lifted his head and looked at me. But what had become of the other?

"While I was waiting I jammed a charge into the barrel I had fired. We had no breech loaders in those days, but I calculate I had a knack of pouring in powder and ramming patch and bullet down as fast as any living man.

"Did I keep my eye peeled mean-

time? My boy, a hunter in the Indian country never keeps his eye unpeeled. Don't interrupt me with no more suggestions like that.

"Just as I opened my cap box I saw a black head come up close to the canoe. The unwounded one meant to hide behind the canoe till he could make up his mind what to do. But he came up on the wrong side.

"Next moment he was down again, but in that instant I had fired.

"I missed him on purpose, for I reckoned he would think my double barrel unloaded by the two shots.

"Next moment I had the cap fairly on the newly loaded barrel, and up he came with a yell. He laid his two hands on the canoe from behind, and lifted himself in. Next moment he untied the anchor rope, and threw the end over.

"Then he picked up a paddle. I was afraid I'd have to shoot him, but I waited to see what he meant to do. Mind, I didn't want to shoot him less'n I had to; but if I had to, I shouldn't 'a' spent much time cryin' over it.

"Well, sir, if ever there was a brave, that young fellow was one. Instead of making off, he came straight ashore at me! You see he was sure I had not another shot ready.

"He had my hatchet and knife, and I'll be hanged if he wasn't coming ashore to have it out against me with my own weapons.

"When he was within five yards I lifted my gun and put the butt to my shoulder.

"He laughed in ridicule, and shoved the canoe ashore. At that instant I didn't see what to do except shoot him; but the other Indian gave a cry from the canoe. He had seen me loading; and his word told the young brave the fix he was in.

"Well, sir, that word and my mercifulness in kind o' hesitatin' about shooting him was nearly the end of me, for

the reckless young rascal flung my hatchet so suddenly at my head that I only just managed to dodge it. Next instant he sprang at me with the knife.

"But he jumped straight at the muzzle of my gun; and the force of the blow that he got took the breath out of him. He grabbed himself with both hands and fell forward. Before he could pick himself up I knocked him senseless with the butt of the gun.

"What did I do then? Why, I hauled at my trolling line, and pretty soon it came loose from the dummy. Then I tied the hands of the one I had struck — tied them behind his back — and tied his legs and left him to come to his senses.

"When I went to the other fellow in the canoe, I found he had fainted from loss of blood. I lifted him out and tied him, too, so that he could not move in case he should revive while I was off for their guns.

"By the time I came back they had both returned to their senses. I carried the one that I had hit on the head over to where the other one was, and explained to them both, as well as I could with my limited command of their language, what I intended to do. Then I put them both into my canoe and made for my cabin.

"Well, sir, I got the bullet out of the wounded redskin, and nursed and fed him for more than two weeks before he was able to sit up. Meantime I kept the other one bound firmly with thongs and chains from my traps. I wished I had not felt it necessary to do so, but I knew there was no trusting him.

"As soon as I thought the wounded one was strong enough to stand the trip, I put them both in their own canoe, which I had recovered. I gave them enough to eat for a week, and placed beside them their rifles, unloaded. I gave them no ammunition, for I did not think I could trust them. Then

I cut the thongs that bound the unwounded one.

"Young braves," said I, 'go back to your people and tell them the white man is their friend. If Indian does not try to kill white man, white man will not kill Indian. Tell your brothers how you tried to murder me, and how I treated you. And ask them if they do not believe that a Great Spirit watches over me. If Indian hunts me, Indian heap die. Now go.'

"I tell you, Bob, it made me feel good for a week to see the look of joy and hope in the face of those two young savages. Did I ever see them again? Yes, and their tribe, too, all good friends of mine after that.

"But it's bedtime if we're going trolling early in the morning; and I'll tell you the rest another time." —The End.

Help Available in Estimating Timber

EVERY New York State farmer who has a woodlot will be interested in a new service which is available through the cooperation of the State Conservation Department and the State College of Forestry at Syracuse. When you sell timber it is now possible to get a trained forester to mark trees which should be cut, and to get an estimate of the amount of lumber the trees will make.

The State has been divided into 15 districts, and requests for help may be made to the forester in your district. Here are the names and addresses:

District 1—Otsego, Delaware and Schoharie counties. The forester is R. M. Hick, 140 Main St., Oneonta.

District 2—Broome, Chenango and Madison counties. Forester, C. E. Baker, 15 S. Broad St., Norwich.

District 3—Chemung, Tioga, Tompkins, Cortland, Cayuga and Onondaga counties. Forester, J. D. Kennedy, 21 Clinton Ave., Cortland.

District 4—Steuben, Allegany, Schuyler, Seneca, Ontario, Wayne, Monroe and Livingston counties. Forester, I. S. Bowlby, 5 E. Steuben St., Bath.

District 5—Niagara, Orleans, Erie, Genesee, Wyoming, Cattaraugus and Chautauqua counties. Forester, H. E. Dobbins, 335 E. 3rd St., Jamestown.

District 6—Oswego, Jefferson and Lewis counties. Forester, F. E. Jadwin, Box 31, Lowville.

District 7—St. Lawrence county. Forester, W. F. Pratt, 79 Main St., Canton.

District 8—Herkimer, Oneida and Montgomery counties. Forester, A. J. Woodford, 270 N. Main St., Herkimer.

District 9—Franklin, Clinton and Essex counties. Forester, W. E. Petty, Saranac Lake.

District 10—Fulton county. Forester, M. C. Fisk, Northville.

District 11—Washington, Saratoga and Warren counties. Forester, S. M. Farmer, Box 751, Lake George.

District 12—Greene, Columbia, Rensselaer and Albany counties. Forester, C. P. Fatzinger, Box 430, National Bank Bldg., Catskill.

District 13—Orange, Ulster, Sullivan and Rockland counties. Forester, S. G. Bascom, 2 South St., Middletown.

District 14—Dutchess, Westchester and Putnam counties. Forester, E. D. Brockway, 2 Cannon St., Poughkeepsie.

District 15—Nassau and Suffolk counties. Forester, C. E. Dare, Selden.

— A.A. —

About 85 per cent of the nation's corn crop never leaves the county where grown since it is used for livestock feeding. Only 15 per cent finds its way into trade channels, most of which is marketed through the principal grain exchanges at Chicago, Minneapolis, and Kansas City.

They Know Their Tractors

THE GROUP above are New York State winners in a Tractor Operators Contest. From left to right they are:

Back row: C. M. Edwards, 4-H Specialist in Agricultural Engineering; Norman Beyea, Tractor Maintenance Project Leader in Seneca County; Wayne Bertram, Contestant in Jefferson County; Roy Sauter, Contestant in Lewis County; Fred McCloskey, County 4-H Club Agent in Lewis County.

Front row: Donald Pell, Contestant in Seneca County; Ray Halsey, Tractor Maintenance Project Leader in Suffolk County; Phil Hans, Contestant in Suffolk County; Tom Barden, Contestant in Onondaga County; Director L. R. Simons.

Each of these contestants placed in the 'excellent' group in the N. Y. State Tractor Operators Contest held at the State Fair this past September. There were 60 boys representing 30 counties in the State Contest. The Tractor Operators Contest is a part of the 4-H Tractor Maintenance Program which has been carried on for 4 years in New York State. In 1949 there were over 2,000 boys who received instruction in

the daily care of their farm tractors. Following completion of that work they were eligible to enter a County Tractor Operators Contest to demonstrate their skill in the safe and proper handling of the tractor. The two best contestants in each county represented their county in the State Contest. The 'excellent' group in the State Contest received an educational tour as part of their award. While on the tour they visited Dr. Simons, Dean Myers, and the Agricultural Engineering Department at the College; also, the Spicer Farm at Apalachin where many soil conservation practices were put into effect in a single day, and H. E. Babcock's farm, Sunnysables, where they saw pen stabling of dairy cows in operation. The theme of their tour was "Mechanizing Farm Work."

After being highest contestant in the State Contest, Roy Sauter represented New York in the first Regional Contest held at Eastern States' Exposition in Springfield. He won over 7 other state contestants at that time so he holds the title of "Champion Tractor Operator in the Northeast." Roy lives on a dairy farm at Lowville where he operates it with his father and brother.

Kernels, Screenings and Chaff

By H. E. BARCOCK

IT HAS often been said that the one sure thing in life is change. Despite this fact, I am amazed by the number of people who resist change and who are made acutely unhappy when they have to make adjustments.

It has always been my philosophy that change was what made life interesting, and that the adjustments demanded by change were in themselves an educational process.

Changes in Farming

As I look ahead to the next few years—I think they are going to be most interesting—I see some changes in farm practices with which more and more of us are bound to become involved. I propose to get some fun out of these changes. I believe that making them is sure to keep me more alert, and to keep life on the farm more interesting.

Pen Stables

I have been interested in pen stabling for several years. I went into it before very much was known about how to manage this really very old but in recent years new method of housing cattle.

In the course of learning how to manage pen stabling by the cut and try method, I made some mistakes and got into some difficult situations. For example, I used more bedding than I could afford. I had trouble keeping the watering and feeding areas clean. The stable was too warm.

Then, gradually, those who were in the game learned that we could conserve bedding by paving the watering and feeding areas and scraping them daily, or at least every other day. We discovered that if unpaved areas were set aside for the cows to bed down on, and kept dry and well bedded, the cows would lie down there instead of on the paved floor. We found out that cows like fresh air and sunshine, and do not mind cold. They like to move about and go outdoors at will. So we have opened our pen doors and paved the barnyard.

Finally, as we have worked along with this method of stabling, we have made great savings in labor. For example, our cows at Sunnygables eat the silage off the trailer on which it is loaded out of the trench silo, and practically all of the paved areas are scraped with the tractor. The bedded areas are cleaned by tractor-powered fork; hay is fed only once a day, as is silage; and the loafing area is bedded only two or three times a week.

Of course I don't mean to imply that we have licked all the prob-

lems yet. But by accepting that there might be another way of housing dairy cattle, and trying out a new method, we have made progress. Also, the experience has been interesting.

Underground Silo

I am quite convinced that some silage in the future—not all by any means—will be stored in trench and pit silos. We have now had a season's experience with a trench silo. We know some of the faults of this method of making and storing silage, but next season we will eliminate part of these handicaps, and the next year more of them. Meanwhile, we are not risking any great amount of money.

Long Grass Silage

The use of a pen or trench silo makes possible trying out the making of grass silage from early cut stands of alfalfa clover and grasses without chopping them. I don't know for sure that a good grade of silage can be made in a trench silo out of long grass, but I do regard the idea as worth trying out. Here again the equipment has the advantage of calling for a very minimum of investment, instead of the large amount of money so many changes in farm practice require.

Elevated Milking Stalls

So far as I am concerned, the elevated milking stall is completely proven, and the practices connected with its use satisfactorily worked out. I rather expect that a great many barns in which cows are stanchioned will be equipped eventually with elevated milking stalls at the end nearest the milk house, and the cows released from the stanchions and passed through these stalls for milking. I've had letters from some farmers who are planning on just this sort of an installation.

Already a high percentage of milch cows in the United States are loose stabled in barns or outdoor pens, and it's a sure bet that more and more of these cows will be milked in elevated stalls.

A lot of dairymen, it appears, are getting fed up with the wear and tear of doing push-ups twice a day at the rear ends of a bunch of cows and with marathon walks on hard cement floors, carrying pails of milk to the milk house.

Fixed Box Stalls

The introduction of mechanical barn cleaning, whether by gutter cleaners or tractor-mounted power forks, seems to be challenging the fixed box stall. A lot of us have gotten so old and banged up that the

One of the greatest labor-saving changes at Sunnygables in the past two years has been in the method of serving grass silage to the cows. In 1948 Albert (Boots) Poolevoerde, above, was pleased with the "modern" cart for wheeling the silage to the cows. Today Sunnygables' cows wait on themselves by walking to the low bunk wagons used to bring the silage from the trench.

prospect of mining from one to three feet of hard-trodden litter out of a box stall by hand doesn't appeal to us. It seems much more sensible to build the stall so that a side can be removed and it can be cleaned by a power fork.

Sprinkler Irrigation

I have just finished talking with a man who is looking for a farm. He told me that he would not buy a place which did not have water for irrigation. He said he did not know when he would put in an irrigation system, but he was sure he would want one sooner or later.

Fortunately, ponds can be constructed on most farms if an adequate supply of water isn't already available from lakes or streams. One of the changes that I am confident is ahead for Northeast farming is the irrigation of vegetable crops, pastures, and stands of hay. We don't know much about irrigation in the Northeast yet, but we are due to learn.

Cotton Picker

For a decade, my son has been a cotton grower in the wonderfully fertile Pecos Valley in New Mexico. He has just sold his farm. It is probable that the buyer of it will use it for growing cotton which will be picked by great machines which now cost \$8,500 apiece. The mechanization of cotton picking is driving this crop to big level fields and, in my opinion, permanently dooming the old South as a cotton producer. This is all to the good. As cotton goes out, livestock will come in, and with it an opportunity to build the soil and improve the diet of the people who till it.

FROZEN MILK

I have just read an article suggesting that in the near future fresh milk may be concentrated and frozen. It will then be distributed in the same manner in which frozen concentrated orange juice is now

handled.

I don't know whether there is anything to this prediction or not, but I am pretty certain that in the next few years we shall see methods worked out for preserving the fresh quality of milk and of distributing it which will cut down materially on present handling costs.

Frozen Orange Juice

In Florida, where I am spending the winter, the development of a great business—concentrating and freezing orange juice—is widely credited with having saved the citrus industry of that state. Without question, this development has provided citrus growers with an important new market. The Florida citrus price has also been helped by the freezes in Texas, Arizona, and California, which have eliminated a good deal of competition.

Almost entirely unnoticed, however, is another development which in my opinion has gone far toward making concentrated frozen orange juice a success. It is the production of citrus syrup and dried citrus pulp from cull citrus fruit and from the pulp from which the orange juice has been squeezed. Citrus molasses and pulp production have become a very large business. These products also have become an important factor in the growth of the livestock industry of Florida.

All the roughage many Florida dairies get is dried citrus pulp. The citrus syrup or molasses is now fed free choice to hundreds of thousands of dairy and beef cattle in Florida.

To me, it is significant that it has really taken livestock to underwrite profitable citrus fruit production in Florida. If out of the experience of concentrating, freezing, and distributing orange juice a cheaper method for preserving the qualities of fresh milk and distributing it more cheaply is worked out, the citrus industry will only be repaying the debt it owes to livestock for putting it on its feet.

SERVICE BUREAU

"Good Neighbor" Policy Nets Subscriber Reward

ARMAND ROUTHIER, East Hill, Barre, Vermont, was going home at about 2:00 a.m. when he noticed a car parked along the road and saw a fellow in his neighbor's barn. He drove past, and then turned around and followed the car when it started off. He got the license number, and the incident was reported to the State Police.

It developed that two fellows were stealing chickens and eggs and trying to steal gas from the barn of Robert

Ball of Barre. Lawrence Plante of Barre was arrested and sentenced to the House of Correction in Windsor for eight months to a year by Judge Arthur N. MacLeod. The other fellow is still at large.

Both Routhier and Ball are subscribers to *American Agriculturist*. Mr. Ball wrote us about this, asking that the reward be given to Mr. Routhier. A check for \$25 has been sent Mr. Routhier.

GUILTY ON TWELVE COUNTS

We have just received word that William A. Sayre, who operated mail order cigarette concerns under various trade names at Wilmington, Del., entered a plea of "nolo contendere" (no defense) to 12 mail fraud counts before Chief Judge Paul Leahy in Federal Court at Wilmington on December 21, 1949. Judge Leahy accepted the plea as equivalent to one of "guilty," and Mr. Sayre was sentenced to serve a term of 18 months. This sentence is to run concurrently with the remainder of a sentence imposed on June 13, 1949, in the District of New Jersey, a year and a day in a Federal Penal Institution at Danbury, Conn., from which place he was brought to enter his plea at Wilmington, Del.

Mr. Sayre traded as Allison Tobacco Co., Atlas Sales Co., Popular Mail Service, Rapid Mail Expeditors, and Reliable Mail Order Co. His operations ceased about February 4, 1949; and the Federal District Court of Newark, N. J., appointed a Receiver in Bankruptcy on February 8. A number of *American Agriculturist* subscribers sent money to Allison Tobacco Co. and never re-

ceived the cigarettes they ordered. We advised them to file claims with the Receiver, and the Service Bureau also brought these matters to the attention of the Post Office Department.

— A. A. —

HERE WE GO AGAIN

An agent came to our home and sold us on the idea of a correspondence course. We made a down payment, the balance to be paid by the month. What can you tell us about this school? If it is not on the square, we would like to have you publish it before someone else gets hooked.

So far as our subscriber is concerned, it is a little late to ask for information after he has signed a binding agreement and made a down payment.

So far as warning other subscribers, about what should we warn them? We have already said many times that it is unwise to sign an agreement to take a correspondence course until you have checked on the reliability of the school and until you are sure you have the money, the ability and the perseverance to finish the course.

The school about which our subscriber writes is presumably willing to furnish the course, so we cannot label it a fraud.

THIEVES ADMIT GUILT — SUBSCRIBER GETS CHECK

ABOUT MAY 12 of last year, Arthur Jubert, Route 1, West Chazy, N. Y., reported to the State Police that a yearling Holstein heifer valued at \$125 had been stolen from his pasture. The State Police conducted an investigation and learned that an Essex farmer had purchased such a calf on May 12 at a suspiciously low price.

Mr. Jubert identified the calf as his. Louis Frenyea, 49, and Daniel Pettis, 39, were arraigned before Justice of the Peace Arthur Lewis of the Town of Ausable on charges of grand larceny second degree. They admitted the theft

and sale of the animal, as well as of several other calves in that vicinity earlier in the year.

At the trial, these two men were sentenced to from 2½ to 5 years in prison. Mr. Jubert has been sent an *American Agriculturist* reward check in the amount of \$25 for the part he played in bringing these thieves to justice. Both he and the State Police Bureau of Criminal Investigation are to be congratulated for the good work done on this case. And a big hand to His Honor, the Judge, for handing out a suitable sentence.

Loses Leg in Tractor Accident

John Sliker, Conesus, N. Y., receives check for \$1,000.00 from North American Accident Ins. Co., agent Russ Weinhart

HE WAS driving his tractor along the highway when a car pulled out to pass. Just then another car shot over the crest of the hill. In a last minute attempt to avoid a head-on collision the car tried to get back in line—hooked into the rear of his tractor—tipping it over. Mr. Sliker's right foot was jammed down into the drive wheel — stalling the motor.

When help arrived they tried to get him out but the wheel bolts were rusted fast. Someone suggested an acetylene torch. In a flash Mr. Sliker said, "Nothing doing. There's too much spilled gas around. I don't want to burn alive too."

For more than an hour Mr. Sliker watched the rescue crew work with wrenches and penetrating oil on the rusty bolts. At last the wheel came loose. When they pulled him out, his right leg was so badly crushed and mangled it had to be amputated when he reached the hospital.

After receiving North American check for \$1000.00 from our agent, Russell Weinhart, Mr. Sliker wrote:

"I am a farmer 69 years old. Until last August I had never met with a serious accident. Little did I think when I took out the policy with Mr. Weinhart that I would ever need it. However in less than four months from that date, I was paid for the loss of my right leg because of the tractor accident."

"This has proven to me that one should have North American protection. I urge all farm families to take out a North American policy at their earliest opportunity. Thanks for the \$1000.00 check which Mr. Weinhart delivered to me. It will be a big help to me at this time."

THANKS FROM HAPPY FATHER

"I want to thank you very much for what your wonderful belt has done for my boy. He had a bad rupture. The very day we received the Appliance I put it on and that was the end of my troubles with his pain and crying. He has not worn it for about a year now."—Otto F. Blinn, 1500 N. Church, Belleville, Ill.

SOFT BALL PLAYER A BROOKS BOOSTER

"I ordered an Appliance some time back and it really does the job. I'm 38 years old, weight 200 lbs. Play 3rd base on our Soft Ball team. I really give the belt a real test. Thought I would have to give up my ball playing but not now with your rupture belt. Most people won't believe I have a rupture."—Wilbur Moritz, General Mdsc., Jacob, Ill.

"IT'S TOPS"

"Words cannot express my feeling towards my Appliance. The minute I put it on, my first words were, 'It's Tops!' I hope another who suffers from such agony of a rupture could take my advice and get a Brooks Air Cushion Appliance."—Jack Sonnier, R1, Box 54A, Lafayette, La.

"DID EVERYTHING YOU CLAIMED"

"I am very happy to say that the truss which I purchased from you a little over a year ago did everything you claimed it would do. My rupture does not come down even though I wear the truss only part time. I shall be glad to tell anyone afflicted as I was what your Appliance did for me."—J. G. Rollinger, 242 Arlington Ave., Sarasota, Fla.

"FORGETS HE IS RUPTURED"

"I had this rupture seven years before I knew of your support, and was in the hospital at the time my son ordered the support for me. Until I started wearing your support I had not found anything to help me. Since wearing your support I can do all my work, and can forget that I am ruptured."—G. B. Russell, Box 106, Cherokee, Ala.

State whether for Man ☐ Woman ☐ or Child ☐

Why put up with days . . . months . . . YEARS of discomfort, worry, and fear—if we provide you with the support you want and need? Learn NOW about this perfected truss-invention for most forms of reducible rupture. Surely you keenly desire . . . you eagerly CRAVE to enjoy most of life's activities and pleasures once again. To work . . . to play . . . to live . . . to love . . . with the haunting fear of Rupture lessened in your thoughts! Literally *thousands* of Rupture sufferers have entered this *Kingdom of Paradise Regained* . . . have worn our Appliance without the slightest inconvenience. Perhaps we can do as much for you. Some wise man said, "Nothing is impossible in this world"—and it is true, for where other trusses have failed is where we have had our greatest success in many cases! Even doctors—thousands of them—have ordered for themselves and their patients. Unless your case is absolutely hopeless *do not despair*. The coupon below brings our Free Rupture Book in plain envelope. Send the coupon now.

Patented AIR-CUSHION Support Gives Wonderful Protection

Think of it! Here's a surprising yet simple-acting invention that helps Nature support the weakened muscles gently but securely, day and night. Thousands of grateful letters express heartfelt thanks for relief from pain and worry,—results beyond the expectations of the writers. What is this invention—how does it work? Will it help me? Get the complete, fascinating facts on the Brooks Air-Cushion Appliance—send now for *free* Rupture Book.

Cheap—Sanitary—Comfortable

Rich or poor—ANYONE can afford to buy this remarkable, LOW-PRICED rupture invention! But look out for imitations and counterfeits. The Genuine Brooks Air-Cushion Truss is never sold in stores or by agents. Your Brooks is made up, after your order is received, to fit your particular case. You buy direct at the low "maker-to-user" price. The perfected Brooks is sanitary, lightweight, inconspicuous. Has no hard pads to gouge painfully into the flesh, no stiff, punishing springs, no metal girdle to rust or corrode. It is GUARANTEED to bring you heavenly comfort and security,—or it costs you NOTHING. The Air-Cushion works in its own unique way, softly, silently helping Nature support the weakened muscles. Learn what this marvelous invention may mean to you—send coupon quick!

THE FARM PAPER OF THE NORTHEAST

FLOWERS for Busy People

A FEW WEEKS ago I wrote to several flower seed and plant distributors and asked each of them two questions. First, what are the most popular flowers, judging from your records? Second, what flowers do you consider the most suitable for busy farm women to grow? This article is based on their answers as well as on my own experience and observation.

As it happened, one of the firms I approached does not deal in annual seeds or plants. They specialize in perennials, both flowers and shrubs, and I was much interested in their list of easy-to-grow flowering shrubs. Since the backbone of any garden is its shrubs and perennial flowers, I decided to give you the benefit of their recommendations. You may have some of these specimens already; if not, it is good to remember that a flowering shrub is about the most painless way of getting flowers!

Flowering Shrubs

Althea (*Rose of Sharon*)—Celestial Blue, Snow-drift and Rubis, a deep rose pink flower with deeper center.

Azalea—the Mollis hybrids are very hardy, low-growing and come in a variety of brilliant hues.

Cydonia (*Flowering Quince*)—Stanford Red is a new bright red variety.

Flowering Crabs—varieties floribunda atropur-

purea with red flowers and bronzy foliage; Hopa, with bright pink flowers followed by small red crabapples, and Pink Weeper crab, with drooping branches and crimson-purple flowers.

Mockorange—variety Atlas is a new giant with flowers about as large as dogwood; Belle Etoile, an old one, has fragrant, star-like flowers.

Magnolia Soulangiana (*Saucer Magnolia*)—makes just about the showiest possible small tree in early spring.

Flowering Plum (*Prunus Pissardi veitchi*)—makes a small tree with large double pink blossoms and bronze-colored foliage which turns green in late summer.

Pussy Willow—the French variety—is good for single specimens or for a tall screen or background planting. Branches of these with inch-long silver-pink catkins sell well during winter months in florists' shops.

Tamarix—variety Summer Glow—has lacy, blue-green foliage and wine-red flowers, is especially tolerant to salt air and wind.

Viburnum opulus xanthocarpum (Apricot-fruited cranberry bush)—is said to be hardy as an oak. Its heavily-fruited branches are very decorative, either on the bush or in arrangements.

Lilac—especially the hybrids, with their fine big flower trusses.

Weigela—particularly Bristol Ruby, a fine red,

By GRACE WATKINS HUCKETT

Petunia, FIRE CHIEF, a dwarf red, is the first Gold Medal winner for twelve years in the All-America Selections contest. It is the only flower recommended by them for 1950 introduction.—Photo by Bodger Seeds, Ltd.

and Fairy, a new pink-flowering one.

From my own experience I would urge you to get the best variety you can afford. It may cost a little more in the beginning but it takes no more room and upkeep than the common kinds, and when it blooms it is its own reward.

Roses

I cannot leave the shrubs without mentioning the rose—so many wonderful ones are being developed. Peace, introduced a few years ago, is outstandingly (Continued on Page 27)

Tall double African Giant Marigold, SUN GIANT, is very large, some 4½ inches across. Color varies from pale primrose through yellow and orange. Grows 3 to 3½ feet tall.

SUNNY is a dwarf single French Marigold. It has 2-inch bright yellow flowers on plants that average 18 inches in height. It is valuable for low borders and for cutting.

Zinnia TANGERINE, one of the cut-and-come-again group, has flowers 1½ to 2½ inches across, bushy plants 18 to 24 inches high. Tangerine is bright, lively orange in color.

Sweet Pea CHERRY has delicately beautiful lush pink flowers. Although sweet peas are not rated in the "easy" class, many farm people are very successful with them. —Photos by W. Atlee Burpee

“Good Seed ...

... Means Cheap Feed”

Every Ton of Feed Produced on the Farm is One Less Ton to Buy.

THERE never was a year when a careful job of crop planning and production was more important than it is in 1950. Every additional bushel of grain or bale of hay produced on the farm cuts down the need for purchased feeds.

Quality Seed for Better Crops. Seed is only one of a number of requirements necessary to produce a good crop. However, it is an important factor, for to a great extent, the

quality of the seed purchased determines the crop yield. When based on results obtained, high quality seed is always the cheapest to use.

The cash outlay for good seed required to produce one ton of mixed hay is 75¢ to \$1.00 depending upon seeding rates. The seed cost for one ton of good corn silage is 10¢ to 15¢ depending upon yield and seeding rate.

G.L.F. seed is purchased in the best seed producing Northern states and only seed adapted to Northeastern farms is offered to farmers. All G.L.F. seed is processed in well-equipped plants by trained men and everything possible is done to make sure it will give the best results on your farm.

High Quality—Lower Costs. Low cost procurement is possible in G.L.F. because of the wide coverage of seed areas by G.L.F. seed buyers who know where the best crops are located and buy crops from year to year in large quantities. The economical system set up by farmers to handle feed in G.L.F. is also used to handle seed which eliminates the need for a special retail seed service.

This procurement and distribution system, coupled with thousands of farmers pooling their seed orders through G.L.F., results in the lowest price possible for quality seed.

Seed cars have been rolling toward Service Agencies all over G.L.F. territory. Check with your Agent Buyer or Store Manager about your needs today. He knows G.L.F. seed and because he makes it his business to know local farming conditions, he will be able to help you select the right G.L.F. seed for your farm.

Cooperative G.L.F. Exchange, Inc.
Terrace Hill, Ithaca, N. Y.

This is the year to buy seed early.

Seed markets have been strong, supplies of certain varieties are limited and the demand is high. If you are planning to grow a large amount of your dairy feed, it will be just plain good business to get your seed supply early. You will be protecting yourself in two ways:

1. You will have on hand the amount and variety you want when you want it.
2. You will avoid any further price increases that may come later in the season.

Good Fertilizer goes hand in hand with good seed to produce bigger and better crops. G.L.F. fertilizers are manufactured from the highest quality materials and formulated in accordance with the latest scientific information available.

G.L.F. Seed... The Standard of Quality

New Vegetables Worth Trying

By Paul Work

WHEN NEW vegetable varieties appear, one cannot tell which ones will survive and thrive and which will wither and die under the critical appraisal of farmers' and gardeners' opinions. And a variety may go strong commercially and gain little popularity in home gardens. It may be good early, and not late. It may be a wonder in favorable seasons but a dud when heat and drouth strike. So new offerings must be tried out for your purposes and where you are.

Snap Beans

We have two new bush green snap beans (can you tell me the proper order for those four words?). Both are far ahead of Bountiful and Tendergreen for yield. One of them, **Topcrop**, an All-America Selection, bred by Zau-meyer of the United States Department of Agriculture, is round-podded, longer than Tendergreen, and tops for quality. The other is **Contender**, developed by the late B. L. Wade and his associates, also of the United States Department of Agriculture. It is long podded, not quite round, handsome but not as free of fibre as Topcrop. It seems to stand unfavorable conditions better than most varieties. Both of these carry a very important character—resistance to common bean mosaic and to the "greasy pod" type of virus.

Topcrop is very similar to Rival, which came out last year. All three are well worth trying, comparing these two with Tendergreen and comparing Contender with Black Valentine.

Sweet Corn

Few gardeners have much to say against the table quality of Golden Cross sweet corn, but some growers have turned to varieties such as Lincoln and Lee because they stand heat and drouth better and produce somewhat larger and more handsome ears, even though the quality is somewhat inferior. Now comes **Iochief**, all the way from E. S. Haber of Iowa State, bringing a heavy yield, few suckers, resistance to wind, heat and drouth, plus narrow deep kernels. It is of high quality, though it is hardly up to Golden Cross. These advantages come along with large 14-18 rowed ears, though tip filling was a bit imperfect with us.

Another sweet corn in the main crop group is **Normandie**, with attractive deep-kerneled ears, a little more slender than Golden Cross and of good quality. It is presumed to pass good edible stage more slowly than Golden Cross.

Golden Crown is an improved Golden

Cross which we saw but did not have in our trial.

W. H. Lachman of Massachusetts State has brought out two new sweet corns that look good. **Gold Mine** is as early as any, not very strong in plant but the quality is definitely better than most earlies. Not yet catalogued, a little seed is available for trial. The other is **Golden Jewel**, early as Mar-cross and as good as Carmel Cross. It has been bred for high seedling vigor, favoring good come-up when soil is cold and wet. Seed of this is on the market.

The **Burpeeana** pea is worth trying in the home garden. Maturing with Thomas Laxton, and with a shorter and denser vine, we thought the peas were of rather exceptional quality for fresh use and freezing. Pods are a bit small but well packed. A large percentage of doubles makes for heavy yield.

Early Wonder is a new tomato of Victor-Bounty type and maturity but with heavier foliage to protect from sun-scald.

Watermelons are coming. **New Hampshire Midget** gives us some much-needed improvement over White Mountain and it has been harvested in 70 days from seed. Don't let it get too ripe before you pick it. It is smaller than Honey Cream, red fleshed, and tender-rinded.

We did not have **Northland** in our trial but we saw it and tasted it and we want to grow it again. It looks about like Honey Cream but is red-fleshed and is a true hybrid of high quality.

Other things to try are:

Wisconsin Golden Acre and **Wisconsin Copenhagen** cabbage, especially if fusarium or yellows is troublesome.

Yorkstate Pickling cucumber, where mosaic is a problem.

Lakeland tomato, in the Stokesdale class but with better foliage to protect the fruit.

N. H. 51 lima bean for northern climate.

As always, we do not advise sudden changes in varieties. Try them out first. Your County Agricultural Agent has a list of sources if you live in New York, or you may write to *American Agriculturist*, Cornell Extension Bulletin 782, "Newer Varieties of Vegetables for 1950," is just out and gives more details.

— A. A. —

TO GROW QUALITY LETTUCE

E. J. Fleming of Andalusia, Pa., who grows about 5 acres of lettuce each year, says that his soil is always prepared in the fall. Refuse from the previous crop, which may have been celery or beets, is disked in, leaving the soil coarse. This rots down during the winter months. A topdressing of rotted manure is put on with a spreader while the ground is still frozen.

The seeds are drilled in fairly heavy (12 seeds to the foot) on dry soil February 15 to March 20 with a 4-row seeder 18 inches apart (4 rows to the bed). 800 pounds of 4-12-8 fertilizer are drilled in early on top of the manure mulch before the seeds come up. The plants are hand hoed and thinned 16 inches apart in the row. The plots are cultivated as needed with 6-inch Texas sweeps.

— A. A. —

Green lima beans, sweet potatoes, corn, and green peas are the fresh vegetables highest in calories.

Maurice Whitney, dairy farmer, says:

"Every pipeful of Prince Albert is real smoking joy!"

"I GET COMPLETE SMOKING JOY IN A PIPEFUL OF PRINCE ALBERT. CRIMP CUT P.A. IS RICH-TASTING, REAL EASY ON MY TONGUE."

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

● Prince Albert's choice, naturally mild tobacco is specially treated to insure against tongue bite. Crimp cut P.A. packs right, burns right and smokes right! Prince Albert is the big favorite with pipe smokers.

THE EDITORIAL PAGE

YOU CAN EAT THE BEST

FARMERS can be the best fed folks in America, but it takes some planning and doing, and now is the time to start.

Consider first the possibility of growing small fruits. For years I have had more of several kinds of berries than we can use, and they have required comparatively little work. If you want to go a little further, most farms will grow the small tree fruits. But there's no use planting the trees unless you are resolved to give them good care, and that includes adequate spraying.

For many years, also, we have had about every variety of vegetable that can be grown in this climate, and during the last several years we have these vegetables fresh the year round with the use of a freezer. In fact, we have two freezers: one large and one small. Not even the refrigerator has added more to our good living than have these freezers. No one can tell me that you can buy stuff out of stores just as good and save all the work! It is impossible to buy most vegetables as fresh and high in quality as they can be grown in a well cared for garden. And with a freezer it is possible to have meat better than you can get out of most markets. Only last night at home I remarked how difficult it would be if we had to go back to store meat again after living for years on our home-grown fat steers.

Last but not least, farmers can top off their home-grown fruit and vegetables with plenty of milk and poultry products, which you sell to yourself at a wholesale rate instead of paying the retail prices for them. A quart of milk a day for every member of the family is none too much to keep bones and health good.

Unfortunately, prices of farm products are down, but these products are worth just as much to eat as when they cost much more. Why not treat yourself and your family to the health and happiness that comes from the good eating possible on every farm?

USE OF GASOLINE DOUBLED

IN 1939, farmers of New York State in their cars, tractors and other gasoline engines used, in round figures, 24 million gallons of gasoline. In 1949, or only 10 years later, they used 50 million gallons, or twice as much. Thus rapidly have horses disappeared and the farms become almost completely mechanized.

Many of us have seen the power on farms change from horse power to gasoline, the change from the horse and buggy age to the automobile and tractor age. It is interesting to speculate on how many living now will live to see the equally tremendous changes in our social and economic life which will surely result when we pass from the gasoline age to some other kind of power, possibly atomic power.

GOOD WORK

THE GOOD WORK of Agricultural Missions, Inc., should be better known, appreciated, and supported. It is an independent, non-denominational organization working closely, without duplication, with mission boards of all denominations. It was organized in 1930 by a group of laymen and mission board executives, led by Dr. John R. Mott, to give greater emphasis to the work of rural missions throughout the world, and to assist the various mission boards in developing this phase of missionary effort.

Under the auspices of Agricultural Missions, schools and colleges have regular courses for the training of new missionaries and to bring furloughed missionaries up to date with the latest information. At Cornell University, for instance, two courses are given: a one-year course for missionaries preparing for the field or doing post-graduate work, and a month's course for those on furlough, given in January of each year.

To carry on the good work of Agricultural Missions a postwar program for strengthening and en-

By E. R. Eastman

larging its services was adopted in 1945, with a budget of \$250,000 to be raised during the succeeding five-year period. To date, \$215,000 of the budget has been raised, the money coming from outstanding and generous laymen, mission boards, and many churches.

Ask your pastor how you can help.

FARMERS USING MORE FERTILIZER

WHEN I WAS A BOY, a wise old farmer once said to me that the combined judgment or conclusions of many farmers are the safest guide there is. Judging by the increased use of commercial fertilizers, farmers have concluded that it pays, and pays well.

Last year farmers bought 18 million tons, or about 2½ times more than they were buying annually before the war. And not only are they buying fertilizer in larger quantities but they are using it much more efficiently. Farmers have found that wrong application of commercial fertilizer or the wrong kinds or amounts for different crops can result in huge losses. Therefore, it pays to know all the different methods of applying fertilizer and your various soil and crop needs. Then you are reasonably safe in using it in large quantities.

By the way, are your fertilizer supplies on hand? It is wintry as I look out of the window this late February morning, but the days are growing rapidly longer and before you know it you will be up to your neck in field operations. It pays to get your supplies on hand.

FUN WITH BEES

IMPORTANT as is the honey bee's production of 200,000,000 pounds of honey annually, few realize that the honey bee is even more important because of pollination of plants. Not only is the bee necessary to the apple producer, but the Department of Agriculture points out that the bee is highly important to about fifty other crops.

Want to have a little fun? Study up about bees and get two or three hives and swarms. Bulletins and instructions can be had from most colleges of agriculture and from the U. S. Department of Agriculture.

WOULD SAVE \$62,500 IN ONE COUNTY ALONE

FOR several years *American Agriculturist* has been trying to find ways and means to extend the productive life of dairy cows, and among other things has secured and printed many letters from dairymen describing their long-lived cows and giving their reasons why they thought these cows lived long and produced well.

Now along comes my friend, Harry Morse, long-time county agent of Tompkins County, New York, with figures to show that if the average productive life of the cows in Tompkins County could be increased just one year, say from five to six years, it would save dairymen of this one county \$62,500 a year. If cows could live and produce well one year longer, New York farmers could relieve themselves of raising and buying 50,000 cows a year. Multiply the costs of those replacements in one state by those in every state, and you have a stupendous figure that shows one of the chief reasons for the high costs of milk production.

Now, there are ways to cut down these ruinous replacement costs which we are rapidly learning. The chief one is better disease control. We have TB under control, and we are getting more and more information about the control of Bang's and mastitis. Calfhood vaccination is now an accepted practice, and there are programs in most states for controlling mastitis.

Dairymen increase the productive life of their

stock by raising their own replacements and feeding the calves well so that they get a good start. Of course, the bulls are an important factor, not only for production but for their ability to transmit longevity characteristics. And last but by no means least is the right kind of a feeding program. You may think you are feeding your cows right—and at the same time they may be starving for lack of some necessary ingredient.

In short, your best bet for reducing your costs of milk production is to increase the length of time of highest production of your cows.

WHAT DO YOU THINK OF ROADSIDE STANDS?

JIM HALL of our editorial staff says that more and more farmers are going to find different ways of getting closer to consumers, and that one way to do this is to build a good roadside market. I agree, but I want to emphasize that word "good". Too many roadside farm stands and the produce they contain are unattractive and injure the whole roadside stand business.

But if a farm is situated right and the stand and products are made attractive, I am sure that roadside marketing offers many farmers an opportunity to increase their farm income. What do you think?

For the best letter written from actual experience in operating a real farmer's roadside stand, we will pay \$3.00, with \$1 each for any other letters on this subject which we can find room to print. Address your letter to *American Agriculturist*, Department RS, Savings Bank Building, Ithaca, N. Y., and have it in our office not later than April 15.

EASTMAN'S CHESTNUT

IHAVE just been having fun reading *The Autobiography of Will Rogers*. America lost a great humorist when Will met an untimely death some years ago in the crash of an airplane.

I was particularly tickled in reading Will's speech to the annual meeting of corset manufacturers, sometime in the 1920's, in which he said in part:

"These Corset Builders are a tremendous aid to the Eyesight . . . The same problem confronts them that does the people that run the Subways in New York City. They both have to get so many pounds of human flesh into a given radius. The subway does it by having strong men push and shove until they can just close the door with only the last man's foot out. But the Corset Carpenters arrive at the same thing by a series of strings . . .

"Now the Front Lace can be operated by judiciously holding your breath and with a conservative intake on the Diaphragm you arrange yourself inside this. Then you tie the strings to the door knob and slowly back away. When your speedometer says you have arrived at exactly 36, why, haul in your lines and tie off.

"We have also the Side Lace that is made in case you are very fleshy, and need two accomplices to help you congregate yourself. You stand in the middle and they pull from both sides. This acts something in the nature of a vise. This style has been known to operate so successfully that the victims' buttons have popped off their shoes.

"Of course, the fear of every fleshy Lady is the broken Corset String. I sat next to a catastrophe of this nature once. We didn't know it at first, the deluge seemed so gradual, till finally the Gentleman on the opposite side of her and myself were gradually pushed off our Chairs. To show you what a wonderful thing this Corseting is, that Lady had come to the Dinner before the broken string episode in a small Roadster. She was delivered home in a Bus . . .

"Men have gone down in History for shaping the destinies of Nations, but I tell you this set of Corset Architects shape the Destinies of Women and that is a lot more important than some of the shaping that has been done on a lot of Nations that I could name off hand."

AA's Farmers' Dollar Guide

MILK: The January uniform price of milk to dairymen delivering to the New York market was \$3.91. Last month it was \$4.26 and in January a year ago it was \$4.84. Production of milk shipped to New York was up 22.4%, due to a record-breaking production and a 10% increase in producers shipping to New York.

LIVESTOCK: January 1 showed the following increases in U. S. livestock population, compared to a year earlier: hogs, 6%; beef cows, 5%; dairy cows, 1%; chickens, 7% (pullet numbers up 12%; old hens down 2%). Sheep were down (2%)—also horses and mules.

FARM MORTGAGES: U. S. farm mortgage debt is now at \$5,450,-000,000, 7% above a year ago and 16% above the low point on January 1, 1946.

Farm assets declined during 1949 for the first time since the war began. January 1 estimate was reduction of \$5,000,000,000 from the peak of \$127,-000,000,000 on January 1, 1949. Farm real estate price is trending down. If you buy farm land now, consider the price carefully and give more attention to buying land of top fertility. Relationship of prices received by farmers to those paid by farmers is now below 100, compared to 1910-14. Condition comes because the prices farmers received have dropped faster than prices of the things farmers buy. However, farmers would be relatively happy if they could be sure this situation would get no worse.

GRAIN TOO HIGH: In a telegram to U. S. Senators and Congressmen from New York Jim McConnell, General Manager of GLF, demanded "immediate Congressional action to lower grain support prices to 75% of parity or to a point that will unlock vast supplies of stored grain." Mr. McConnell said that Northeastern farmers are receiving 20% less for milk and 33% less for eggs than a year ago, while corn, held up by 90% of parity price supports, had declined only 8%.

FARM ORGANIZATIONS: Stung by "straight-from-the-shoulder" talk of American Farm Bureau Federation President Allan Kline, Secretary of Agriculture Brannan gives indication that he is "after Kline's scalp." Gossip indicates belief by Brannan that Farm Bureau members will not back Kline's fight against the Brannan Plan, and that Grange members will not back National Master Goss. It will be too bad for agriculture if Brannan is right. Never has there been a time when unity among farm organizations was so important.

POTATOES: The potato support price for 1950 (National average) has been set at \$1.01 a bushel, which is 60% of parity. Apparent necessity of dumping potatoes now owned by the government is making headlines and will continue to do so. Speaking plainly, setting of supports in previous years at levels that encouraged production above demand has given tremendous black eye to all agriculture. Next year, spotlight will be turned on wheat. Present prediction for 1950 crop and close estimates of all types of demand indicate that carryover into the 1951 market season will be 100 million bushels bigger than carryover into the 1950 market season.

POULTRY: While present egg price situation is very discouraging to poultrymen, there are signs that there will be marked improvement next fall. This indicates wisdom of buying the normal number of baby chicks and cutting corners, if necessary, by selling old hens.—H. L. Cosline

SUPPLIES: We have mentioned before, and we do so again for emphasis, that there will be shortages and delays later in the spring if you wait to buy fertilizer and seeds, particularly grass and clover seed. Get your grass and clover seed now!

MECHANIZATION: Back in 1850 the average power to run a farm came from these sources: man's muscle, 15%; farm animals, 79%; machines, 6%. Now man contributes 4%; farm animals, 4%; machines, 92%.

The Song of the Lazy Farmer

of dawn to wear out both brain and brawn. I never heard of any war that started at a kitchen door between two fellows full of pie who only want soft spots to lie.

IF YOU don't think humanity is just as queer as it can be, just read your daily paper thru and see the crazy things folks do. Seems ev'ryone is worrying for fear some new and awful thing, like atom bomb or dread disease, will kill them sooner than they please. And still, if what I read is so, them folks are rushing to and fro a-meetin' death in accidents because they do not drive with sense; or else they take a slug of pills to cure imaginary ills, then slam around the whole darn night and wonder why they don't feel right.

Why should we do things in a rush, with sweaty brow and face that's flush? It seems to me the world's berserk, the way most people like to work and stew and fret until they're sick, no wonder ulcers are so thick. There's nothin' ails the world today that can't be treated best my way, if ev'ryone would just slow down and not go runnin' off to town or get up at the crack

IRON AGE

Vegetable Planters and Transplanters

with exclusive **BAND-WAY**

assure you **BIGGER YIELDS**

GREATER YIELDS

with **IRON AGE** Vegetable Planter

Large and small growers of beans, corn, peas, cotton and other crops all agree—Farquhar Iron Age Vegetable Planters give them better stands, bigger yields than any other planter they ever used. "I planted 325 acres of beans, cucumbers and cantaloupes with my Iron Age Vegetable Planter . . . have sturdier plants . . . get greater yields . . . with less wasted fertilizer!" says one enthusiastic grower. There's good reason for this money-making

Iron Age performance . . . it's exclusive Band-Way, the scientific method of culture that makes up the bed, places the fertilizer at the exact point where it does most good, plants and covers the seed in *one quick, accurate operation!* Band-Way planting stops fertilizer injury, leaching, fixation, burning . . . uses *less* fertilizer *more* effectively! Iron Age feed and placement mechanism assures more accurate planting, too!

BETTER STANDS

with **IRON AGE** Transplanter

Iron Age Transplanters, also with exclusive Band-Way, apply water and fertilizer *in one operation* at the time young plants are set. Plant food is scientifically placed at *exactly* the right distance and quantity to bring each plant to a healthy, productive maturity!

IRON AGE Row Crop Sprayer

Complete line of Iron Age High Pressure Sprayers for every row crop application insures complete penetration, maximum coverage, lower spraying costs. Famous Iron Age Pump maintains high pressures, gives dependable, economical service season after season without breakdowns.

COMPLETE CROP PROTECTION

PLANT AND SPRAY THE IRON AGE WAY

NEW HYDRAULIC CONTROL FOR ALL CASE TRACTORS

Saves Time in Spring Work

DISKING....

Non-stop disking is easier than ever with hydraulic control. Full speed or standing still, a touch of a little lever angles, straightens or adjusts the gangs. The new Case "RH" Soil Conservation harrow, shown with 2-plow "SC" tractor, "follows" better on contour curves.

PLOWING....

New Eagle Hitch with new hydraulic control on the low-cost Case "VAC" tractor hooks up to "latch-on" mounted plow in one minute, from tractor seat. There are also two-way moldboard plows, disk plows, field tillers—all built for "latch-on" hook-up with Eagle Hitch.

DRILLING....

New Low-wheel grain drills, shown with 3-plow "DC" tractor, are easier to fill. When fitted for portable cylinder, they lift, lower and adjust working depth with a touch of the little lever on tractor. Amazingly accurate Seed-meter saves seed, brings more uniform stands.

PLANTING....

New Masterframe for "VAC" tractor is stronger, simpler — gives hydraulic lift to front-mounted planters as well as "look-ahead" cultivators. The Case line includes planters for every crop system including rear-mounted narrow-row planters for closely spaced vegetable crops.

● See for yourself how simple, how strong, how sure-acting a hydraulic control can be. Drop in at your Case dealer's — try your hand at raising, lowering and setting implements with a touch of the one little lever. See how much more hydraulic control means with the extra speed and convenience of a Case tractor. And remember—there are twenty models of Case tractors in four sizes. Among them is exactly the size and type that fits your farming. Get latest information — use the coupon, today.

CASE

Mark machines that interest you, write in margin any others you may need, mail to J. I. Case Co., Dept. C-11, Racine, Wis.

Fifty Years Have Brought Changes in Apple Growing

By E. STUART HUBBARD

President, New York State Horticultural Society

AS I LOOK back over fifty years of pruning, it is interesting to note how our methods and plans of pruning have adjusted themselves to the varying conditions of equipment, insects, labor, type of fruit in demand, and fertility.

At the turn of the century, the sky was the limit for the height of apple trees. There was little or no spraying done. By standing on the tank on a hand pump wagon outfit and balancing a twelve foot pole on one's palm, the fine mist from two Vermont nozzles could be floated into the top of a thirty-foot tree fairly well.

Then came San Jose Scale, requiring complete covering of all the bark of all the twigs with spray drifted through the tree by opposite winds at dormant time. Ease and speed in covering demanded that trees be lowered to not over twenty-five feet. Pruning then consisted of keeping the up-growing leaders cut to the desired level and removing broken and dead branches and those that were so shaded as to have little vigor.

Nitrogen was supplied by absolutely clean tillage, burning up the humus accumulation of years of animal husbandry and of the cover crops sown in June. Branches were allowed to droop to the ground. Insects were few. Curculio and maggot were kept down by clean tillage and picking up cider apples, later by one arsenic spray; and codling moth was controlled satisfactorily by one calyx spray. Most varieties were immune to scab on good elevations and exposures.

More Problems

Then came McIntosh with its greater scab problem and a consumer demand for more perfect, better-colored eating apples. Codling moth grew resistant to arsenate of lead. With soil depletion came the use of nitrates and mass attacks of aphids, red bugs and leaf hoppers. Spraying several times during the season from inside the trees as well as outside, made possible by power rigs and the new spray guns, required removal of lowest branches and the highest tops and thinning out thick interfering branches. An unbroken umbrella of outside bearing wood in sunlight was desired, as fruit was covered with spray by both outside and inside applications.

The use of efficient miticides and dormant aphid sprays and a change to

sod, mulch and manure have simplified the control of sucking insects, while more powerful pumps or wind blown sprays have made possible driving the spray through the tree so as to cover all leaf and fruit surfaces if there are openings in the umbrella covering of the leaf surface.

Lower Trees

The pruner now seeks to limit the height of the tree to not over twenty-two feet, both to permit spray covering from the passing blast and for easy picking with shorter ladders by the novices who must pick our trees. He removes the small branches that have borne and droop from the underside of the limbs, also the drooping ends of the limbs so that the spray blast can drive horizontally and diagonally upward to the far side of the tree and up through the top.

The dominant up-growing leaders on the top of the tree or on top of the limbs are removed, leaving branches which incline outwards and can bend with fruit. Cross branches that may interfere with ladder setting or the passage of light and spray are removed. The upper shoulders of the trees that may shade the lower branches of adjacent trees are kept down. Where trees have reached full size for the ground occupied, it is realized that pruning may restrict the dimensions of the tree and its leaf surface to the available sunlight and root space.

A Job for An Expert

And so we strive to have our apples grow in sunlight on strong new wood, on branches kept short enough so that less propping is needed, with ends that do not droop so as to close the openings through which the later sprays must pass. We must keep the trees low to permit the use of short ladders, and branched to permit setting ladders between long branches which cannot be permitted to droop into grass or weeds for easy passage of two spotted mites or to prevent spray covering for red banded leaf roller.

Pruning by ideal charted systems regardless of the changing factors of type of fruit desired, available labor and equipment and the pests we must control is impractical. One must truly be a horticulturist if he is able to integrate successfully all the changing factors which affect the production of perfect fruit.

This is the old Sutton homestead near Windham, Greene County, New York. Mr. Claude Sutton represents the third generation to live on the farm which he works with the help of a daughter, a grandson and another daughter who keeps house. Recently, Mr. Sutton, on his 72nd birthday, had a picture taken with eleven of his fourteen grandchildren, all of whom live on farms.

"I am the grass... let me work"

Let me work the miracle of changing soil and water, sunlight and air into a living, growing plant. Let my roots reach into the good earth to gather calcium, phosphorus, other minerals and nutrients. Let me store these growth elements in my leaves and stalks. Thus I become the source and supply of food for livestock. When eaten by grazing animals I become bone and flesh, hide and wool. I become meat and milk, man's finest protein foods... foods that develop the body and mind of man... that contribute greatly to the energy, initiative and wealth of America. Let me work on the 779 million acres of America's grassland... much of it land that can produce little else of food value.

In the expansion of our livestock-grass economy lies a hope for an adequate meat diet for our growing population. Through meat animals you can utilize grass and roughages to create quality protein foods for human use... and 80 per cent of the growth elements in grass that is grazed is returned to the soil as manure. Grass also works to increase food production in other ways. It protects our productive topsoil from wind and water erosion... holds moisture in the soil... helps restore and maintain organic matter. Grass works to keep America fertile.

To increase the amount of grass and numbers

of livestock is a problem. But it can be done. More and more livestock producers are finding that it pays to pay attention to their grass. There are farmers and ranchers who are producing 400 to 600 pounds of beef per acre on good grass alone. Hog raisers are finding that good alfalfa or rye pasture is worth \$50 an acre, and more, in other feeds saved. The same with sheepmen. Dairy farmers find that grass can be worth up to \$169 an acre to them. It is roughly estimated that the value of the grass that goes into the production of meat and dairy products is close to \$5 billion a year. County agents, experiment stations, conservationists and colleges are doing great work in improving grasses and grass management practices. They can help you make more from your grass, no matter where you live.

Again I say—I am the grass, let me work. But give me a helping hand. Let me grow in place of worthless weeds and brush... on land that never should be cropped. Put me back on land that never should have seen the plow. Give me lime, fertilizer, water and care, and I will work hard for you. Let me work for you as your humble but mighty friend.

"The Meat Team"

Nation-wide meat packers make it possible for all kinds of meats to be available at most any point in the United States. Every housewife in almost every city, town and village in the nation can buy the kind of meat she wants whenever she wants it.

So, from the retailer who sells meat to the consumer, all the way along the line to the hands who round up the cattle, every task of the livestock and meat-packing industry is geared to move meat quickly, efficiently and continuously over its average travel of more than a thousand miles.

So long as the United States is a country of such vast distances, large meat-packing concerns will be needed to do the job of bringing producers of livestock and consumers of meat together.

So that livestock can always be marketed—so that people everywhere can get the kind of meat they want, when they want it—the men and women in the livestock-meat industry work to feed our nation well.

Martha Logan's Recipe for

HAM SCRAPPLE

(Yield: 6 servings)

2 cups ground smoked ham	2½ cups boiling water
1 cup corn meal	½ cup milk
1 tablespoon sugar	1½ tsp. prepared mustard
½ teaspoon salt	Shortening or ham drippings

Mix together corn meal, sugar, and salt. Add slowly to boiling water and milk. Cook slowly in heavy pan, stirring occasionally, about 20 minutes. Add ham and mustard and mix well. Pack into loaf pan. Chill. When cold and firm, slice in 1-inch slices. Fry slices in quick-mix-type shortening or drippings until brown on each side.

OUR CITY COUSIN

At our local livestock sale
City Cousin turned quite pale
Because, you see, he scratched his ear
And right then—he owned a steer!

E. F. Ferrin

TREATED SEED OATS ARE POISONOUS TO HOGS

by E. F. Ferrin

University of Minnesota
St. Paul, Minn.

Surplus seed grains which have been treated with a fungicide may be a dangerous feed for livestock.

Oats treated with Ceresan M. were fed to growing pigs at the Minnesota Experiment Station. Pigs were fed only treated oats and water. The grain was not palatable and the amount of oats eaten for a week or 10 days was less than that of untreated oats consumed by similar pigs. After 10 days of feeding, the pigs ate little of the treated oats, lost weight, and from 15 to 20 days after the start of feeding, became sick. The first symptom was a weak and unsteady gait followed by scouring and vomiting. Some of the pigs seemed to become dizzy and turned circles in the pens. They usually became blind and paralyzed before dying. All of the pigs fed treated oats died except two, which were kept on this feed only 10 days. The deaths from mercury poisoning occurred at from 25 to 31 days after starting to feed the treated oats.

To see if it is worth while to try to salvage treated seed oats, they were mixed with good feeds at the rate of 15% in one case and 30% in another. The pigs did not show symptoms of poisoning. But they gained weight so slowly, and required so much feed, that it was an expensive method of feeding.

RECOMMENDATION No. 1: Never force pigs to eat such grain. It is cheaper to burn it.

RECOMMENDATION No. 2: Always inform a prospective buyer of seed grain if it has been treated with a fungicide.

Quote of the Month

"A nation with a growing population and the task of selling its philosophy of free enterprise to the rest of the world cannot afford to eat at the expense of its soil. Mere soil conservation is not enough for America. We must actually increase the productivity of our land."

H. E. Babcock

Soda Bill Sez:

I'd rather make a living on my own hook,
than hook the taxpayers for my living.

BIG does not mean BAD

It takes a big ship to carry a big cargo. It takes a big locomotive to pull a heavy train. It takes a big industry like yours and mine to do the big job of feeding America and a lot of the rest of the world. It takes big companies as well as little ones to keep that industry operating efficiently.

I firmly believe that the nation needs nation-wide meat packers, such as Swift & Company. The continuous research and education, and the complete utilization of by-products, which our size makes possible, are valuable services to the nation and its people. We help to bring the advantage of a nation-wide demand to livestock producers. We help to provide consumers everywhere with the kinds of meat they want.

Our industry is highly competitive. There are 4,000 meat packers, and over 14,000 other commercial slaughterers of livestock. We must buy our animals in competition with all those other buyers. In the face of this competition, the only way we can stay in business is by efficient operation. We must keep our costs down. This efficient operation and economy of mass production lets more people eat more meat oftener.

I am sure that American agriculture, of which we are a part, can meet the needs of our growing population which wants and should have improved diets.

But we shall meet these demands only if we continue to nurture and encourage enterprise, ambition, and success. Only if we have the faith and courage to work and fight to create our own success. Let us, then, be careful not to confuse the issues. Let us condemn and eradicate evil practices wherever we find them, whether in big industries or small. But let us, and all Americans, realize the danger before we attack enterprise and success—lest we destroy not only the industry and civilization we have created, but also the hope and the heritage of our world for generations to come.

***The above message is from the speech of our President, Mr. John Holmes, before the American National Live Stock Association at Miami. I have quoted it here because I believe that it will be interesting and encouraging to the millions of livestock producers who were not able to be at the convention.

F. M. Simpson.

Nutrition is our business—and yours

Sez Zeke: "With my new tractor, hard work is no strain . . .
I got it with money BLENN made on my grain."

New Process
Blenn
Swift's
Specialized Crop Maker

Sure enough, Zeke, you need high-yielding, money-making crops to buy all the equipment a modern farmer needs. And there's one sure way of growing more corn or other grains per acre, at less cost per bushel. Use New Process BLENN, Swift's specialized crop maker.

What do we mean by "New Process"? Just this: we are always looking for ways to make Swift's Plant Foods better. After years of research and testing we have perfected an exclusive method of manufacture. BLENN now gets complete mechanical mixing followed by complete chemical processing.

What does that do? It makes BLENN, like all Swift's Plant Foods, uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform freedom from caking, lumping, bridging; 3) uniform distribution through your machines; 4) uniform feeding of your crop throughout the entire growing season.

Growers report greatly increased yields of better grading corn and other grain where BLENN is used. It promotes strong root systems, stiff stalks, long, well-filled heads or ears, and uniform early ripening. These add up to bigger yields, higher cash returns per acre.

To be sure of your supply, see your Authorized Swift Agent today and order BLENN, Swift's specialized crop maker.

SWIFT & COMPANY

Plant Food Division
Chicago 9, Ill.

Buy at the sign of the RED STEER

A Good Steer

There was a story in the papers recently. It quoted an Illinois farmer as saying: "To get enough feed from the average unfertilized pasture, a cow should have an 18-inch mouth, a set of roller skates, and a grazing speed of 15 miles an hour."

Maybe that's right. But we think you'd do better to spread a little BLENN on the pasture. You'll get more and better quality grass—more milk and meat pounds, too.

BLENN is made to give growing crops the needed balance of growth elements all through the season.

* * *

Most of us like to "top" the other man's story. We wonder if you can top the results from using BLENN reported by this grain grower . . .

"In 15 years of farming I have used many plant foods. Last year I found the answer to my plant food 'wants' . . . Swift's BLENN increased my yields by 10% per acre. Such an increase is high, as I have always followed good cultural practices. It's proof to me that BLENN is a superior plant food for grain."

Leon Hill, Sandy Lake, Pa.

* * *

FREE! We have a 16-page booklet about BLENN. It is interesting reading and profitable. We will be glad to send your copy along anytime you ask for it. Just write to Plant Food Division, Swift & Company, Chicago 9, Illinois.

Fertilizing Pastures and Hayfields

By George Serviss

COWS FEED every day—in fact, must be fed every day to maintain a decent level of milk production. Plants also feed every day when they are in the growing stage, and when their food supply runs out they quit producing the same as cows quit milking.

The cow must be fed a diet of water, carbohydrates, protein, minerals and certain vitamins. Plants need water, nitrogen, minerals and carbon dioxide. Plants manufacture their own carbohydrate requirements from carbon dioxide and water if the other things needed are also present. Plants also synthesize their own protein from the carbohydrates present in the plant and nitrogen absorbed from the soil. Although plants do not absorb nitrogen directly from the air, many leguminous plants do obtain a large part of their nitrogen indirectly from the air through the nitrogen-fixing bacteria that live in the nodules on their roots.

Feeding plants is not a great deal different from feeding livestock, if we think of the soil as the roughage supply and fertilizer plus manure as the grain ration. Certain crops will require a somewhat different ration (fertilizer) than others, and the same is true for different kinds of livestock. The basic feed for cows is roughage (hay, silage, pasture). Good roughage may contain almost all of everything that an average cow needs, though it is seldom wise to feed a very high-producing cow on roughage alone for any length of time. Poor roughage, on the other hand, is deficient in most of the essential nutritive factors and, in fact, may be deficient in everything.

How Soils Vary

Soils vary in the same manner as roughage: On some of our best Northeastern soils a light fertilizer and lime diet is all that is needed to produce good average yields of hay and pasture, but for top yields heavier feeding is required. Many soils, however, as suppliers of the essential elements for plant growth, are not much better than oat straw is as a roughage for dairy cows. When you feed poor roughage to cows, you must feed a good dairy ration very liberally to maintain production. The same is true with many of our soils; you must fertilize them heavily to obtain good yields of high quality roughage. They just do not have the inherent ability to supply adequate

quantities of the essential plant nutrients. Most of these soils do respond well to applications of lime and fertilizer, providing they are reasonably well drained and have sufficient depth to provide an adequate reservoir for water and plant nutrients.

The major deficiencies of Northeastern soils in the order of importance may be ranked as follows: nitrogen, lime, phosphorus and potash. But if we rank them in the order of their need in an economical fertilization program for hay and pasture crops, we arrive at the following order: lime, phosphorus, potash and nitrogen. These rankings are general and do not fit every field. For instance, we have some soils that do not need lime; also, there are soils today where potash is a more limiting factor than phosphorus. There are situations, too, where some of the minor elements—particularly boron—should be included.

Some will question listing nitrogen first as a soil deficiency and listing it last in a fertilization program for hay and pasture. It is not listed last to convey the idea that it should usually be dispensed with, but to emphasize the well-established fact that if the lime, phosphorus and potash needs are taken care of so that the more desirable hay and pasture legumes may be grown and the manure returned to the land, a large part of the nitrogen needs are automatically taken care of. There are plenty of places on the average dairy farm where nitrogen can be used with profit, however.

Know Your Soil and Crops

In planning a fertilization program for hay and pasture land on a dairy farm, there are two requirements: first, know your soil; second, know your crops.

Does your soil need lime? This and the amount that might be needed can be determined quite accurately and cheaply by a soil test. County agricultural agents generally are glad to provide this service. Next, what about potash? Soils differ quite markedly in their ability to supply this element. The appearance of last year's clover or alfalfa crop is a good guide. A potash shortage of any magnitude leaves definite clues. These clues are numerous small white dots around the margins of the leaves. Whenever afflicted plants can be easily spotted, it is a safe bet

(Continued on Page 13)

FERTILIZER RECOMMENDATIONS FOR HAY AND PASTURE

	New Jersey	New York	Penna.	Vermont
New hay and pasture seedings with small grain	300 lbs. of 0-20-20 in addition to usual small grain fertilizer	350 lbs. of 6-12-6 or 300 lbs. of 0-20-20	250 lbs. of 0-20-0 or 250 lbs. of 0-20-20 or 300 lbs. of 4-12-8	600 lbs. of 0-20-20 or 500 lbs. of 5-15-15
New hay and pasture seedings clear	500 lbs. to 1000 lbs. of 5-10-10	300 lbs. of 0-20-20	400 lbs. of 0-20-20 or 500 lbs. of 4-12-8	600 lbs. of 0-20-20 or 500 lbs. of 5-15-15
Top dressing established alfalfa, ladino clover, etc., over 50% legumes	400 lbs. to 500 lbs. of 0-19-19 plus borax*	Superphosphated manure or 150 lbs. of 0-20-20	400 lbs. of 0-20-20 or 0-19-19 plus borax* or Superphosphated manure	600 lbs. of 0-20-20
Top dressing established alfalfa, ladino clover, etc., less than 50% legumes	500 lbs. to 800 lbs. of 5-10-10	Superphosphated manure or 200 lbs. to 300 lbs. of 10-10-10		600 lbs. of 5-10-10

Permanent Blue-grass pasture stimulation of early growth and for top dressing timothy	500 lbs. of 7-7-7	300 lbs. of 10-10-10 or 100 lbs. of ammonium nitrate	300 lbs. to 400 lbs. of 10-10-10 or 100 lbs. of ammonium nitrate	400 lbs. of 10-10-10

* Use 0-19-19 plus borax or another analysis of the same ratio where boron is suspected to be deficient.

FASTEST GROWTH EVER

◀ FROM THIS TO THIS
IN ONLY 5 WEEKS ▶

proved by 101 million chicks on PURINA STARTENA CHECKER-ETTS

Last year poultrymen raising 101 million chicks placed a tremendous stamp of approval on a sensational new starting feed — PURINA STARTENA CHECKER-ETTS. Thousands of reports quote these *improved results* — even over Startena mash of former years:

...“by far the fastest growth I ever had”

...“unusually high livability”

...“chicks liked them better”
...“less waste from feeders”

Yes, results were so good that one out of every 10 production chicks in all U. S. and Canada were fed on Checker-Etts. Your chicks, too, can benefit from the extra-fast start Checker-Etts give. Be sure to order some — only 2 pounds per chick. And, remember, your Purina Dealer can also supply you with *top-quality* chicks.

RALSTON PURINA COMPANY • Buffalo, N. Y. • St. Johnsbury, Vt. • Wilmington, Del.

“In 4 weeks I lost only 42 chicks of 1,552 started — 97.2% livability. Average weight was over 1 lb.”
— HAROLD LEONARD, BINGHAMTON, N. Y.

“Last year my 2,000 chicks on Checker-Etts ate better, grew faster and wasted less feed than formerly on mash.”
— GEO. W. DAVIS, CHESTNUT HILL, CONN.

“Never had finer, sturdier chicks. At 5 weeks they were 2-3 ounces heavier than any I have grown on mash.”
— HALL BROTHERS, ALPINE, N. Y.

“The chicks I started on Checker-Etts last year were most economical ever. Wasted less feed — grew faster.”
— BILL SCHULTZ, KUTZTOWN, PA.

I DARE YOU!

Ladder of Success

I wish I could illustrate in this column the ladder of success. But let's imagine together that we have a ladder and on each step of the ladder is a percentage of achievement.

100 per cent—I did
90 per cent—I will
80 per cent—I can

70 per cent—I think I can
60 per cent—I might
50 per cent—I think I might
40 per cent—I could
30 per cent—I wish I could
20 per cent—I don't know how
10 per cent—I can't

A banker friend of mine, H. L. Dunham of Phoenix, Arizona, says it takes 80% plus people to operate successfully an organization of size and importance.

I'd like to suggest that each one of us draw a line on the above, indicating how many steps we think we have taken on the ladder. Let's not fool ourselves. The important thing is to know where we stand today, and what we are going to do about it tomorrow.

This ladder of success doesn't necessarily mean material success. It could mean the ladder of successful health-building. It could be the ladder of successful education. Or a savings plan for our children. Or a program for improving our land, or building our herds of cattle.

It could mean a successful program for getting along better within our family circle; and with our neighbors. Or helping our country get along with its neighbors. It could mean success in overcoming prejudices in little things and in big things, and never teaching them to young people.

The real ladder of success is measuring up to our own capacity, whatever that capacity may be. My old camping friend, John L. Alexander, always said that if you are a pint measure, be a full pint measure with a little running over. But if you are a quart measure or a big gallon measure, then reach that capacity of your God-given talents and responsibilities.

My abiding interest is that we boost ourselves up another 10—20—30 per cent; especially boosting ourselves up past that 80 per cent mark. That's where things begin to happen!

Daringly,

WM. H. DANFORTH
Chairman of the Board

**Does the
RECORD**

For months, conceptions on first services in members' herds have been the highest in history. Last available 60-90 day non-returns showed 76% -- on the average, more than 7 of ten cows are conceiving on first breeding.

NYABC Members, who own and control their dairy cattle breeding organizations cooperating with their inseminators, local directors, headquarters employees, extension men plus their support of research efforts, have helped make this record.

The superior offspring from these conceptions are a matter of record. For details -- in Western Vermont and New York State, call your local unit that is affiliated with NYABC, or write directly to:

Western New York Farmers Work for Better Markets

By **L. B. SKEFFINGTON**

A NEW organization to represent the special interests of Western New York apple growers is to be set up. Following tabulation of questionnaires distributed at the annual meeting of the State Horticultural Society, the Western New York Apple Industry Committee started the ball rolling.

The questionnaires reportedly reflected the views of about 20 per cent of the industry. The committee interpreted them as indicating that growers wanted one organization to handle the problems of fresh and processed fruit. These problems include promoting use of apples, fresh and processed; obtaining better marketing and price information at harvest time; presenting growers' views to government agencies. There was some sentiment for bargaining on price.

Carl Wooster, Union Hill, is chairman of the industry committee, Mark Buckman, Sodus, vice-chairman, C. K. Bullock, Ithaca, acting secretary.

Committees are to draft plans for an organization with county units, to study possibilities of a state apple advertising tax and to explore possibilities of a cooperative processing plant. The Production and Marketing Administration is to be asked to encourage removal of uneconomic trees.

New Market Authority?

After years of discussion, a bill has been introduced in the Legislature to establish the Western New York Regional Marketing Authority. Monroe County would have 3 representatives on the board, Livingston, 2, and Genesee, Wyoming, Ontario, Orleans, Seneca and Wayne, one each. It is intimated that Steuben might be included later.

The proposed market would be located south of Rochester. The area now is served by the Rochester Public Market, operated by the city. The latter is reported planning to spend \$400,000 in the next few years on capital outlays. Objections to the Rochester market are that it is crowded, difficult of access, and does not provide room for expansion of facilities. Various proposals to expand or relocate the market have evoked divided sentiment. The current bill setting up the authority reflects the ideas of the growers' committee.

Would Curb Onion Trading

The Genesee-Orleans Vegetable Growers' Cooperative Association does not believe that trading in northern-grown onions on the Chicago Mercantile Exchange is healthy for growers. It has adopted resolutions saying that recent speculative moves are "an evil and a menace to the industry."

Canner Contracts!

In view of controversies over canner-grower contracts, remarks of M. P. Verhulst, secretary of the Wisconsin Canners' Association, at the annual canner-growers meeting at the Geneva station were listened to attentively. He said principal criticism of contracts in his state for sweet corn and peas was their "lack of mutuality. The contract sets forth the canner's rights and the grower's duties, but does not properly set forth the grower's rights and the canner's duties."

Need for Promotion

The farmer who doubts that advertising and promotion of his products can be effective has another guess coming. Some 200 nutrition workers assembled at Rochester to hear Dr. Betty Lockwood of the Harvard School of Public Health and Nutrition. She told of a three-year survey of families with school children at Newton, Mass.

One of her points was that children of lower income families often have better diets than families with more money, presumably because the latter have the temptation to eat fancier foods. She said studies indicated only a third of the children were receiving adequate amounts of leafy green and yellow vegetables; only slightly more than half were receiving citrus fruits; and a third lacked amounts of milk and eggs essential to good diets.

She said results of the survey to date indicated there was plenty of opportunity for nutritional education to influence families to include more of the essential foods in their purchases.

Milk Agency Decade Old

The Rochester Cooperative Milk Producers' Bargaining Agency marked its 10th anniversary at a dinner with Wendell P. Davis, president of the New England Milk Producers' Cooperative Association, as the principal speaker. Oscar G. Smith, Livonia, agency president, was chairman of the event. Toastmaster was Don J. Wickham, Hector, vice-president of the State Farm Bureau Federation.

Heads Cherry Week

H. Blaine Pearson of Alton, chairman of National Cherry Week, presided over the national cherry pie-baking contest in Chicago. Twenty-one states were entered in the contest. Pearson also headed the state contest committee, which produced 15-year-old Dorothy Busby of Canandaigua as state champion.

STEBEN POTATO CONVENTION ATTRACTS RECORD ATTENDANCE

FAVORED by fair weather and an unusually good program, the Steuben County, N. Y., Potato Growers Convention established an all-time record of attendance at its 23rd annual session held at Cohocton, February 9 and 10.

The two-day program presented by thirteen different speakers from four states, began with an illustrated talk on potato growing in Colombia, native habitat of the crop, and was concluded by the address of Dr. Allen Stockdale of the National Association of Manufacturers.

"The manufacturing industry is keenly interested in the problems of farmers and realizes these problems must be solved if America is to enjoy a prosperous, stable economy," Dr. Stockdale said. "It is clear that no group can prosper for long apart from all other groups. The farmers must be prosperous in order to provide a market for industry and business, and the latter groups must be reasonably stable to buy the produce of farmers."

Dr. Stockdale emphasized that any solution of the farm problem should enable farmers to function as "free individuals in a free society" and not subject them to controls which "deprive them of the fruits of initiative."

Food Policy Unsound

Herbert Voorhees, president of the New Jersey Farm Bureau and director of the American Farm Bureau Federation, recommended that "we quit copying failure" in our national food policy.

"The methods now proposed to solve farm problems of the United States have been tried in other places and earlier times in the world's history and found to be ineffective," he said. "Farm programs should be more concerned with the problems of the industry than political expediency."

SAVE That Silo!

Save money, too! If your present wood stave silo is out of shape, weakened, or even collapsed . . .

REBUILD THE CRANELOX WAY

1. Good material in your present silo — for Economy.
2. Silafelt — for Insulation.

PCAs Grow Up— 90% Farmer-Owned

AT ONE TIME production credit associations in Farm Credit District No. 1, comprising the northeastern states of New York, New England and New Jersey, operated on 5½ million dollars of borrowed government capital. Today there is less than 1 million dollars—\$900,000 to be exact. The rest of the government capital has been paid back.

In other words, farmers of the Northeast have invested 4¾ million dollars in the stock of production credit associations, and collectively they have 3¾ million dollars of accumulated earnings, or a total of 8 million dollars of farmer-owned net worth, while the government has less than 1 million dollars invested in the associations.

The farmers have nearly a 90% equity in the business, and the government has only about a 10% mortgage. That is progress!

During the past year there were five associations—namely, Riverhead, New York; Hartford, Connecticut; White River Junction, Vermont; Providence, Rhode Island; and Worcester, Massachusetts—that were completely free of government capital. On December 31, four others—St. Johnsbury, Vermont; Taunton, Massachusetts; North Jersey at Morristown; and Canandaigua, New York—completed repayment of all government capital. This makes 9 of 35 associations in the district that are completely owned by farmer members.

Six other associations have reduced government investment to \$5,000, which probably means that these, and possibly a few others, will make their final payment at the close of 1950. It is certain that at the end of 1951 a large majority of the associations all over the District will be completely farmer-owned, and it is probable that two years from now every dollar of government capital in production credit associations will have been repaid.

One of the chief reasons for the fine results that have been achieved by the production credit associations, not only in paying off government capital but in the services that they have rendered to farmers, is their leadership. When the systems were organized, farmers were particularly fortunate in their choice of local officers and directors elected then and since—the most capable men in the communities.

This same type of competent, effective leadership has prevailed with the officers of the Production Credit Corporation and the Farm Credit Board at Springfield, and with the central office at Washington. Both Washington and Springfield have been cooperative and helpful in working with the local associations without interfering with the excellent local direction and management.

"After All, I've Reached The Age When It's Time for Me to Retire and Get Off the Farm, Anyway—"

Heavy-Duty Highway

Right here in America we have the world's greatest system of heavy-duty highways—steel highways that don't cost the taxpayer a dime.

These highways—the 383,000 miles of railroad track in the United States—are always at your service, in any season of the year, to carry you or your freight to any part of the continent.

To improve these highways—and to add new and better cars and locomotives to serve you still better—the railroads have spent, since the close of the war, more than 3½ billion dollars.

And the more the ample capacity of these special steel highways is used to carry the commerce of the nation, the less the wear and damage on the public highways, the lower the cost of their repair and rebuilding—and the greater the safety and convenience with which you and your car can use them.

You See More, Cultivate Faster, Cleaner

There are a lot of features that make a Massey-Harris Tractor and Cultivator easy to handle... features that make for more and better work, in less time, with less effort.

Not the least of them is the complete, clean view you have of the work, due to the location of structural members outside your line of vision... the tapered design of the tractor hood... the high position of the tractor seat.

Moreover, the cultivator is properly located for fast dodging in crooked rows. It is easy to adjust for close, accurate work. The "Trigger Latch" — a Massey-Harris development — makes it easy to attach or detach the gangs without disturbing adjustments.

Rigid construction assures close, clean work. Well balanced gangs come up quickly... lower again just as quickly... are held to their depth with the Massey-Harris "Depth-O-Matic" hydraulic system.

Massey Harris Cultivators for Massey-Harris Tractors are built in two, four, and six row sizes with a wide variety of sweeps and shovels for every type of crop or method of cultivation.

Talk to your Massey-Harris dealer about a Massey-Harris Tractor and Cultivator for your farm. Ask him for a copy of the latest tractor catalog which shows the entire line of Massey-Harris mounted and semi-mounted tools. Or, use the coupon below.

TEAT DILATORS

Paper Towels for Cleaning Cows' Udders and Teats

By DR. H. G. HODGES,

Supervising Veterinarian, New York State Mastitis Program, New York State Veterinary College

FOR 15 years or more some dairy-men have been trying to use ordinary paper hand towels for washing cows' udders and teats. They haven't been satisfactory. They are too thin and when immersed in water or an antiseptic solution they do not hold together.

Now, after two years of experiments and trials with paper towels designed especially for use on cows, an Eastern manufacturer has produced a satisfactory one that has been placed on the market.

Cooperating with the manufacturer were a large number of dairy farmers and veterinarians in New York who put the various experimental towels to work under actual dairy barn practices. Many of these tests were conducted under the observation of veterinarians associated with the New York Mastitis Control Program. Observations and suggestions of all these people were used in designing the towel.

Long-Time Problem

One of the biggest problems in producing high quality milk is keeping dirt out of the milk. The very location of the cow's udder on her body causes the udder and teats to become soiled with dirt from the stable cow bed and mud and dust in cow yards, lanes and pastures. If the manure and other filth are not removed before milking, they may get into the milk.

Sediment in milk is highly undesirable in itself but is often made even worse by the presence of objectionable odors and high bacteria counts made by the dirt. Many authorities consider that infection is transmitted to the udder through the teats during the act of milking, by infected hands, teat cups and udder cloths. When infection is present, streptococci and other kinds of mastitis bacteria can be detected in the cloth and water and even on the outside of teats which were negative before being washed.

The best way to prevent sediment in milk is to remove dirt from the udder, teats and flank by thorough cleaning before milking. This is easier said than done because it requires a clean, sterile towel for each cow.

On the average farm, washing and sterilizing a towel is not easy. A satisfactory job requires a washing machine and adequate amounts of hot water and cleaning powders. Then, after washing, it is imperative that the cloth towels be sterilized and properly stored until the next milking. Here hot water sterilization would seem advisable, but is rarely, if ever, practical.

A frequently used method of attempting sterilization after washing is to soak cloths in some antiseptic solution such as chlorine or a quaternary ammonium solution. These preparations are not effective in killing bacteria unless they come in contact with

materials or surfaces free of organic matter. And it is doubtful that under ordinary washing procedures, udder cleaning cloths are free of organic matter. Towels that are dried after cleaning and sanitizing probably will be in the most satisfactory condition for use at the next milking, but this also isn't practical on most farms.

Altogether, this creates a difficult situation. Cows' udders and teats get dirty and must be cleaned or dirt gets into the milk, bringing low quality and frequent rejection at the milk plant. The use of one cloth on several cows is not satisfactory because the towel and the antiseptic solution soon become filthy and contaminated with many kinds of bacteria, some of which are mastitis producing. If individual towels are used, their care is costly from the point of labor, equipment and time consumption, and even then the towels are often not fit to use. It was this difficult problem that prompted dairy-men to try paper hand towels and then spur manufacturers to produce a satisfactory disposable towel for dairy barn use.

Paper Does the Job

The paper towels tested have the size and quality needed; are thick enough to pick up a fair amount of cleaning solution, and strong enough to withstand rubbing and massaging of the udder without tearing. After cleaning and massaging the udder, it is very important to remove as much moisture as possible. This makes it necessary to wring out the towels, and this can be done with the new paper towel without it tearing or breaking apart.

Many dairymen use a hot towel as an aid in stimulating the letdown of milk. A few who have tried paper towels report that they do not retain heat as long as cloths. This may be true but it is doubtful that the majority of dairymen use towels that apply a very high degree of heat anyway. However, if water heated to 130 degrees is used and kept at that temperature, little difficulty should be experienced in applying the desired heat to the udder with paper towels. Fast milking is probably accomplished more as a result of a good milking system that creates good milking habits of the cow than it is through the use of hot towels.

Use of a clean, single-service udder-cleaning paper towel free of mastitis bacteria is not the complete answer to control of bovine mastitis and production of clean milk, but it will help.

(Note: The towels tested were furnished by the Brown Co., Berlin, N. H., under the trade name, Nibroc Kowtowl.)

Two members of the New York State Mastitis Control Program, Dr. H. G. Hodges, supervising veterinarian, left, and Dr. M. G. Fincher, director, right, watch student dairyman Henry D. Bither wash udder and teats with the new single-service disposable paper towel.

KLEEN-EZEY is BEST ALL-WAYS!

- ★ simplifies cleaning.
- ★ quick bacteria kill—99.99999+ % within one minute in water of any hardness.
- ★ deodorizes — by absorption — no "hiding" of odors.
- ★ no chlorine or lye rinses necessary.
- ★ absolutely safe to use in recommended solution — no injury to the skin, metal, rubber or plastic.

Hormones for Tomatoes

Tomato growers are showing interest in the use of hormone sprays to increase the set of early fruit. Experiments show definitely that hormone-sprayed plants produced earlier and larger fruits at first picking, and this first picking, of course, is the one from which highest returns are secured. It is possible, however, that the total yield of tomatoes may be decreased.

Many fruits that set as a result of spraying with hormones lack seeds, but this is no particular disadvantage. The color and flavor are normal, but there are indications that some tomatoes from hormone-treated plants may soften more rapidly than normally after being picked. It also seems in some cases that there is an increase in blossom-end rot.

Any one of several commercial products is used according to manufacturer's directions. The cost of treatment for one acre is around \$5 or less. The first spray is applied when 2 or 3 flowers are open on the first cluster, and a second spray may be applied 6 or 7 days later when additional flowers are open, if you think that these flowers may be exposed to cool weather. It takes from 3 to 5 gallons of the spray material per acre and an attempt is always made to confine the spray to the flowers; the sprayer nozzle is held fairly close to the cluster of flowers. With proper hand equipment a man can spray 2 or 3 acres a day.

—A.A.—

FERTILIZING PASTURES AND HAYFIELDS

(Continued from Page 8)

that not enough potash is being used. Most Northeastern agricultural colleges now offer a soil testing service which is very helpful in evaluating the need for potash on a particular soil. When it comes to phosphorus, it is a safe bet that it is generally needed and that the amounts needed on a particular soil are not so apt to vary from the general recommendations as in the case of lime and potash.

Nitrogen for Grass

When we come to the crops, so far as hay and pasture goes, it is largely a matter of proportion of legume to grass. If legumes predominate, potash becomes considerably more important than if grass predominates. On the other hand, if grass predominates, nitrogen becomes much more important than where legumes predominate. Much of the grassland in the Northeast contains relatively few legumes and the use of nitrogen on the grass will greatly increase yields. There is no object, however, in increasing yields unless the grass is going to be fed; but there are comparatively few dairy farms on which more grass could not be fed as hay, silage or pasture to the benefit of the cows and the dairymen's pocket-book.

A basic and sound dairy farm practice is the reinforcing of manure with superphosphate. The best way to use superphosphate is in the gutter of the dairy barn and on the floor in back of the cows. One and one-half pounds per cow per day is about right. Superphosphated manure is an excellent fertilizer for top dressing grasslands from now until spring, except those that will be grazed early. It is also an excellent basic fertilizer for corn.

In the table on page 8 we have attempted to compile and condense the fertilizer recommendations for hay and pasture lands of some typical Northeastern states. In such a table it is not possible to include every variation for every possible condition. The differences between states are due to differences in the predominate kinds of soils, economic conditions and to some extent, differences of opinion.

10 Facts to remember about **NATURAL**

CHILEAN NITRATE

1. **Natural.** Chilean Nitrate is the only natural nitrate in the world.
2. **Nitrate Nitrogen.** The nitrogen is 100 per cent nitrate.
3. **Sodium.** Chilean Nitrate contains sodium equivalent to about 35% sodium oxide (Na₂O). This acts like potash (K₂O) and helps to make the phosphate in the soil more available.
4. **Iodine.** Chilean Nitrate contains iodine to help meet the needs of plants, animals, and human beings.
5. **Other Plant Food Elements.** Chilean Nitrate contains small quantities of other elements that contribute to strong, healthy plant growth, such as manganese, potassium, magnesium, boron, calcium, iron, sulphur, copper and zinc.
6. **Ideal Condition.** Chilean Nitrate

comes in free-flowing pellets — easy to handle and to apply in any distributor.

7. **Quick Acting.** Chilean Nitrate is immediately and completely available.

8. **Anti-Acid.** Chilean Nitrate helps keep the soil sweet.

9. **Time-Tested.** Chilean Nitrate has been proved by more than 100 years of research and practical farm experience.

10. **Doubly Profitable — Economical.** Chilean Nitrate improves the quality of crops as well as the yield. Consistently excellent effects of heavy applications year after year upon crop and soil alike make it an outstandingly profitable, economical nitrate.

Poor Seed is Too Expensive!

ALTHOUGH we agree wholeheartedly that the present economic situation calls for economy on the farm, there is one way where attempts to cut costs may result in "saving at the spigot and wasting at the bung hole". That way is to try to save money on seed.

Much has been said about good seed. It is a term which covers a lot of territory and when we consider the many kinds and varieties of seed that the farmer buys, perhaps there is no definition that will cover everything. However, let's see if we can't at least agree on some requirements of good seed:

1. VARIETY. Unquestionably some varieties are better than others, and plant breeders are always developing new varieties, many of which are better than the old. At any rate, it is up to the buyer to give some thought to varieties and to choose those which carry the characteristics he wants. He may choose one variety of sweet corn for the home garden and another for market. He may want one variety of field corn for ears and another for silage; or if he uses one variety for both, he will certainly want a variety that is likely to mature in his area.

2. HARDINESS. This characteristic is particularly important in legumes for hay and pasture. If you are buying alfalfa seed, you are wasting your money if you get seed grown in an area where the winters are so mild that the alfalfa will not stand the winters where you live.

3. DISEASE RESISTANCE. This characteristic will not apply to all crops or all varieties, but there is an increasing number of varieties which have immunity to some diseases or which are resistant to them. Where seed carries this disease resistant characteristic, and where the other characteristics of the variety are favorable, this is one of the best ways in which to control disease.

4. FREEDOM FROM WEEDS. Many of the smaller seeds such as grass seeds which are offered to the public at bargain prices are "lousy" with weed seed. The buyer loses in two ways. If the seed he buys has 5 per cent of weed seeds, he gets 5 per cent less of the seed he wants, and in addition he gets a dose of weeds, one or more of which may be new ones on his farm.

5. VIABILITY. This is a ten-dollar word meaning the ability to grow. It is important not only that seeds sprout but that they have vigorous sprouts which will develop into healthy, vigorous plants.

There are certain State and Federal laws which protect the seed buyer. But they protect you only if you read the tags and use the information thereon. In general, you will find the percentage of germination and date of test, but there is no law which prevents sale of seed with poor germination. Likewise, you will find the percentage of weed seed on the tag. Although the percentage may be high, the seed still can be sold if properly labeled. It is up to you to read the tag and to be governed by what it says.

Many seeds carry a tag which reads: "Certified." By and large, seed carrying such a tag is much better than the "run of the mill" stuff. "Certified" seed is likely to be of varieties that are adapted to your area, of strains that have been bred for high yield, and disease free so far as certain specified diseases are concerned. Such seed will cost a little more than that not certified, but most farmers believe it is worth the difference.

Although it is mighty poor business to save money by buying cheap seed, there is one way in which economy can

be practiced—namely, in deciding on the rate of seeding. This method of saving applies particularly to the smaller seeds such as grass and clover. If a seed bed is fitted perfectly and if growing conditions are favorable, you can get an excellent seeding at half the rates usually recommended. At any rate, it is very certain that you will waste your money if you put grass or clover seed on land that has a very poorly fitted seed bed.

You can also waste plenty of grass and clover seed by getting it covered too deep. More and more farmers are dropping the grass seed behind the grain drill rather than in front of it. This results in having a far greater proportion of seed at the right depth than it does when seed is dropped in front of the drill.

Another safeguard is to treat your seed or to buy treated seed. For example, corn that has been treated is much less likely to rot and require replanting if we have a cold, wet spring. Potatoes that have been treated will usually give a much better stand. Many kinds of seed are now treated before they are sold to farmers. Others can be treated on the farm at small cost in money and labor.

Sometimes a farmer wonders if he can cut costs by growing seed on his own farm. In some cases it may be practicable, but, more and more, seed growing is becoming a specialized business in which a farmer cannot afford to engage. Almost always the answer is to buy seed, and to buy the best.

— A. A. —

CUCUMBERS FOR PICKLES

A. E. Wilkinson, vegetable specialist of the University of Connecticut, writing on fertilizer requirements of cucumbers for pickles says that the fertilizer requirements of this crop differ somewhat from cucumbers grown for slicing, due to the fact that cucumbers grown for pickles are produced in a short season. Also, they require much available plant food. The amount of fertilizer to apply varies with the condition of the farm soil.

In the Brooklyn area, where poultry manure is available, 5 tons per acre plus 500 pounds of 0-14-14 or its equivalent are suggested. Where stable manure is used, 15 to 20 tons per acre plus 1,000 pounds of 5-10-5 fertilizer can be used. In addition, one or more sidedressings of nitrogen may be needed.

The first application should be made when the cucumber plants start growth and are 6 to 9 inches tall. The second application should be made about the time the plants begin to run. The amount of nitrogen to apply at each sidedressing should be the equivalent of about 300 pounds of nitrate of soda.

"Why SHOULD she wait until the right man comes along? I didn't!"

Know how to get better crops, bigger yields, MORE PROFITS?

Here is a FREE booklet that tells you how. It's an up-to-the-minute collection of the latest information on clovers, oats, alfalfa, corn, pastures, etc. Tells all about "Buffalo" Alfalfa, "Cumberland" Clover, "Clinton 11" Oats, Birdsfoot Trefoil and other new seeds that are growing in popularity.

It also gives you profitable, practical tips on applying fertilizers, cutting silage, controlling insect pests and many other tested methods that mean better crops, bigger yields — more money in your pocket.

Cross Pollination

MORE OFTEN than is commonly realized, the lack of cross-pollination is the cause of poor fruit crops, especially in home gardens. Years ago most orchards contained several varieties. Then as fruit production moved from home consumption to commercial, and as some varieties proved more profitable, solid blocks of a single variety were set out.

While some varieties of apples and other fruits are self fertile, many are not and others give better results if cross-pollinated. Now, most nursery catalogues give this necessary information on this subject.

The necessity for cross-pollination is understood by most commercial fruit growers. It is just as important for the backyard gardener. Do not set fruit trees before investigating the need for cross-pollination and be sure that the varieties you set are suitable for cross-pollination.

— A.A. —

LAWNS NEED PLANT FOOD

When building a new lawn, keep in mind that the lawn is meant to last for many years. Soil preparation, therefore, should be as thorough as possible. Good physical condition, drainage, aeration, and proper grading are often as important as fertility.

On the fertilization of a lawn, Richard Hopp, Vermont Horticulturist, says, "It is difficult to make over-all recommendations as to the amounts of lime and fertilizer needed when preparing the seedbed. Considering that most of our soils need lime, an application of 75 lbs. of ground limestone per 1,000 sq. ft. should meet most needs, together with 25 to 50 lbs. of a complete fertilizer, such as a 5-8-7, depending upon how much manure has been used in preparing the soil."

— A.A. —

NITROGEN ON MUCK

There is some evidence that vegetable growers on muck soil need to pay more attention to nitrogen in their fertilizers. During a wet, cold spring it appears that nitrogen is often leached from the soil to the extent that early crops lack nitrogen and may respond to a side dressing.

During hot summer days, nitrogen is made available fairly rapidly in well-drained muck that is not too acid, but even so, rapid growing crops like lettuce or spinach may need nitrogen, and crops like celery that use large quantities may respond to additional applications.

— A.A. —

SIDE DRESSING WITH NITROGEN

Side dressing vegetables with readily available nitrogen is standard practice of many growers. Usually it is not wise to use more than 200 pounds of a nitrogen carrier to the acre at any one time. For long season crops and where the soil is sandy, you are likely to get good results from two or even more applications during the summer. If the fertilizer is put on with a cultivator distributor, you can use sulfate of ammonia, nitrate of soda, or ammonium nitrate.

— A.A. —

BLOCKING OUT PLANTS

A week or ten days before you transplant cabbages or other plants from flats to garden, cut the soil between the plants with a knife. This will cut some of the roots but will tend to thicken the roots within the block and there will be less setback to the plant when set in the garden.

Also, water the flats thoroughly before transplanting. The block of soil will hold together better and less root damage will result.

YOU Get the Work Done Better with FRICK Power Farm Machinery

Whether you need equipment for plowing, harrowing, seeding, cultivating, harvesting, threshing, mowing, chopping, silo filling, baling, manure spreading, hammer-milling, dehydrating, sawing, planing, hauling, lifting, or belt work, there's a Frick machine of the size and type to meet your requirements exactly. THE LEAGUE***Never Quits Trying*****AND THE \$3,000,000 FLOOR****Under Milk Prices from March Through July
PROVES THAT IT PAYS OFF!**

Milk prices falling faster than production costs have worried dairy farmers in the milkshed during the last several months. Many feared that the new fluid milk formula which the Department of Agriculture was preparing for referendum vote would only add to their troubles . . . at least until August. But while thousands of farmers argued, protested and became more discouraged, the League determinedly tried again and again for favorable action.

We Got the Brush - Off Many Times

All during the fall, our attempts to get a hearing to consider raising fluid prices met with failure. Reports and rumors filtering back from Washington hinted that so long as the milk supply was adequate, the Agriculture Department would take no action. But we, as the oldest and largest producer cooperative, refused to cry "quits" until we'd turned every stone.

**Our President Went to Washington
And Came Back With a \$3,000,000 Increase**

When it seemed that all had been lost, our League president, Leon Chapin, and Secretary Hakes of the Metropolitan Bargaining Agency, went to Washington. They took all the facts and figures that two big producers' cooperatives could marshal. And they got in to see the top men. Men who proved to be of "open and fair mind" once the dangers of too-low producer returns were properly explained.

The result is a price floor of \$4.80 for March, \$4.58 for April, \$4.36 for May, \$4.14 for June and \$4.58 for July—a total increase of about \$3,225,000.00 for dairy-men supplying the New York City market, over what they would have received under the formula proposed in the New York milkshed price committee.

No, We Didn't Get All We Wanted

The League doesn't pretend that it is entirely satisfied with the outcome. But as a producer cooperative, we members of the Dairymen's League are always ready to support every effort that promises a fairer price for milk.

It's true that we always insist on two things: One, that the cost of production should be importantly considered in any formula which hopes to provide economic solvency and justice for the producer. Two, that no price or other remedy be adopted which threatens producers with loss of a year-round market for all of their milk.

But in the long run, the League doesn't fight just for its own ideas. We accept the basic truth that a prosperous dairy industry throughout the entire milkshed is the only foundation on which we can build our own prosperity. And we constantly work with all constructive agencies and movements to insure stable markets and fair prices for every dairy farmer in the milkshed.

DAIRYMEN'S LEAGUE***Cooperative*****ASSOCIATION, INC.*****It's Handy*****CUTTING STOVEPIPE**

"When I wish to cut a downspout, stovepipe, tin can, or other thin metal cylinder, I slip it over a post or pole held in a vise and mark around it with a string or rubber band dipped in flour, lime, or other white material and snapped at two or three places. Then I cut it with an old chisel, sharp cold chisel, or even an old butcher knife, struck on the back of the blade with a hammer.—I. W. Dickerson

If a rear view mirror is welded to the fender of your tractor, you can watch the implement behind you without constantly turning your head.—Ray Harrison, Dajoe, Sask.

**POWER DRIVEN GRINDSTONE
FROM DISCARDED PARTS**

This useful and efficient slow-speed sandstone grinder was made mostly from salvaged parts by mounting a discarded 16 inch grindstone upon a cream separator standard. A discarded 1/6 H. P. motor was mounted upon adjustable rails as illustrated.

Operation Empire!

By Raymond V. Hemming

IF THE affable and able editor of the "American Agriculturist" invited you to write a two-column piece on your outfit's doings, would you stick to the facts, or would you try to kid the public? If you respected Ed Eastman as I do, and I'm sure you do, you'd do your level best to tell the truth.

Empire Livestock Marketing Cooperative, a farmers' organization, owned by farmers through their cooperatives, operates six livestock auction markets in New York State. Organized in 1946, its first market was opened at Argyle on New Year's Day, 1947. On March 29th of that year the second market was opened at Bath. In quick succession, Gouverneur, on July 1st, and Greene, on August 24, 1947, became markets three and four.

At the end of 1947, a total of \$3,496,019.40 of livestock had passed through the auction rings of these four markets. All of this livestock had been consigned by farmers and dealers and bought by reputable buyers at current market prices. All but 4.17% of this total had been paid promptly to the consignors. The 4.17% was Empire's commission for service rendered, and was sufficient to permit Empire to meet all operating costs in its first year of operations, including a 4% dividend to its sponsors on capital stock which they had bought to furnish Empire with the necessary capital to open and operate these four markets.

These sponsors are New York State Grange, New York State Farm Bureau Federation, Producers Cooperative Commission Association, Dairy-men's League, and G.L.F. In addition to this payment for use of capital, Empire paid a Federal income tax, and had a small amount left over for the directors to allocate to a Bad Debt Reserve to protect the business. In other words, in its first year, Empire wound up in the black.

During 1948, another market was added, and commissions were reduced to a sliding scale at all markets. Oneonta became market number five on September 23rd. At the end of 1948, dollar volume was \$6,856,869.88. Empire's share was 3.71%. Like 1947, all expenses were met, interest on capital

was paid, also Federal income taxes, and a small addition to surplus was ordered by the directors.

Late in 1948, construction was begun on a modern livestock market at Caledonia. This was Empire's first attempt at building a market "from scratch". When this, the sixth of Empire's markets, was formally opened at Caledonia on March 29, 1949, a milestone was reached: \$80,000 was paid by buyers for livestock that went through the ring that day—all of it consigned. It was not a "flash in the pan"—as attested by the fact that \$1,895,174.58 was handled during the nine months it functioned in 1949.

Empire's six markets closed the 1949 books on December 31 showing \$8,676,495.92 of volume handled. Empire's commission was 3.80% of this amount. All obligations have been met, including Federal income taxes and various statutory reserves, plus another small addition to surplus. This \$8,676,495.92 came from the sale of 26,087 cows, 3,666 bulls, 13,036 dairy replacements, 69,067 calves, 11,483 hogs, 3,931 pigs, 5,097 sheep, 17,518 lambs, 1,055 horses, 13,500 miscellaneous livestock, 7,972 other articles, for a total of 172,412 units.

Empire, as previously mentioned, does not buy livestock. It acts as agent for the owners of livestock. Empire believes that its main function is that of a balance wheel between those that produce livestock and those that process it. Each is entitled to a square deal, and gets it at an Empire market. Empire's job is to attract enough good buyers to pay fair prices for livestock, and to see that such buyers get honest weights and fair treatment, the same as consignors. Empire firmly believes that the livestock industry benefits from an atmosphere of mutual understanding of each other's problems. We in management are extremely proud of the fact that many buyers tell us that they like to do business the Empire way.

Empire has some broad policies which were promulgated under the wise guidance of our president, Eugene P. Forrestal, and other directors, Palmer C. Flannery, Harold M. Stanley,

A LEADING DAIRYMAN of Washington County, N. Y., is Joe Wilbur, shown above with his son, Joseph, Jr. With another son, Sprague, they have built up a herd of over 100 registered Holsteins, including up to 51 milkers, on 552 acres near Bald Mountain. Wilbur sold his last grade cow two years ago. The present herd was started 14 years ago with some foundation stock and a series of high-performance bulls have been used since then.

GREEN HARVEST

gives you year 'round "pasture"

1

2

3

When the bloom is just right, when leaves are tender and protein is at its peak . . . you are set to go with your own Forage Harvester.

Make the best silage you ever fed, whatever the weather. Have the advantage of green feed the year 'round. Power handles the crop all the way. Heavy pitchfork labor is eliminated from start to finish. Even the spiral knives of the Forage Harvester's wide, easy-rolling cylinder are power-sharpened by a built-in sharpener.

The Allis-Chalmers power take-off Forage Harvester is actually three machines in one, priced for home ownership on the family farm. With three inexpensive attachments, it power harvests all forage crops, tall or short, green or dry:

1. Direct-cut attachment for grass silage, stubble, stalks.
2. Row-Crop attachment for corn, sorghums, tall crops.
3. Windrow pickup attachment for wilted or dry hay and straw.

The Forage Blower's long 11½-ft. conveyor lifts up for wagon to drive through. Special new curved fan blades throw chopped forage into highest silos or haymows. Matched to the big capacity of the Forage Harvester.

More livestock feed nutrients can now come from soil-building grass and legume hayland . . . at far lower cost. Your own Forage Harvester can be the most important harvesting machine on the farm. And back of it will be the skilled and conscientious service of your Allis-Chalmers dealer.

Why Hens Become Feather Pullers

By L. E. Weaver

WHY do my pullets pull out and eat each other's feathers? If a feather falls to the floor, a half-dozen pullets make a rush to get it. Do they lack something in their feed? How can I stop it before they are all bare?"

I have never seen a satisfactory answer to that question. I am quite sure that it is not a "lack of something in the feed." At least that is not all there is to it. One flock will be feather pullers while many other flocks on the same brand of mash will be free of the vice. On the other hand, however, some experimental stations have run careful tests and reported:

(1) That feather picking among

chicks was decidedly less where oats made up to a quarter of the ration; (2) That there was most picking on a high corn diet. Many poultrymen regularly feed whole oats to their laying flock because they are convinced that oat feeding helps to prevent feather pulling. Apparently it does help. It is doubtful if it is very effective if started after the habit has become well established in a flock.

Another established fact is that flocks of either chicks or laying pullets that get all the pellets they want are very likely to become feather pullers.

In thinking of these things, I have been wondering if they might not be

clues to the real trouble. For theory's sake, suppose we assume that it is a fact that the less time it takes a chick or pullet to eat all the feed it needs to satisfy its hunger, the more time she will have to just stand around and be idle, and the more bored she will become, and therefore the more likely she is to do something for a little excitement—pull feathers, for instance. If we assume that to be true we can also conclude that the more concentrated a given feed is, the more quickly the pullet will get her fill of nutrients.

Well, corn and wheat are much more concentrated feeds than oats. It takes about 130 pounds of oats to supply as much real nutriment as 100 pounds of corn. And pellets are concentrated mash, or grain and mash.

It ought to be easy to find out if this idea is just another theory or not. If making it easy for chickens to eat their fill in a hurry does lead to feather pulling, then there should be more barebacked flocks where:

- (a) Grain as well as mash is fed free choice.
- (b) Where grain is fed on packed-down litter rather than in deep, dry loose litter. It stays on top where it can be gobbled up in a hurry.
- (c) A couple of handfuls of chick-sized grain scattered in loose litter three or four times a day would give hens something to dig for and keep them too busy to get into mischief.

Perhaps someone will make a survey of feather-pulling flocks sometime. If so, I predict that he will find more than one management factor implicated. In the meantime, no one has to let his flock become barebacked because of the feather pullers in the lot. A good job of "debeaking" every pullet in the flock will stop the trouble at once.

I hope nothing I have said here will lead anyone to go to the other extreme, and make it so hard for his layers to get their feed that they don't get enough. That would mean a drop in egg production very soon. You might better let them pull feathers.

How To Order Chicks

Here is a hot tip just as it came to me on a postal card. "Hi Lee, how about putting a note in your column on how to order chicks? We get so many inquiries asking for prices and catalogue. If these folks would tell us what breed, sex, number and approximate date they want, we could answer inquiries more intelligently and save delays in correspondence, etc. Ordinarily, we write them what we have available."—Bob.

The Poultryman's Question Box

How can one get a hen to eat enough oyster shell and grit to prevent soft shelled eggs? I think this is one of the causes of hens eating eggs and keeping at it.

If your hens will not eat oyster shell and grit, it is probably because they do not need any more than they are already consuming. We know that there are quite a number of other reasons besides lack of oyster shell that may be the cause of weak shells in eggs. I think you are right that it is the fact that the eggs are easily broken that causes hens to eat them, and I think you are also right in assuming that if you can get the shells solid and harder, egg-eating may not be such a serious problem.

However, I would suggest that instead of wasting effort trying to get the hens to eat more oyster shell, you do something else in the way of pre-

(Continued on Page 20)

SUNNYBROOK

Once you try them — You'll always buy them!

IF YOU SHOULD ASK OWNERS OF SUNNYBROOK CHICKS WHY THEY BUY THEM YEAR IN AND YEAR OUT, THEY WOULD TELL YOU THEY HAVE LEARNED THE HARD WAY, THAT THERE ARE NO BABY CHICKS ON THE MARKET THAT CAN EQUAL SUNNYBROOK CHICKS, FOR THEY ARE, BEYOND ALL DOUBT, THE MOST OUTSTANDING BABY CHICKS EVER PRODUCED.

WON'T YOU TRY SUNNYBROOK CHICKS THIS YEAR? WE HAVE THEM IN ALL THE POPULAR BREEDS. OUR INCUBATORS, FILLED WITH NEARLY 400,000 EGGS ARE RUNNING TO FULL CAPACITY—SOME WEEKS ARE BOOKED SOLID. EASTERN MILK PRODUCERS OPPOSE NEW CLASS I FORMULA

DELEGATES of the Eastern Milk Producers Cooperative Association, meeting at Syracuse on February 21 voted AGAINST the new formula for pricing Class I-A milk as proposed by the U.S.D.A.

The new formula follows the recommendations of a committee headed by Dr. F. F. Hill of the N.Y.S. College of Agriculture and appointed by Administrator Blanford. The formula is based on three factors: (1) the general price level; (2) the supply and demand for fluid milk as indicated by the per cent of total milk used as fluid, and (3) a factor to encourage more uniform production throughout the year.

Before you read this, the voting on the formula, which is an amendment to the Order, will be completed. It will become effective if two-thirds of the milk producers in the New York Milk Shed approve it. If it is approved, floor prices for fluid milk will be set for March through July to ease the transition to the new Order. The Class I-A floor prices would be: March, \$4.80; April, \$4.58; May, \$4.36; June, \$4.14; July, \$4.58. Thereafter the new formula would determine the Class I-A price.

—A.A.—

OPERATION EMPIRE!

(Continued from page 17)

Clarence E. Johncox, Ernest O. Strobeck, George W. Slocum, Newell S. Hutchinson, J. Stanley Earl, Clayton G. White, and James A. McConnell, ably assisted by our operating committee of S. R. Farley, E. S. Foster, and C. L. Dickinson. A few of these policies are:

1. All slaughter stock is sold by weight on regularly tested scales.
2. Clean and sanitary facilities are maintained.
3. Prompt payment is made.
4. Everyone is charged the same rate of commission at same market.
5. Empire does not buy livestock, therefore does not speculate.
6. Rapid dissemination of market prices is provided.
7. A high standard for the industry is set.
8. An advisory committee of farmers is active at each market.

How can farmers use Empire? They can use Empire as a place to dispose of slaughter animals at fair prices, to buy dairy replacements, feeder pigs, or feeder lambs, or stocker and feeder cattle that are honestly represented. A farmer can call or write to an Empire market for advice on when to sell or buy, or for trucking, if needed. Empire doesn't own trucks, but works with local truckers to provide adequate transportation at fair rates.

Farmers have up-to-the-minute market information provided by Empire daily over Rural Radio Network, other radio stations, newspapers, and weeklies. Farmers can consult Empire Advisory Committee members in the area of the market, who are kept informed of Empire's policies and activities.

Above all, farmers who use Empire will be doing themselves, Empire, and others a real service if any mistakes or dissatisfaction are reported immediately to Empire's market managers. In any business, mistakes are bound to happen, and need to be rectified promptly.

Empire is a service agency—your service agency.

PROGRESS

Forty years ago when the first cow testing association was organized, cows under test produced an average of 215 pounds of butterfat per year. Today, one million cows in DHIA are producing an average of 330 pounds of fat per cow a year.

BASED ON EXPERIENCE DESIGNED FOR SERVICE

SIMPLE • STURDY • PRACTICAL

No T-Clamps to slip—all welded or directly bolted—23/8" support posts are high carbon steel, not just ordinary pipe—rigid, triangular-brace construction—centrally supported non-sagging gates... Built for Endurance!

MILK... Without ALL that STOOPING and SQUATTING! Your cows come to you within easy, arm-high reach of your milking machine. And you never have to step over a gutter with the Surge system of milking cows.

FEED... With FEWER Steps and LESS HAULING! Just because you're used to miles of walking and hauling when you feed your cows is no reason why you have to. With the Surge system the cows do the walking and hauling for you.

CLEAN... A lot Easier than the way you Do! You won't have a daily barn cleaning chore with the Surge system. You can quickly hose down the milking room easily. This means cleaner milkings... cleaner milk.

The Poultryman's Question Box

(Continued from Page 18)

vention. For one thing you might add some cod liver oil to your daily ration, because the lack of Vitamin D in the ration is much more apt to be a cause of poor shell quality than is the lack of sufficient calcium or lime.

Sometimes it is not the feed at all that is at fault when egg-eating takes place. Some hens get smart as they get older and learn how to break eggs. They climb in the nest and dig around until they knock the egg against the side and crack it. Perhaps if you stay in the poultry house for several hours at a time, you can locate the hens that are doing this, if it is happening. Then by simply taking the hens out, you will end the trouble.

Some people have been quite successful in putting an end to the trouble by darkening the nests, and others have told me that by clipping the end of the sharp beak so that it is blunted, there is less trouble. I certainly hope that among these various suggestions, you find one that works.—L. E. W.

The litter in my laying house is altogether too damp. I tried more ventilation but haven't been able to solve the problem.

There are a number of angles to this problem. The moisture comes mainly from the hen's bodies, and the more of it you can remove from the house by ventilation the better it will be. However, experience has shown that a house with built-up litter is much drier than one that has very little litter. For one thing, cold, bare floors cause the condensation of moisture from the air. There is a theory that the bacteria working in dry litter produce heat which helps to evaporate moisture.

Try built-up litter next year. In the meantime, there isn't much you can do except to change litter frequently, and of course try to manage your ventilation system to get the best possible results from it.

How large a house would I need to have for 12 hens?

A 6x8 house will give them sufficient floor space. It isn't even essential that you build such a house large enough to stand in. It is possible to make a small house so that hens can be cared for from the outside. There are some excellent suggestions about small poultry houses in "A Basic Chicken Guide" by Roy Jones of the Connecticut College, published by William Morrow & Co., 425—4th Avenue, New York 16, N. Y. The price is \$2.50.

Is it true that chicks will not have pullorum if they are bought from hatcheries that blood test breeders?

Let's put it this way. Your chances of getting chicks free from pullorum are much greater. In fact, if you buy from a hatchery that advertises "no reactors found," you are practically certain that the chicks will not have

"Please don't scare the chickens, Junior!"

Say you saw it in AMERICAN AGRICULTURIST

pullorum. Where breeders are merely blood tested and reactors removed, there is always the possibility that some reactors were missed and that some chicks will carry the disease.

* * *

Is it feasible to make a homemade brooder?

Yes, if you have electricity available. For a few chicks a 100 watt lamp will give sufficient heat, if you have a home-made, insulated hover for them to run under. For larger numbers you can use one or more electric heat lamps as a source of warmth.

— A. A. —

**PASTURES FOR
POULTRY PRODUCTION**

Good grass and legume ranges save on mash, supply available nutrients, keep the birds out of the mud and reduce disease hazards, according to Professors Dickey and Leuschner, agronomy and poultry specialists, respectively, of the Pennsylvania Extension Service.

They say that an acre of good range will carry 500 to 600 pullets up to 22 weeks of age and from 100 to 200 turkey poult on a like area. Ladino, a giant form of white clover, in their opinion is the basis and backbone of most productive and palatable poultry ranges.

Since some grasses are desirable in a range mixture, they recommend the following: Six pounds Kentucky bluegrass, 6 lbs. perennial ryegrass, 2 lbs. redtop, 2 lbs. Ladino clover, and 1 lb. of white clover per acre. On dry slopes they suggest addition of 4 lbs. of Canada bluegrass. On turkey ranges they advise substituting in this mixture six pounds each of alfalfa and orchard grass instead of the bluegrass and white clover to give greater productivity and wearing qualities.

In their opinion August is the best time for seeding. When the seed is sown, it should be covered with a cultipacker or very light harrowing. For fertilization they recommend a liberal application of 400 lbs. of a 3-12-6 or 4-12-4 before seeding.

— A. A. —

HEN HOTEL

IN a recent issue of Featherfax, a mimeographed publication of the University of Massachusetts, John Vondell comments as follows on a poultry house which he recently visited.

"The other day we motored up the river a few miles and visited a couple of new hen houses. One place had 3,000 layers in a pen and the other farm had 5,000 layers in one room. There were no roosts. Automatic waterers took care of the watering problem, and one huge automatic feeder ran continuously 14 hours a day. This feeder ran around the four sides of the house. The attendant had to open a few bags of feed now and then and dump them into the chute that led into the automatic feeder. The big chore was picking up the eggs and packing them.

"One man took care of the 5,000-6,000 birds and packed the eggs. The house allowed 2½ square feet of floor space per bird and cost about \$1 per square foot, all equipped."

Such houses make tough competition for poultrymen who continue to keep hens in houses which require a large amount of hand labor.

— A. A. —

WHITE GUINEAS

IN YOUR issue of January 21 on page 17 you state that Idle Wild Farm at Pomfret Center, Conn., is the only farm in the East raising African White Guinea hens.

I have been raising them successfully for the past five or six years. Also, my birds are sent dressed for the oven to practically every state in the union where I have customers—even to British Columbia.—Mrs. L. R. Kimball, Williamstown, Mass.

Question Box

I would like to know what kind of grass seed to use in seeding a pear orchard down with alfalfa. Also, what is the best kind of alfalfa to use?

Probably the best grass to seed with it is timothy, and 6 to 8 pounds to the acre of timothy plus 10 pounds of alfalfa is a good rate. But if the soil in this pear orchard is not good alfalfa land, cutting the alfalfa down to about 5 pounds and adding some red and alsike clover would be better than using alfalfa as the only legume. Standard alfalfa varieties for New York for years have been Grimm and Northern Variegated. Either one of these would be satisfactory.

However, on Wilt infested soil (and this includes a large part of the alfalfa

land in the State that has grown alfalfa for any period of years) the new variety, Ranger, is superior, since it is resistant to Wilt and will survive for a longer period than the other two mentioned.—G. H. Serviss.

My 4-months old pigs have developed a lameness which resembles rheumatism. Can you tell me what causes it?

There are a number of conditions that may cause pigs to become lame, but since you say you are feeding these pigs wheat middlings, I am inclined to believe your difficulty is due to a ration that is being fed. Your ration, no doubt, is low in calcium as well as inadequate in other respects. A ration for growing and fattening pigs that is deficient in calcium and phosphorus and also low in vitamin D content may cause a condition called "rickets." A discussion of this disease is found on pages 44 and 58 of Bulletin 727, which I am sending to you under separate cover. In this bulletin you also will find a number of suggested rations and helpful suggestions.—John P. Willman.

Last year many of my asparagus stalks grew very crooked before they were ready to harvest. What caused it?

Asparagus beetles feeding on the tender shoots caused them to grow unevenly. You can dust with rotenone during the growing season or with lead arsenate after the harvest is completed.

How long should it take to get a high-producing cow on full feed after calving?

Three or four weeks. The problem of bringing her back to full feed is one that requires individual attention. A cow has very little judgment about eating and will eat too much if you give it to her. No two cows are exactly alike and the expert feeder, by watching a cow, can avoid overfeeding.

During the war we were advised that it was unnecessary to feed ~~cows~~ a ration high in protein. Now most of my neighbors ~~are~~ again feeding a ration that contains plenty of protein. Were the experts kidding in wartime or are dairymen feeding too much protein now?

The answer to this is a matter of opinion, but we believe that the experts were right and that many dairymen are now feeding more protein than necessary.

FEEDING VALUE OF POTATOES

Feeding potatoes at 35 cents per hundred pounds today is the most economical buy in dairy feeds on the basis of total digestible nutrients. The cost of 100 pounds of nutrients is \$1.96. Next in line is molasses at \$30.00 per ton with a cost of \$2.78 for 100 pounds of total digestible nutrients.

These two feeds may help you in stretching your hay supply if it's short. You can feed 15 to 20 pounds of potatoes per cow per day. Molasses can be fed up to 3 or 4 pounds per cow per day. Timothy hay at \$30.00 per ton costs \$3.07 per 100 pounds of total digestible nutrients. — Lucien Paquette, Addison County Agent, Vermont.

AVOID PRODUCTION LOSS FROM SORE SCAB OBSTRUCTED TEATS HARD MILKERS

To resist infection and promote healing, use

TREAT THEM SAFELY

FLEX-O MEDICATED DILATORS

Pliable, absorbent internal dressings for the teat canal. Cloth-covered, without wires, they exert a gentle dilating action, and work FOUR ways:

1. Carry antiseptic and healing agents into teat canal.
2. Provide soothing relief to damaged tissues, absorb secretions from inflamed teat.
3. Aid in maintaining a free milk channel by keeping teat canal OPEN until healed.
4. Make milking easier by partially relaxing sphincter muscles at end of teat canal.

TWO SIZE DILATORS

Regular—for small or average teats. Large—longer and wider—for long or large teats. Economy Pkg. 48 Dilators.....1.00 (Either size) Standard Pkg. 24 Dilators......65 (Either size)

"Your folks need a good baby sitter, Baby?"

Painting Pointers

By LOUISE PRICE BELL

THE OLD SAYING that "paint covers a multitude of sins" is very apt. Odd pieces of furniture that have no relation to each other in appearance often become a most useful and attractive unit for some room, if painted an attractive color and perhaps trimmed with a contrasting one. Here are some suggestions in connection with that fascinating home task that many homemakers dabble in when trying to make things "do" instead of buying new pieces.

Avoid painting on a windy day, for even though there may seem to be no dust in the air, there usually is, and when it's windy your finished surface will fail to be smooth. It is wise to buy paint a few days before you plan to use it, then turn the can upside down so that it will mix well, since the pigment of paint settles to the bottom. Inverting it will tend to loosen this pigment because of the weight being at the top.

Dress for the job by wearing old clothes that aren't useful for anything else. Before you start a paint job, put

soap or nail-white under your nails, then rub your hands with vaseline. With these precautions, paint will wash off much easier and your nails will be protected surprisingly well.

If the odor of paint is objectionable, place a large can of cold water and a cut onion in the room; both will absorb odors. If interrupted in the midst of a painting job, always put brush in turpentine, and cover paint can, to prevent both paint and brush from drying. If the paint is to be left for some time, it is wise to pour a small amount of linseed oil in the can; this rises to the top and prevents scum. When scum does occur, strain paint through an old silk stocking, or you are likely to have a poor paint job.

Be sure all surfaces to be painted are clean and smooth. Glossy surfaces should be rubbed lightly with steel wool to remove sheen; paint doesn't adhere well to smooth areas. Instead of carrying a large pail of paint about, pour a small amount into a clean tin can, or a cardboard carton such as cottage cheese is sold in. These cartons are excellent for paint containers since the

Housewives welcome a new product that allows them to use the same brush in many colors of paint. No more tedious cleaning!

waxed surface resists turpentine and very little paint is lost when pouring the remainder back into large container. Remember that two coats of paint mean longer wear than one. If the first coat is slightly off color (easily made so by adding a few drops of another color to that used for initial coat) you will be sure not to miss any spots when applying the second and final coat.

Brushes need care, or they will become hard, dry and useless. Turpentine has long been considered the best cleaner, and it still is efficient for the purpose. But because brush-cleaning has always been a tedious process, many brushes haven't had the care they need, and have been ruined. That

is why housewives, in particular, are sure to enjoy a new product that is on the market. With this liquid, the home painter can use her brush in dark green paint, then white, back to green and then to yellow if she wishes. All that is necessary is to dip the brush into the can of liquid a few times and it is ready for re-use. It takes only thirty seconds instead of endlessly working the first color out before the second can be used, and then again before using another. The cleaner is not only harmless to the brush bristles, but preserves them.

If, however, you still use the turpentine method, keep your brushes in the turpentine when not in use, while a paint job is being done. When the task is completed, wash brushes thoroughly with turpentine, then in soap and water; dry them and hang on a hook until another paint job comes up. A properly cared-for brush will look like new when it has been cleaned correctly; bristles will be dry, soft, and free from any stickiness.

There are many little painting tips that make the home job easier. For instance:

Window shades that have become soiled may be painted with a water base, the same shade as the walls of the room, if you can match the color. If not, white is most attractive and makes a nice background for freshly laundered curtains.

When painting around a window, or when painting a narrow edge where you have to be careful not to get paint on the adjoining surface, hold a piece of tin, or stiff cardboard close to the painting surface. Any paint daubs will be on tin or cardboard, and not on the surface you are trying to protect.

When painting screens for windows or doors, thin the paint to avoid filling the holes. Paint helps to preserve screening, so watch it for any signs of rust; and when you see signs, get out the screen paint!

Turn chairs upside down and paint the legs and rounds first; there'll be no overlooked spots if you use this method.

Paint dark cellar stairs with a white strip at the front of the tread to prevent accidents; luminous paint is even better. And instead of painting one side of stairs and then the other so they can be used all of the time, paint every other step; let dry, then paint the others. This will prevent the inevitable line-down-the-middle which results from the half-step method.

If you paint a line on the can the same height as the remaining contents, at any time you will know exactly how much paint each container holds as well as the color.

Remember: No paint job is completed until brushes are thoroughly cleaned and paint cans are tightly covered for storage and later use!

Housecleaning, Here I Come!

By FLORENCE J. JOHNSON

I REMEMBER when I used to wait until the very day I was to start housecleaning before I checked over my supplies — and invariably I'd find that I had to make a trip to town to buy several absolutely necessary items. Now, when that season of the year arrives, I'm all set. Long before, I check my supplies and go from one room to another, checking what is to be done.

I go over my brushes. If it is necessary to buy new ones, they go down on my shopping list. I make out a list of soaps, powders, cleansers, wall paper cleaner, floor and furniture polish, floor wax, moth balls, insect sprays, and the like.

I give my vacuum a good overhauling, put new brushes in my carpet sweeper, see that my scrub bucket hasn't sprung a leak, and I check the stepladder for security.

I lay in a supply of cheesecloth for cleaning cloths, some lintless cloths for polishing. I give my husband the old chamamois for polishing the car, and I buy a new one for the house. A couple of new sponges are purchased also.

I save old newspapers that are fresh and clean. Moths have a decided antipathy for newsprint.

Now I go through the house. I begin with the attic. A couple of tight wooden boxes will be needed for extra storage. I'll see what the furniture store can do to help me. That chest of drawers that has been standing in the upper hall will be brought up to the attic, and I'll use it for my sewing remnants, for the rag rug balls that I am slowly accumulating. And, yes, new curtains for the windows.

In the hall where the chest of drawers had been standing, I will put that extra cedar chest, and fit the top with a padded cover. It will make an attractive seat under the hall window. There's a couple of remnants that will make attractive cushions.

I go through the bedrooms. A new shade for the bedside table lamp in my room; a spot on the rug to be removed. A new garment bag for the closet, and the shoe rack needs painting.

In Sue's bedroom, the dressing-table top needs refinishing. She spilled a bottle of cologne on it. It looks doubtful that the dressing-table skirt will stand another tubbing. I open the closet door and am appalled at the disorder. There is a decided need here for a set of closet boxes of all sizes. I had hoped to see my way clear for a cedar chest for Sue's very own. But now it looks like it will have to be a Christmas gift instead of for her birthday which is coming soon.

Jack's room is to be painted this year, and I note that there are a couple of wall cracks that have to be filled first. Seeing the pile of books on the floor, I make a note also for extra bookshelves.

In the living room, the andirons need extra polishing, some of the pictures on the wall are to be relegated to the attic for a rest period. The lace panels at the windows need a deeper tinting.

In the dining room, the chairs need new covers, and the table top refinishing. Some glass shelves in the sunny window wouldn't be a bad idea either. As for the rug, I look at it dubiously. Would the budget stand the shock of a new rug? If not, maybe the old one could be turned.

In the kitchen, the window sills need a new paint job. I am thinking of painting them in colors to match my decals. Some of my plants need larger sized pots. And I definitely need new curtains. The linoleum on the floor was new the year before. It needs only a good waxing and polishing.

The bathroom needs a new hamper and a new shower curtain, and there are a couple of loose tiles by the tub that will have to be repaired.

For the basement, a good thorough cleaning, a new rubber mat to stand on by the tubs. I look at the rollers on the wringer, and shake my head. Something will have to be done about them.

As I go through the house, I put down notes in a little notebook, and I keep on making additions to my shopping list. My tour over, I sit down and

check and recheck my list.

This year's list was quite long, but I wasn't overwhelmed. I knew there was a fair amount of odd coins put away in the old sugar bowl. I had been adding to its contents since last housecleaning time.

A week ago, my husband came in just as I was putting away some of my most recent purchases.

"Guess spring isn't so far off," he commented. "Saw a robin today."

"Hope there'll be a whole flock soon," I said. "I'm all set. Housecleaning, here I come!"

HOME

By Alma Robison Higbee

Can wealth be measured in dollars and cents

Or on a ledger's meagre face
When a small white square of picket fence
Can encompass a friendly place?

Here the open door lets sunshine in
Or closes against the storm,
Here springtime curtains are crisp and thin
And winter hearths are warm.

Life weaves its pattern the whole day through
With a robin's song for woo, and
And when evening shadows are long and blue
My love seeks this tranquil roof.

Fish Loaf with tomato curry sauce is a flavorful, appealing dish for the Lenten season.

New Fish Recipes for LENT

By FRANCES SMITH

FISH is an excellent all-year-round food, and more and more women are serving it several times a week. Traditionally, however, Lent is the season especially reserved for seafood, and during these weeks all of us are looking for new recipes to add to our files. For there's no doubt about it, fish is easy to find these days even far from fishing ports. Seafood dealers have fish and shellfish in fresh or frozen forms; grocers are well stocked with consumer-size packages of fish fillets in their frozen food lockers. Their shelves are lined with cans of fish—just about the handiest things you can have on your pantry shelf.

More and more, the trend is toward filleting fish and freezing it immediately. There's no waste to a package of fish fillets, and quick freezing seals in the freshness. Freezing, by the way, destroys none of the seafood's goodness—neither flavor nor nutrients. And properly prepared fish has lots of both. Each kind of fish and shellfish has its own distinctive flavor, which adds welcome variety to menu planning. All varieties of fish and shellfish are high in vitamins and protein—an easily digested protein, at that. Seafood is noted for its high mineral content, iodine especially; and some shellfish like clams and oysters are good sources of calcium and iron.

Here are two recipes which use the forms most readily available and easily stored—canned fish and frozen fillets:

PAN-BAKED OCEAN PERCH

Place two 1-pound packages of ocean perch fillets in a glass baking dish. Add salt and pepper to taste. Melt $\frac{1}{4}$ pound butter ($\frac{1}{2}$ cup) and mix $2\frac{1}{4}$ cups cracker meal (one 10-ounce package). Cover the fillets with the butter-crumbs mixture. Sprinkle with chopped parsley if desired. Bake 30 minutes in a moderate oven (350° F.) or until fish is tender and crumbs browned. Serve with pickled onions and beets (if desired). Serves 6. Haddock or flounder fillets may be used instead of perch.

FISH LOAF

1 lb. cooked fish or 2 cups canned fish	$\frac{1}{4}$ teaspoon pepper
1 egg	1 tablespoon lemon juice
$\frac{1}{4}$ cup milk	3 tablespoons parsley, minced
$\frac{1}{2}$ cup soft bread crumbs	3 tablespoons green pep- per, chopped
$\frac{1}{2}$ teaspoon salt	

Drain and flake fish. Combine remaining ingredients, then add fish. Place mixture in greased loaf pan and

bake in a hot oven, 400° F., for 30 minutes. Serve hot with tomato curry sauce.

TOMATO CURRY SAUCE

1 (8 oz.) can tomato sauce	1-2 tablespoons curry powder
1 can water	1 bay leaf, crushed
1 medium-sized onion, finely chopped	2 tablespoons butter
1 tart cooking apple, finely chopped	1 clove garlic, minced
	2 teaspoons salt
	$\frac{1}{2}$ teaspoon ginger

Turn tomato sauce into saucepan. Fill can with water and add to sauce. Add onion, apple, bay leaf, butter and ginger. Add salt to minced garlic (right on cutting board). Rub together with flat side of spatula until garlic is rubbed to a paste with the salt. Add to sauce. Add 1 tablespoon curry powder, saving additional to add at end if heavier seasoning is desired. Simmer gently 20 to 25 minutes; strain. Serves 4 to 6.

The National Fisheries Institute suggests these tasty fish recipes:

PAN-FRIED FISH

2 pounds fillets or steaks, or 6 small pan-dressed fish	1 egg, slightly beaten
1 teaspoon salt	1 cup dry bread crumbs, cracker crumbs, corn meal or flour
$\frac{1}{8}$ teaspoon pepper	Butter, bacon fat or salad oil—enough to be $\frac{1}{2}$ inch deep in frying pan
1 tablespoon milk (or water)	

Cut fish in serving size portions; sprinkle both sides with salt and pepper. Dip fish in mixture of milk and egg; roll in crumbs. Heat fat in heavy frying pan; when hot but not smoking, fry fish at moderate heat. When brown on one side turn carefully and brown other side. Total cooking time about 10 minutes, depending on thickness of fish. Remove from pan, drain on absorbent paper. Serve immediately on hot platter, with lemon wedges and Tartare sauce.

FISH FLAKE OMELET

2 cups flaked fish	1 tablespoon minced parsley
2 tablespoons lemon juice	$\frac{3}{4}$ teaspoon salt
4 eggs, separated	$\frac{1}{8}$ teaspoon pepper
$\frac{1}{2}$ cup milk	2 tablespoons butter
2 tablespoons minced onion	

Add lemon juice to fish. Beat egg yolks thoroughly; stir in milk, onion, parsley, salt and pepper. Add fish, mix well. Fold stiffly beaten egg whites into mixture. Melt butter in smooth heavy frying pan and when hot, pour in egg mixture. Cook over low heat until delicate brown on bottom (about 10 minutes). Place in slow oven 300° F. about 10 minutes, or until top is firm and dry to the touch. Cut part way through omelet at center, fold in half and slip onto heated platter with pancake turner or spatula. 6 servings.

DANBURY COOK WINS COUNTY FAIR PRIZE

Walter Crookes proudly helps his mother, Mrs. Chester B. Crookes, add another blue ribbon to her growing collection. Mrs. Crookes is getting to be one of Connecticut's most consistent prize-winning cooks, having carried off a prize 2 years in succession at the Danbury Fair. "Of course, it takes practice to be a good cook," says Mrs. Crookes, "but it also takes the best ingredients. You just have to use the best to make the best and that's especially important when it comes to yeast. When I bake at home, I never use any yeast but Fleischmann's. It's so fast and lively all the time. I know from experience I can count on Fleischmann's to give me grand results."

It's true! Prize-winning cooks prefer Fleischmann's Yeast to all others.

FLUFFY, TENDER BISCUITS!

■ No need to risk costly ingredients . . . no need to disappoint your family in the treat you promised! For here is your secret of delicious homemade biscuits that are light as a feather every time . . .

Double-acting Davis gives double protection. Dough rises in your mixing bowl . . . then again in your oven.

"Freed from NERVOUS WORRY"

"My nervous state was due to drinking coffee. Switching to POSTUM calmed me—I stopped worrying and began to really enjoy life!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine—a drug—a nerve stimulant. So, while many people can drink coffee or tea without ill-effect—others suffer nervousness, indigestion, sleepless nights . . . POSTUM contains no caffeine or other drug—nothing that can possibly cause nervousness, indigestion, or sleeplessness.

MAKE THIS TEST: Drink POSTUM exclusively for 30 days—judge by results! . . . INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran.

SPREAD ON BREAD

"NO LONGER NERVOUS!"

Switching to
Famous Cereal Drink
Brings Natural Relief

Jittery?... Irritable?... Can't enjoy life fully?... People everywhere—people who once suffered just as you do—have found the answer in switching from coffee and tea to POSTUM.

EXAMPLE: A woman in New York City writes this sincere and moving letter: "My switch to POSTUM has given me a new lease on life! I no longer fear the sleepless nights and the nervous tired feeling that made life a bore!"

SCIENTIFIC FACTS: Both coffee and tea contain *caffein*—a drug—a nerve stimulant! So while many people can drink coffee or tea without ill-effect, others suffer nervousness, indigestion, sleepless nights. But POSTUM contains no *caffein* or other drug—nothing that can possibly cause nervousness, indigestion, sleeplessness!

MAKE THIS TEST: Buy INSTANT POSTUM today—drink POSTUM exclusively for 30 days. See if POSTUM doesn't help you, too, to sleep better, feel better, enjoy life more!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

Personal To Women With Nagging Backache

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

LOOK for Rupture Help

Try a Brooks Patented Air Cushion appliance. This marvelous invention for most forms of reducible rupture is GUARANTEED to bring YOU heavenly comfort and security—day and night—at work and at play—or it costs you NOTHING! Thousands happy. Light, neat-fitting. No hard pads or springs. For men, women, and children. Durable, cheap. Sent on trial to prove it. Not sold in stores. Beware of imitations. Write for Free Book on Rupture, no-risk trial order plan, and Proof of Results. Ready for you NOW!

AMERICAN AGRICULTURIST
RENEWED

Fashions for All

No. 2038. Casual, cuffed shirtwaister styled just right for smartness! The slimmer skirt is pleated for graceful movement. Sizes 12-20; 36-44. Size 18, 3 3/4 yards 39-inch fabric.

No. 2094. Pocket-edition of the pinafore duet—easy-entrance buttons from armhole to hem, sweetheart of a neckline, and gathered skirt. Sizes 6-14. Size 8, 3 1/4 yards 35-inch fabric.

No. 2093. The grown-up half of mother-daughter pinafore fashions. Delightfully easy to make, wash, iron—and wear! Two jumbo size pockets. Sizes 12-20; 36-42. Size 18, 5 3/4 yards 35-inch fabric.

No. 3502. Behold the young lady's bowed and beribboned dress! It has a basque bodice that buttons right down

to its dirndl-type skirt. Sizes 4-10. Size 8, 2 3/4 yards 35-inch fabric.

No. 2113. Current fashion points to the bodice—as does this dress, via the cleverly pointed collar, the front trickle of buttons! Sizes 10-20. Size 16, 3 3/4 yards 39-inch fabric.

No. 2007. The scalloped calot and its matching bag will make a clever contrast with your ensemble. Cut in one size, adaptable to any head. Both, 3/4 yard 35-inch fabric.

TO ORDER: Write name, address, pattern number and size clearly. Enclose twenty cents for each pattern wanted. Add 20 cents for our new Spring Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

NEW CUFFS FOR SWEATERS

Children have a way of wearing out the cuffs on their sweaters first. When a thread breaks, the cuff often starts to ravel, even when the rest of the garment is good. Cut off the cuffs of a pair of canvas work gloves and attach them in the place of the worn sweater cuffs. In most cases the sweater can be matched perfectly in color, making it neat and like new again.

—A.A.—

NEAT DARN

Even the best of husbands may come home with a three-cornered tear in his best wool trousers. It is easy to catch them on a nail, fence or rough chair. But if the material in them is still good, they may be mended neatly with a careful hand darn that will be practically invisible.

Work carefully and with little stitches. Darn each side as though it were a straight tear. When you do it this way the two straight darns will overlap at the corner and give extra strength there where it is most needed.

If it is at all possible, reproduce the original weave in the garment. You can best do this by taking matching

threads from the seams.

For best results work this darn over net or a piece of cloth laid on the under side for extra strength. Be sure you work with special care at the corners so the mend will not be bulky or show.

—B. C.

—A.A.—

TRAINING FOR NURSING

ANY girl who is planning or hoping to attend a school of nursing will be interested in the exceptionally good courses offered by three New York State Colleges—Keuka College at Keuka Park; Alfred University at Alfred; and Hartwick College at Oneonta. These courses will appeal particularly to girls who want to prepare themselves to serve rural areas in small communities.

The courses include fine educational background with nursing experience under skilled teaching and guidance. The National Committee for the Improvement of Nursing Service has just issued a statement classing these three colleges in the upper 25% of nursing schools in the United States for programs in basic nursing training.

For further information write to any of the colleges or to Mr. C. M. Plaisted, Director of Public Relations at Keuka College, Keuka Park, New York.

PLANT FOOD: Yours for the asking from the Plant Food Division, SWIFT & COMPANY, Chicago 9, Illinois, is a 16-page booklet giving complete facts about "Blenn," one of the fertilizers put out by SWIFT.

MOVIES: If you are interested in getting movies for your farm meeting in your neighborhood, drop a postcard to J. I. CASE COMPANY, Racine, Wisconsin and ask for a copy of their booklet "Case Visual Education Materials" or ask your CASE dealer for the address of the nearest branch office where they are available.

WASHDAY: The SPEED QUEEN CORPORATION, 48 Doty Street, Ripon, Wisconsin, will be very glad to send you a free booklet written by one of the firm's customers entitled "How I Washed 7 Loads Per Hour."

SELF FEEDERS: One of the newer developments in feeding livestock is self-feeding barns, silos and cribs. Free literature on this new development is available from MARTIN STEEL CORPORATION, 435 Longview Avenue, Mansfield, Ohio.

ALMANAC: A 68-page Farmer's Handbook and Almanac has been published by The E. F. GOODRICH COMPANY in a 1950 edition and is available without cost upon request to principal headquarters in Akron, Ohio.

COUPONS: Advertisers in AMERICAN AGRICULTURIST are glad to send information to any subscriber. To make it easy to ask for this information, many of them use coupons which you can fill out in a moment and drop in the mail. Get the coupon habit! Manufacturers of farm equipment supplies are continually developing new things, and the booklets which they put out are one of the best means of learning about them.

GUIDE: The MASSEY-HARRIS Buyers' Guide now ready for distribution, has 36 pages, is printed in 4 colors and includes photos and descriptions of nearly all the company's farm machinery and implements. To get a copy of the Buyers' Guide, write to MASSEY-HARRIS COMPANY, Dept. B, Racine, Wisconsin.

A "Combination" Range—one that will cook and bake either with oil and electricity or coal and electricity. It is now available from KNOX STOVE WORKS, 2011 Ailor Avenue, Knoxville, Tenn. It also gives forced warm air for room heat. You can get a folder which gives a complete description of this MEALMASTER COMBINATION RANGE by dropping a postcard to the above address.

FLOWERS for Busy People

(Continued from Page 1)

popular and now a climbing Peace is listed in the catalogs. Four have been chosen by the All-America Rose Selections for 1950; they are:

Fashion—a floribunda rose of glowing coral-pink color suffused with golden light.

Sutter's Gold — hybrid tea of golden nugget color, tea scent, long stems and good foliage.

Capistrano — hybrid tea with huge, rich rose-pink flowers.

Mission Bells — hybrid tea which mingles gold with its glowing salmon-pink, richly perfumed, high-centered blooms.

The fact that a rose is new does not mean that we should discard the good old ones . . . for instance, Frau Karl Druschki, that wonderful white rose of such perfect form. Perhaps the easiest rose for busy people to grow is the floribunda or cluster-flowering group; they are hardy and are available in single or double forms, large or small flowers.

I like to have enough new things in my garden each year to keep me wondering how they will look; on the other hand, a tree or shrub takes a long time to come into its full beauty and should be planted with that in mind. Furthermore, it should be given plenty of room for sunlight and free circulation of air all around.

Perennials and Annuals

The favorite easy-to-grow perennial flowers listed—without going too much into variety names—were hardy asters, anchusa, achillea, lilies (Henryi, regal, speciosum, madonna and centifolium), chrysanthemums, hardy phlox, Oriental poppies, iris, daylilies (hemerocallis), veronica, statice, peonies and sweet

violets. An established garden would have many of these already, but new ones add to the thrill of gardening.

Most perennials bloom early in the season, so we have to depend chiefly upon annuals for summer and fall color. When I heard from the firms who deal in annual seeds, they placed zinnias at the top of the list of best sellers, petunias next; then marigolds, snapdragons, asters, annual phlox, pansies, nasturtiums, morning glory, portulaca, alyssum, strawflower, cosmos and geranium (from seed for indoor and outdoor plants).

It is no wonder that zinnias top the list. They come in such a variety of forms and color and are useful indoors and out. A new one, Floradale Scarlet, besides being a fine red giant, is less stiff and formal than the usual zinnia—this makes it nice in arrangements. The tiny lilliput zinnias have their place too, on small tables and the like, but the cut-and-come-again varieties which grow about 2 to 2½ feet high and come in a great variety of colors, available in mixture or in separate colors, probably fill the most uses.

Petunias are next—and no longer is there any excuse for a motley array of magentas and poor whites—there are so many fine colors available and reasonably priced.

Fire Chief Petunia, this year's Gold Medal Winner in the All-America Selections, is the first to win a gold medal in twelve years. Yet a packet of its seed is listed at 25 cents in the catalogs. It is dwarf and compact, and easy to grow. When you try the fancy double ruffled giants, that takes more skill and care; seed for these doubles requires hand pollinating, making them

more expensive, but they are worth the money and the trouble!

Balcony or large-flowered bedding petunias are easily-grown favorites. They are particularly good to cover bulb beds, since their roots are shallow. Their long stems make them valuable for cutting. It is best to start petunia seeds indoors 6 to 8 weeks before transplanting outdoors. Otherwise, they get started too late to bloom when needed the most. If time is no object, they can be planted outdoors as soon as the ground warms up.

Marigolds, from the tallest African to the smallest pygmy forms, offer variety in height, form, and color and are very easy to grow. The heavy-headed, chrysanthemum-flowered ones and large doubles will need to be staked. The French ones are smaller and not so likely to have stalks broken or split in storms. The very dwarf forms are fine for rock-garden fillers after bulbs and early perennials have finished; also for edgings.

Those annuals that can be planted where they are to grow and then thinned have great appeal for me. Alyssum (Carpet of Snow) is one; it often seeds itself and just needs replacing in the thin spots. Portulaca is another that will do this, but I get earlier results by starting seeds indoors. Bachelor's button and larkspur yield satisfactory results by the thinning out method. Nasturtiums, if spaced carefully, will not even have to be thinned. They, too, are good for planting between bulbs.

I know many farm women whose only cut flowers are planted in the vegetable garden, thinned to a stand, and there you are! Start with well-prepared soil, fertilize occasionally, give water in dry spells, and you'll have flowers for your bowls all summer. The vegetable garden has to be cultivated any way!

I have not mentioned gladioli—and

LIFE'S SUM

By F. H. EHLING

Count your garden by the flowers,
Never by the leaves that fall;
Count your days by golden hours,
Don't remember clouds at all.
Count your nights by stars, not shadows;
Count your days by smiles, not tears,
And with joy through all your lifetime,
Count your age by friends, not years.

(Editor's Note: The writer of this poem, with its fine philosophy, is 94 years old. His friend, Mr. George S. Jephson of Cazenovia, N. Y., sent the poem to us.)

some of them are so exquisite that they stop me in my tracks! Nor have I mentioned dahlias; they have to be set out in spring and dug in the fall. If your vegetable gardener can find time to help with the job, by all means have him. And if he still feels helpful, cannas have moved up into the top class. I saw a row of bright red ones in front of a forsythia hedge planted to screen a big bare barn wall. The yellow forsythia was lovely against the white barn and later formed a green wall behind the red cannas.

Famous hotels up in New Hampshire get stunning results by broadcasting a mixture of annual seeds in borders—that's an idea for those with a yen for color and little time for gardening.

Lovers of morning-glories will like the little dwarf ones, about a foot high, useful for borders, rock-gardens and edgings. They come in mixed colors or in deep blue.

Sweet peas, though I do not rate them in the "easy" class, are a favorite farm flower and many people are very successful with them.

... A TRUE COMBINATION RANGE THAT'S REALLY NEW FROM THE FLOOR UP!

Mealmaster

COMBINATION OIL • ELECTRIC COAL • ELECTRIC RANGE

Yes, ladies . . . here's the combination range that you've been waiting for . . . Mealmaster, the wonder range that not only cooks and bakes with both fuels but furnishes you forced warm air for room heat too. See the new Mealmaster Oil • Electric Combination or Coal • Electric Combination at your dealer; or write Knox Stove Works, 2011 Ailor Ave., Knoxville, Tennessee for free illustrated folder.

THE YOUTH'S COMPANION

The Hole in the Vault

By CHARLES G. D. ROBERTS

FOREWORD

In this hair-raising adventure story, taken from the YOUTH'S COMPANION of September 1892, three young men determine to solve the mystery of a subterranean tunnel, deep in the heart of a bleak mountain.

THROUGH North Mountain, from Melvern Square in the Annapolis Valley to the village of Margaretville on the Bay of Fundy coast, runs a deep pass known as "The Vault." On the bleak summit of the mountain, a little to the right of this pass, is the opening which goes by the name of "The Hole in the Vault."

The mountain pass in question bears no resemblance to a vault of any kind. Deep and secluded it is, indeed, but its depths are lovely with rich foliage, and into them the sunlight streams cheerily. The mountain top, about four hundred feet above the sea, is for the most part naked rock. In the hollows of the rock once grew pines and firs, but the fire went over the height, and all that remains is a desolate fringe of winter-bleached and ghostly trunks on whose tops the fish-eagle finds a perch, and screams across the valley and the Bay.

The mouth of the cave is a round hole about six feet in diameter, cut smoothly, as if by the hand of man, out of the solid rock. Tradition, of course, ascribes it to the omnipresent pirate, Captain Kidd, who is held responsible for many freaks of nature on the North Atlantic coast.

At first sight, the Hole resembles nothing so much as a well. It descends perpendicularly for about twenty feet. Then it runs in a sort of gallery, almost on a level, for a distance of perhaps twelve feet farther.

At the end of this tunnel there is another abrupt descent, and the passage plunges into the bowels of the mountain. As to its depth there are conflicting conjectures—nothing really definite.

Standing at the inner end of the lateral tunnel, which we may call, for convenience, the gallery, one may throw stones down the shaft and hear them rebounding from side to side till the last faint echo dies away. Certain keen listeners have believed that they caught, ultimately, the sound of the stone falling into water, and have assumed that the shaft ends either in a subterranean pool, or in a chamber to which the tides of the bay find access.

There is a tradition that an experimenter once took several blocks of dry wood, painted them in bright colors, marked them with the date and place, and dropped them down the shaft; and it is said that one of these blocks was picked up, a few days later, floating in the Bay near Margaretville.

But the evidence on this head seems to me inconclusive.

A few years ago, two students of King's College, at Windsor, who were spending the summer vacation in the Annapolis Valley, resolved to attempt a solution of whatever mysteries the "Hole in the Vault" might contain. The farmers of the neighborhood endeavored to dissuade them, saying that the Hole was full of bad gasses that would stifle them, but their imaginations were aflame and they would not be turned

BOSTON, THURSDAY, SEPTEMBER 29, 1892

from their purpose.

They found a young fellow in Melvern Square who knew the place and could enter into the spirit of their enterprise.

Their preparations were made with the utmost forethought. They took several miner's lamps, an abundance of rope and cord, an axe, a light pick, and other apparatus. The leader of the expedition, a young man now in business at Halifax, has described the whole adventure to me minutely, and I cannot do better than repeat his words as accurately as I can recall them:

"Joe Gillespie was the name of the young fellow we got to go with us. He was a good man, and full of the scheme. He came for us with his team about six o'clock in the morning and would hardly give us time to eat our breakfast.

"We drove to the 'Vault,' and then off into a desperately rough wood road which took us nearly half-way up the mountain. When the road became impassable, we unhitched the horses and tethered them, shouldered the ropes and the rest of the stuff, and set out for a climb.

"It was about half past nine o'clock when we got to the top, and looked down in the 'Hole.'

"Close to the edge of the cavity stood an old pine trunk, hard and solid as a rock. To this we fastened one end of the rope, and also one end of a light-cord which we had with us. We dropped the ropes, pick, and so forth to the bottom of the first part of the 'Hole,' stuck the lamps in our hats, and climb-

ed down hand over hand.

"I forgot to say that we also dropped in a stout spruce pole, the use for which you will see presently.

"We found the gallery dry and smooth. We tossed a few stones down the shaft, and listened until they vanished out of hearing.

"'Guess they must have gone clean under the Square!' remarked Gillespie, while Dick, who favored the tradition of a passageway to the Bay, declared that the reason we heard no splash was that the tide was out. I maintained a judicial silence.

"Across the mouth of the inner shaft we set a length of the spruce pole, wedging the ends firmly in the rock. In the middle of this bit of timber we cut a shallow groove, smoothing it nicely; and round it we took a half-turn of the rope.

"To the loose end of the slender cord we attached a lighted lamp. This we lowered away for some distance, and finding that it burned clearly, we knew that the air in the shaft was pure.

"I told you so," said Dick. 'Fundy air is always pure!'

"Now came the question as to who should venture down the 'Hole.' Gillespie was anxious to go, but Dick said he had a prior claim. Finally I announced that, as I had planned and worked up the whole thing, I was going to do the exploring myself.

"This was just what the boys expected, so there was no more discussion, and I don't believe they were desperately anxious anyway to take my place, for the shaft was a discour-

aging thing to look at.

"I knotted the rope securely and comfortably about my body, took the cord in one hand and the pick in the other, and told the boys to lower away, very gently.

"The cord served a double purpose. At the end of it, some six or seven feet below me, hung a lamp, as a safeguard against descending into 'choke damp.' As long as the lamp was burning clearly I could tell that there was no bad gas immediately beneath me.

"The cord also served as a means of communication with the surface. It was agreed that one sharp jerk on the cord should mean 'stop'; that two jerks should mean 'lower away'; and three jerks 'pull up.' Four jerks were to mean 'pull up in a hurry,' and five jerks 'not so fast.'

"This was the code, and each carried a written copy to avoid possibility of mistakes.

"In another minute I was slowly descending the shaft, using the pick against the walls to steady myself and to stop the rotary motion of the rope, which threatened to make me dizzy. The pick was a light, handy affair, half way between an ordinary pickaxe and a geologist's hammer. It was attached to my belt by a piece of cord, in case I should wish to have both hands free.

"For thirty or forty feet the descent was practically perpendicular, and the sides of the shaft, smooth and dry, presented no points calling for comment. Then the passage began to slope a little, away from the mouth of the pit, and the walls changed their character. Here and there a tiny thread of water oozed from a crevice and spread over the rock, glistening in the light of my lamp.

"Sometimes I found the rock so soft that I could break off specimens with my fingers. These I put into the leather bag which I carried. Sometimes I passed thin veins of a milky stone which I recognized as quartz. At these I would give the signal to stop, while I hammered off lumps in which I thought might perhaps be found traces of gold.

"Once or twice I was startled by the drip of water upon me from above, or by the fall of some little scraps of rock, loosened by my pick or by the friction of the rope. Of such occurrences, however, I took but little heed, for the quartz veins looked very promising, and I had procured several nice amethysts, such as used to be found occasionally at Blomidon.

"Moreover, the passage remained easy and the air pure.

"When I must have been at least ninety feet from the surface, I came to a steep incline where I might almost have dispensed with the support of the rope. I kept my weight upon it steadily, however, so as not to confuse my assistants.

"At this spot the sides of the shaft were much broken. The rock seemed loose and shelvy, and numerous tiny springs forced their way through its crevices. The slope of the shaft brought the rope hard against this treacherous surface, and presently a shower of fragments rattling down on my head and shoulders awoke me to a possible peril.

"I glanced up with sudden dread; and just as I did so a slice of rock, weighing many pounds, pitched downward not a foot from my right shoulder,

Big Game Hunting

(Continued from Opposite Page)

flashed its wet side noiselessly in the lamplight, struck and carried away the lamp that was swaying beneath me at the end of the cord, and thundered heavily into the unknown depths.

"The sudden jerk on the cord was taken as a signal by Dick and Gillespie, and my descent came to a stop.

"For a moment my heart almost ceased to beat. I can never describe the horrible nightmare of that noiseless fall through the dim light. The sound of the crashing far below, startling as it was, came as a positive relief.

"For a moment I was undecided. Then I considered that what had just happened would probably be repeated. The sides of the cavern were rotten. I could not tell what movement my pick might have started; and there was the rope, continually aggravating the mischief by pressing hard against the treacherous wall. There was but one thing to do. I gave three sharp tugs at the cord—the signal to pull up.

"It seemed as if the answer would never come. Then I began slowly to ascend. A small stone dropped on my hat brim, and my impatience increased. The gulf below became suddenly horrible, hideous, loathsome to me, and I would not look downwards.

"I gave four jerks at the cord, and began ascending with a speed that threatened to knock my brains out on the walls of the shaft. The rope spun round, and hands and feet were kept busy in the effort to steady myself.

"Some more bits of rock pattered down, and convinced me that such a speed was too dangerous. Very reluctantly I signalled, 'Not so fast.'

"The pace slackened just as I was on the edge of a slope. Right over my head the roof of the shaft, seamed and dripping and ragged, hung ominously. There was the weak spot. If only I could get safely past this ragged projection, I should have a clear way back to the upper air.

"I watched the perilous masses breathlessly, as foot by foot I mounted, using my feet to relieve the friction of the rope.

"Then I thought I saw a trembling in the rock! There was a hideous grinding noise, and the passage above me seemed to contract and close up. A shower of fragments fell thickly about me, bruising my head and hands and shoulders, and putting out the lamp in my hat.

"The rope stopped rising. I hung, swaying gently, in a darkness that seemed to choke me.

"I knew well enough what had happened, but for some minutes was, perhaps, semi-stupefied. Dully I said to myself, over and over again, 'This is my tomb; this is my living grave!'

"But presently my energies reasserted themselves. I felt my limbs. I was unhurt and strong. Surely I could do something—and Dick and Gillespie would find a means to bring help.

"This last thought sent a wave of fresh terror through my heart. I knew just what Dick and Gillespie would do. They would bring men and ropes and picks, and some one would descend the shaft and try to dig through to where I was, and then the mass which had closed in above me would give way under the pressure and the blows, and I should go with it—down, down, to the heart of the hills; and perhaps, some day, my dead body would be washed out, through strange sinks and arteries of that under-world, to the open tides of the Bay.

"I realized that I must help myself before my comrades should have time to attempt a rescue.

"Both rope and cord were fixed immovably. With some assistance from the rope, but mainly relying upon my feet and one hand, I worked my way up the incline till I came in contact with the mass that had imprisoned me.

Here I shortened up the rope so that it would support me and leave both hands free.

"I tried to relight the lamp, but it was too thoroughly shattered. However, I lit match after match, and took a careful survey of the task that confronted me.

"I saw that a broad shelf of slaty rock had dropped from the roof of the slope and shut down across the shaft like a portcullis.

"The main thickness of this mass, however, proved to be somewhat narrower than the shaft. At the left side there seemed to be almost a passageway. The weight of the mass was evidently supported at the top and bottom, and on the right hand side.

"I attacked the thin spot with my pick, and soon made myself a clear space to work in. It was stifling work, but the stone was brittle, and I was in desperate haste.

"After perhaps a half hour's labor I found that I had made my way a good three feet past the lowermost edge of the obstruction. Descending and leaning my weight entirely on the rope, I lay on my back a few minutes and rested.

"As I lay I was tormented with the thought that perhaps that mass above my head was forty feet in thickness. It might as easily be forty feet as four, I mused. Well, if so, all the more need to make haste, I said to myself.

"I rose and went back to my work in a fever of impatience. I lit a match in order to get a clear idea of what I wished to do. As the match went out, and while it still glimmered, a red coal on the rock before me, I struck a vigorous blow above my head,— and the pick went through!

"The revulsion of feeling was so strong that I leaned for a moment against the rock, and strange lights chased each other before my dilated eyes.

"In a few minutes I had cleared myself a path to the other side of the barrier. This accomplished, I felt safe.

"The rope, of course, was still jammed immovably under the rock. I cut it and fastened the freed end about my waist. Then I gave the signal to pull up. It was responded to instantly.

"But presently I perceived the speed slacken. I reflected that probably there was now only one man hauling on it. No doubt when the boys discovered that the rope was fast, they would have inferred that the walls had caved in, even if they did not hear the crash, and Gillespie would have gone for help and left Dick to watch the rope and cord.

"I gave the signal to stop, and commenced ascending hand over hand. I made about forty feet in this way, then took up the loose rope, made it fast, and once more gave the signal to pull up.

"In a few seconds I saw a glimmer of light, and then I was dragged over the brink, into the gallery, and Dick was almost hugging the life out of me in his delight at my safe return.

"We were not long, I can tell you, in making our way to the upper air. What an indescribable relief it was when we found ourselves clear of that deadly shaft!

"When the rescue party, gathered by Gillespie, arrived upon the scene, Dick and I were eating our lunch comfortably on a stump. When my story was told, certain of the farmers, after remarking, 'I told you so,' in every possible key, took their axes and cut down a large number of dead trees, which they dumped into the 'Hole.'

"On top of these they rolled such loose rocks as they could find; and now it will cost a lot of labor and some money to any one who may wish to follow my example, and risk a repetition of my experience in 'The Hole in the Vault.'"

SPECIAL CORNELL FARM and HOME WEEK Broadcasts—March 20-24

Kernels, Screenings and Chaff

By H. E. BARCOCK

LAST night, with Professor and Mrs. Clarence Lee of Beacon Mills, Mrs. Babcock and I sat in on a most thrilling and unusual telephone conversation. The scene was the Miami apartment of the greatest man the poultry industry ever produced. No, that's wrong. It was the apartment of the man who made the poultry industry of America what it is today—beloved Jimmy Rice, one of the most inspiring teachers and leaders of men this country has produced in any field of activity.

Well along in his eighties, and handicapped only by failing sight, Jimmy was as dapper and alert as ever when he answered two short rings on the telephone and found himself connected with far-off Kansas City where Cliff Carpenter, president of the Institute of American Poultry Industries, was speaking to him in behalf of some 1,200 diners. They had gathered to pay Jimmy tribute and celebrate the raising of more than \$25,000 to establish at Cornell the James E. Rice Memorial Library.

After Cliff talked with Jimmy for a couple of minutes, four or five other leading poultrymen in the United States came on the wire in succession to exchange pleasantries and to salute the man whom poultrymen everywhere recognize as the fellow who put foresight, science and spizzerinktum into their business.

As these outstanding national figures came onto the wire, Jimmy recognized them instantly and in the exchange of repartee kept them off balance and in a respectful mood by his rapid recital of incidents from their early days which, I am sure, he remembered better than they did.

Last to talk to Jimmy was his own son, John, one of the three Rice brothers (Paul, deceased, Jimmy and John) who have carried on their father's work and made the Rice Egg and Apple Farm at Trumansburg, N. Y., one of the country's leading Leghorn breeding and hatching establishments.

While obviously bursting with pride, Jimmy immediately cut John down to size by reminding him of the various lickings he had given him in his youth. Then they visited about the family—the present Mrs. Rice was called to the 'phone to say "Hello"—the three Rice girls, Ruth McMillan, Alice Paddock, and Betsy Rice were mentioned.

As the conversation progressed, it was obvious that proud as Jimmy is of his lifelong work and of the acclaim accorded him by the leaders of the poultry industry, and of the new memorial library in his honor, the real core of his life's satisfaction lies in the character and accomplishments of his splendid family of boys and girls.

A fortunate man, Jimmy! He has lived long enough to see his enthusiasms and his ideas come to a crest here in the United States and spread throughout the world. He has seen his sons make good on their own, on the farm and in the industry he founded. He has abundant evidence of the affection and respect in which poultrymen everywhere hold him. And now, through the efforts of these friends, he is witnessing the establishment of a great memorial library in his honor at his beloved Cornell.

GRASS SILAGE REPORT

WHEN I undertook last summer at Sunnygables to store grass silage in a trench silo — really a road dug up through a steep bank with a steam shovel—I promised to report here on the quality of the silage when the silo was filled and as it was fed out.

In order that my report might be entirely objective and reliable, I arranged with the Cornell School of Nutrition to do the sampling and the analyses of the samples.

Under date of February 11, 1950, I have a report from the School on five samples of silage taken from the trench on the dates shown. Note that the first sampling was in August 1949, shortly after we completed filling the trench, and that subsequent samples were drawn in September, November, and December 1949, and January 1950, while we were feeding the silage.

as the critical point beyond which the quality of the silage goes down quite rapidly. You will note from the table that the pH of the silage in the trench was pretty good.

WATER CONTENT

The dry matter content of the best grass silage should be right around 30 per cent. You will note that our water content is from three to eight per cent higher than ideal. In addition, we lost quite a lot of water by seepage and when we analyzed the juice which ran off, we found it contained some digestible dry matter, particularly protein, which we would rather not lose. I have therefore decided to go back to wilting the alfalfa and brome grass from which we make our grass silage. *If we cut it when we should in the spring, it is just too high in mois-*

SUNNYGABLES TRENCH SILO (Wet Basis)

Sampling dates	Aug. '49	Sept. '49	Nov. '49	Dec. '49	Jan. '50
pH (acidity)	4.1	4.1	4.2	4.2	4.7
Water content—%	74.4	73.5	78.6	78.6	77.5
Carotene—mg/lb*	12.00	11.0	16.6	13.2	11.6
Protein—%	3.8	3.8	3.2	4.1	3.4
Crude Fiber—%	7.4	7.4	6.8	8.7	7.1

*mg/lb—milligrams per pound

In taking the samples, the representative of the School was careful to get an average lot from the whole exposed face of the silage. This was important in the trench silo because, unlike in a tower silo in which the oldest crops are on the top, in a trench the exposed face represents a cross-section of the age of the grass from which the silage was made.

In addition to giving a picture of the silage in our trench at Sunnygables, the figures in the accompanying table, compiled by the Cornell School of Nutrition, give an idea of the factors which are considered important in determining the quality of grass silage.

CONCLUSIONS

From the above figures I draw the following conclusions to guide us at Sunnygables in putting up grass silage during the spring and early summer of 1950. We have now decided to fill our trench about two-thirds full of unchopped grass and the rest with chopped grass, so that we can get some idea of both the work involved and the quality of the silage when put up chopped and unchopped.

ACIDITY

We are told that the ideal pH or acidity of grass silage should run from 3.7 to 4.1, with 4.5

ture content (we have had samples run up to 84.5%) to make into silage without wilting. This extra water content makes too much tonnage to lift around. It causes excessive run-offs and it results in silage too high in water content.

CAROTENE

The carotene content, one of the most important qualities of grass silage, is too low in our silage to satisfy me, although it is about twice the average figure for corn silage. I wonder if we would not have had a higher carotene content if we had not had such a run-off of juice? I also think that we filled the trench too slowly and therefore got too much heating.

PROTEIN AND FIBER

The protein and crude fiber figures in the accompanying table speak for themselves. They are good.

BASE FIGURES

At Sunnygables we are very glad to have the figures in the table. They prove that good grass silage can be made in a trench silo, and that it stays good. But most important, we now have a set of figures with which we can work to put up better and better grass silage each year as we also strive to cut down on the cost of harvesting and storing it.

FROZEN MILK

RECENTLY, I called attention to a new milk product — *frozen concentrated fresh milk*. Since then, I have taken some pains to run down the possibilities of this new method of marketing milk.

It is just possible that we are on the verge of a marketing revolution which will upset our present milk marketing cart and scatter spilt milk and broken glass all over the map.

For years the marketing of fresh milk has been building up for a big crash. Expense after expense has been added and increased between the cow and the milk in the family refrigerator, until the consumer price of fresh milk has become highly vulnerable while the producer price is shamefully inadequate to insure a long-time quality supply of

nature's most wonderful food.

Examples of what I mean are: (1) the cost involved in handling the cases, the glass, and the ice which are a part of the traditional delivery of fresh, bottled milk; (2) the constantly increasing labor costs connected with all phases of fresh milk handling. These costs have been built up by the unions which cannot be blamed for trying to do a job for their members but which quite possibly have done too good a job. (3) expensive and conflicting and non-essential sanitation requirements which do not result in a better product.

A LOWER PRICE IMPORTANT

The cheaper fresh milk can go to consumer, the better it will be for all dairy farmers in the long run. In the marketing of any agricultural product, volume is important. We have all seen

cases where the retail price of a farm product, either because of natural or artificial conditions, got so high that it choked off purchasing, always with disastrous results to producers.

If fresh milk can be concentrated and frozen without losing any of its natural flavor or nutritional qualities, I, for one, am not afraid of what will happen to the money I have in dairy farms and dairy cattle. *I think it will just become a safer investment.*

If a new method of marketing milk does develop, I would like to put in a plug for one important reform. Dairy-men should not be asked to finance it by providing the processors with from one to two months' credit on the milk they sell. Do you know any other industry which farmers finance the product to the extent they now finance the marketing of milk?

Service Bureau

By H. L. COSLINE

WANTED!

THE TWO pictures above, while very poor, are the best available. The man is Lincoln Pettit who disappeared from his home in Monroe, Conn., abandoning his wife and children. He is described as 38 years old, 5 feet 7 inches tall, weighs 175 pounds, and when he left he was driving a 1936 green Ford Sedan with Connecticut registration UE-210.

The girl is 13-year-old Karen Christine Kirby, described as 5 feet 4 inches tall and weighing 120 pounds. She was abducted by Pettit and the Connecticut State Police have a warrant for him and will extradite him anywhere in the country. They believe that he is either on some farm in the Saratoga County, New York, area or in some other farming area.

Any reader who has information about this man will be doing a service by communicating immediately with Edward J. Hickey, Commissioner of State Police, 100 Washington Street, Hartford, Conn.

— A.A. —

A LOTTERY

I have been trying to save a set of box tops in order to win a prize. I have been trying for a long time but I have never been able to get a complete set. Is this a 'gyp' deal?

It is the common understanding that distributors who offer prizes for a set of box tops, wrappers, or packages control the number of prizes given by sending out a limited number of packages containing one particular number or letter. That is why it is difficult to get a complete set. The National Better

Business Bureau points out that this type of a sales stimulator is a lottery and, therefore, illegal because it involves prizes, chance, and cost; that is, something must be bought.

— A.A. —

PLAY IT SAFE

I bought 600 chicks from a hatchery in Iowa. They arrived in very poor condition. Some were dead on arrival, and others died soon after. Although they guaranteed satisfaction, they would not refund my money. They offered to replace half of the chicks, but I don't want any more chicks from them. The magazine in which I saw the ad hasn't been able to get any better adjustment, and I would like your help.

Much as we would like to help our reader, it would be useless to try. We have found that a farm paper can always get a better adjustment from an advertiser than it can a non-advertiser. Therefore, if the magazine mentioned by our reader was unsuccessful in arranging a satisfactory adjustment, there is no hope that we could do anything. Anyway, why send all the way to Iowa for chicks, when right here in our own territory we can get the finest chicks obtainable?

American Agriculturist investigates and guarantees its advertisements. If an advertiser does not do as he promises, we make good. We suggest that our readers order through the advertising columns of American Agriculturist. Then if the merchandise is not delivered, or if the company does not live up to its guarantee, we see that a satisfactory adjustment is made.

"61½ Bu. MORE POTATOES PER ACRE ...at NO Additional Fertilizer Cost!"

Says IRVING N. HOPKINS, of Pittsford, N. Y.

IRVING N. HOPKINS, of Pittsford, N. Y.

RENOVATE PASTURES — IT PAYS!

"21 Days' Increased Milk Production Paid Fertilizer Cost—Good Net Profit Besides"

If you have a good pasture, keep the clovers coming by top-dressing NOW with 18% NORMAL Superphosphate or AGRICO PHOSPHATE & POTASH. Or, if your pasture is badly run down, bring it back to top-profit production by renovation. Here's how well it pays:

"In August 1948 I plowed under 5 acres of old blue-grass sod which contained no legumes, and applied 800 lbs. of AGRICO PHOSPHATE & POTASH and a ton of limestone per acre," writes Walter J. Elston, of Shady Side Dairy Farm, Dallas, Pa. "I seeded a grass-legume mixture, with wheat as a nurse crop. That winter I applied a light coating of manure."

"In Spring 1949 I put the first cutting in the silo. The yield was very heavy—at least 12 tons per acre of high quality legume-grass silage."

"In early Summer I made hay out of the second cutting, which gave me about 1½ tons per acre. In August, when growth was about 8-10 inches tall, I pastured 40 milkers for an hour a day for 21 days."

"The high-protein content of the legume-grass pasture gave me an extra can of milk per day, or 21 EXTRA cans for the 21 days, worth \$84. EXTRA. The 7¼ tons of hay I harvested is worth \$225. I also got 60 tons of silage."

"The extra milk from pasturing the field for only 21 days repaid my \$76.50 fertilizer investment, and that doesn't count all of the good quality hay and silage I obtained, nor the first-class pasture I now have for future years."

"Yes, renovation pays big dividends!"

WALTER J. ELSTON
Dallas, Pa.

"WE DON'T believe in doing things by habit and find that it pays to be on the lookout for sound ideas to improve our crop production," writes Irving N. Hopkins, of Pittsford, N.Y., one of the best-known farmers in that part of the State. "That is why, for the past 20 years, we have been using AGRICO Fertilizers and the free Soil Service provided by the A.A.C. Co. This has been an important and consistent factor in the very satisfactory yields and quality we have had."

"The soil analysis work you do for us enables us to anticipate changing soil conditions and maintain and improve our crop yields. We can't afford to take chances, because our average annual operation includes 200 acres of potatoes, all certified, as well as 180 acres of certified wheat, certified barley and oats, and foundation hybrid corn."

"61½ Bu. MORE Potatoes per Acre"

"Five years ago, soil analysis showed phosphorus deficiency, so we made a number of field tests, based on your Soil Service's recommendations. Where we plowed down 18% NORMAL Superphosphate, 1000 lbs. per acre, and banded AGRICO FOR POTATOES, 1500 lbs. per acre, at planting time, we got 61½ bu. MORE potatoes than we got where we used 2000 lbs. of Agrico per acre, with no 18% NORMAL—a good extra yield at just about the same total fertilizer cost."

"We repeated these tests on 9 other farms, with similar results, and now use 18% NORMAL and Agrico regularly."

"We have no livestock and hence no manure. But by top-dressing clover seedings with 18% NORMAL Superphosphate, 600 to 800 lbs. per acre, in the Fall, we get plenty of green manure to turn under and improve the yield of the following crops."

"We recommend Agrico Fertilizers, 18% NORMAL Superphosphate and your Soil Service as a money-making combination for the farmer."

Let A. A. C. Soil Service Help

This year it's specially important to get top yields from every acre you plant. Let Agrico help—those extra yields will come in handy in offsetting lower crop prices. See your nearby Agrico Dealer and get your Spring requirements of Agrico and 18% NORMAL—"it'll pay you well!" And keep our free Soil Service in mind—ask your Agrico Dealer, or write direct to us.

"527 Bu. POTATOES PER ACRE ON POOR LAND, IN DRY SEASON!"

Soils are changing all the time—and a deficiency in one or another plant food may develop without a farmer knowing about it—until the crop tells him so. It pays to KNOW—IN TIME. That's where A.A.C. Soil Service can be a big help. As Warren J. Topping, of Sagaponack, L. I., says:

"In Spring 1947 I planted Green Mountains in a rented field. One section of the field did not do as well as the rest of the field. So I asked your A.A.C. Soil Service to test the soil in three sections of this field."

W. J. TOPPING, Sr.
Sagaponack, L. I.

"From the soil report, we found Section #1 showed a fairly well-balanced test, but slightly low in calcium and magnesium. Section #2 was low in calcium, magnesium and phosphate. Section #3, where the potatoes did not do as good as in Sections 1 and 2, showed a serious phosphorus deficiency."

"I followed through with your soil report recommendations, with good results. In Spring 1948, I planted Green Mountains on Sections 1 and 2 and rested Section 3."

"On Sections 1 and 2, I applied AGRICO FOR POTATOES 4-12-8 alongside two other fertilizers, one a 4-8-8 analysis, the other a 5-10-10. All conditions were alike—same seed, planted same day, fertilizers applied at same rate per acre."

"When the potatoes were dug, I found that Agrico had produced 47 bu. MORE per acre than the other 4-8-8, and 36 bu. MORE per acre than the other 5-10-10 fertilizer! The quality was better with Agrico, too."

"On Section 3, I allowed the rye cover crop to mature, combining for grain, and plowed down the straw for humus. That Fall (1948) I sowed another cover crop of rye."

"Last Spring (1949), I plowed the rye under and planted Green Mountains, fertilizing with AGRICO FOR POTATOES, 2500 lbs. per acre."

"On a measured acre of this 'poor' section, I harvested 527 BU. OF FINE QUALITY POTATOES, without irrigation, and as you well know, 1949 was a dry season."

"I attribute this excellent result to a better knowledge of my soil conditions, thanks to your Soil Service and to good seed and Agrico Fertilizer."

Remember, There's an AGRICO for Each Crop — Great Crop-Producers, ALL!

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

Better Health for Consumers

More Money for You!

B ORDERING this page you will find illustrated 47 quart bottles of milk, equivalent to 100 pounds. In the center of the page is a sketch of one penny, a coin which many of us feel is close to worthless at the present price level.

Now look at both, from the 47 quarts of milk to the penny, remembering that the penny is the amount that each dairyman is asked to contribute voluntarily toward selling the 47 quarts of milk through "Milk for Health."

If you doubt that advertising affects the purchases which housewives make, just look around and notice the kind of shoes that our wives are wearing. Winter and summer, most women wear shoes which leave both their toes and heels sticking out to the weather. Do you think for a minute they buy such shoes because they need them? Not on your life! They buy them because they want them and somebody had a big hand in convincing them that they wanted that kind of a shoe.

Starting with milk, the kind of a product that everyone needs, it should be much easier to convince the housewife that she not only needs but wants more milk for her family.

How much milk do you suppose the average city person consumes? The best figure we can get is 5/6 of a pint a day. What do you suppose it would mean to dairy farmers in New York State if consumption could be increased just a little bit—say to a full pint per person today instead of 5/6 of a pint? I'll tell you. It would mean the sale of 1,300,000 more pounds of fluid milk in New York City every day in the year. Shifting that much milk from some lower classification into Class 1-A would increase the income of the average dairyman \$1.30 a day, or roughly would add \$62,000 a day to the income of New York State dairymen who ship to New York City.

What reason have we for believing that the program proposed by "Milk for Health" would get consumers to increase consumption by that 1/6 of a pint a day? We have the best evidence in the world.

Similar programs have worked in markets where they have been tried.

Here are the figures showing increased milk consumption between 1940 and 1946 in three markets that had milk promotion programs and three markets without programs. The three markets that had programs were: Connecticut with a 48% increase in consumption; South Jersey, 67%; Pittsburgh, 47%. The three without programs were: New York with 26% increase; North Jersey, 43%; Boston, 31%. The increased production in the three markets with "Milk for Health" programs averaged 21% more than in the three markets that had no program. What better proof could you have that the program we propose will get results?

Naturally, you who are not familiar with it will ask, "What is the 'Milk for Health' program?" First, it is proposed that all dairymen authorize the deduction of 1 cent per cwt. from their milk checks, the money to be used to advertise and publicize milk. Of every 12 pennies that come into the "Milk for Health" office, 5 are turned over to the American Dairy Association of New York to be used in a program of advertising, merchandising, research and public relations, and 7 pennies are turned over to a Producers Dairy Council Committee selected by milk producers and set up around a market where milk is

sold. If dealers in the market will match this money (and they usually do) a dairy council may be organized in the market to carry on an educational program in schools, with

women's organizations, and, with the help of doctors, dentists and nurses, among the general public.

Such a Council is now operating around the Syracuse market, and others are in the process of being formed around Buffalo, Rochester, Binghamton, and the capital district.

The two programs under the direction of the American Dairy Association and the National Dairy Council do not conflict in any way whatsoever. In fact, they supplement each other. The American Dairy Association has long contributed substantial

PRESIDENT A.D.A. OF NEW YORK AND
SECRETARY OF N. Y. STATE GRANGE

G.L.F. Chick Starter

*The Right Feed For The
Best Chicks You Ever Had . . .*

TODAY'S chicks are stronger, healthier and better bred than ever. Northeastern hatcheries are turning out chicks that can grow bigger faster, and that as layers can produce 20 per cent more eggs than the birds of 15 years ago. Breeding does it.

Feed knowledge has advanced right along with breeding. Feed scientists have learned what these chicks need to bring out the growth and vitality that is bred into them. All this knowledge goes into G.L.F. Chick Starter.

Chicks Must Grow Rapidly

Nature intended chickens to develop rapidly in the early weeks of their lives. During this period the average chick has the capacity to grow in weight from 1½ ounces to 1½ pounds or more. To do this, chicks need a high amount of energy. This energy is furnished to the chicks by the combustion of certain feed nutrients during digestion and allows the chicks to make more efficient use of the other feed nutrients.

High Efficiency Starter

The efficiency of G.L.F. Starter Mash makes it possible to produce more pounds of growth per pound of feed used. Here are more reasons why G.L.F. Chick Starter gives outstanding results in growing pullets.

Protein—Tests have established 20 per cent as the right protein level for starting baby chicks. G.L.F. Starter Mash contains

G.L.F. Growing Mash

Raising pullets at low cost is particularly important this year. Feed makes up 50 to 60 per cent of the cost of growing birds. One of the most important ways of cutting feed costs is to change to G.L.F. Growing Mash at eight weeks of age. Lower cost Growing Mash can be fed at this time because growing chicks no longer need the concentrated nutrients they receive in G.L.F. Chick Starter. A complete list of chick needs including grit and litter, feeders, fountains and brooders are now being carried by G.L.F. Service Agencies.

the correct quantity and a very closely watched quality protein for growth insurance.

A.P.F.—G.L.F. Chick Starter contains enough high quality animal protein to supply all the A.P.F. needed in natural form.

Manufacturing—Three G.L.F. Mills strategically located and equipped with up-to-date machinery keep mixing costs low and insure proper distribution of food ingredients. Laboratories manned by nutrition chemists closely guard Chick Starter to see that it comes up to specifications for minerals, vitamins, proteins and fats needed for good chick growth.

Local Service—More than 600 communities in New York, New Jersey and Pennsylvania keep G.L.F. supplies close to the farm. The quick day-to-day movement of Chick Starter from the Mills assures a steady supply of fresh mixed feed.

Cooperative G.L.F. Exchange, Inc.
Terrace Hill, Ithaca, N. Y.

*Start Them
Right With . . .* **G.L.F. Chick Starter**

Van R. Richards of Batavia, New York, breeder of these versatile Quarter Horses, prefers to "break" them himself—and takes four years for the task. Training, he believes, is built on a foundation of trust.

The Quarter Horse Is Coming into His Own

By JEANNE PONTIUS RINDGE

THE Quarter Horse—earliest American horse breed (established 1665)—is coming into his own again. Down East as well as Out West. Van R. Richards of Batavia, N. Y., Quarter Horse breeder and cattleman, foresees a growing demand for the "versatility, gentleness and stamina" of the once-famous short-horse.

The hoofbeats of the cattle herds are pounding Eastward, and with them, he believes, must come the most skilled of all cow-ponies—the Quarter Horse. Furthermore, he says, the Quarter Horse soon will become what he once was—America's most popular riding horse.

"Already Western style of riding is replacing the Eastern style here," Mr. Richards explained from atop Big Red—superb sire of the growing herd on the Richards cattle "ranch", on Route 98, just south of Batavia. "There is more of it every year in the Eastern horse shows." The steady nerve, natural love of cattle, and the short, stocky conformation of the Quarter Horse—permitting quick spurts of speed, rapid turns and stops—win him top honors in roping technique.

He also shines on the short race course, the breeder points out. The Quarter Horse was so named in early colonial Virginia (where he was developed by crossing British mares with wild descendants of the explorer DeSoto's Spanish horses) because of his unusual speed on the quarter mile course—usually the main street of the town. His short powerful frame made him a useful work horse as well.

After the excitement of a race, even

a stallion such as Big Red will stand calmly while children swarm over him. Show over, he cheerfully will go home to work behind a plow, cutting out cattle, or as a safe-spirited yet untemperamental—family mount.

The American Quarter Horse became an established breed prior to the thoroughbred, and, according to Bruce's American Studbook, contributed to the establishment of the great race horse.

When the longer race course became popular along the seaboard, the Quarter Horse, hitched to the covered wagon, opened up the West. His versatility found its best expression in the cattlelands of the Southwest.

In the last century, the Quarter Horse almost was lost as a distinct breed. Now, newly appreciated, his breeding is actively promoted by the recently organized American Quarter Horse Association.

His most prepotent characteristics, Mr. Richards explains, are "small alert ears; a well-developed neck; sloping shoulders; short, deep barrel; a great heart girth; heavy muscles in thigh and forearm; legs not too long, and firmly jointed with the knee and pastern close."

Mr. Richards' herd is small but of excellent stock. Now he only has a few colts for sale. He prefers to "break" them himself—a four-year task. "Training is no longer a matter of riding a horse until it is broken," Mr. Richards believes, "it must be built upon a foundation of trust."

During the first year, he approaches his colts casually, touching them briefly. They will be saddled several times the second year and ridden the third. They then learn to start, stop, stand, back and ground tie—also the gaits. The fox or jog-trot and the lope are the most popular range gaits.

Mr. Richards believes that "the more good reasons you give a horse for doing your bidding, the easier he is to train" (such as neck-reining at a fence). One of the most difficult feats for both cow-pony and rider is the sliding stop—necessary for good roping. "The horse must be cued while all four feet are in mid-air," the trainer says, "so that he throws his weight on his hind legs as they hit the ground. This brings him to a sudden powerful stop in the midst of a fast run, enabling him to withstand a heavy weight at the other end of the thrown rope."

After four years of "easy does it", Mr. Richards' handsome horses are ready for the horse show, the range, the pleasure saddle—and are adept at all three.

For rugged farm work and bigger crop profits

SPRING IS A BUSY TIME ON THE FARM . . . plowing, harrowing, planting . . . lots of heavy work for your farm machinery. **TAKE CARE** of that important machinery and equipment with dependable ESSO lubricants and fuels . . . keep your tractor, truck, and family car in tip-top operating condition during the busy spring work season. FEED PRICE SUPPORTS UNFAIR

THE FARM BUREAUS of all the northeastern states, Allan B. Kline, President of the American Farm Bureau Federation, James A. McConnell, General Manager of the G.L.F., and others have just made an all-out appeal to Congress to help dairymen, poultrymen and other livestock feeders out of the ruinous squeeze caused by the government's too high support price on grain.

In a strong telegram addressed to many members of Congress, 40 northeastern state farm bureau presidents and secretaries condemned as uneconomic and iniquitous the provisions of the agricultural Act of 1949 which sets a rigid 90% of parity support for the principal feed grains. They charged that feed prices are being held at artificially rigid levels with support standards which operate on one level for grains and another for animal products.

In a similar telegram addressed to members of Congress, McConnell said:

"The position of dairymen, poultrymen and other northeastern farmers is rapidly deteriorating under the present price squeeze. Egg prices now scarcely cover the cost of feed alone, and hens are almost unsalable. Corn and other feed grains are not moving freely into the market because the government program not only takes vast quantities out of circulation but makes holders of grain unwilling to sell except at the unrealistic support price. During the past year the price New York farmers received for milk has dropped 1/5th, eggs 1/3rd. Corn, the principal raw material for making milk and eggs, has declined only 8%, held up by a 90% parity price floor."

Some senators and representatives made a fight to get Congress to relieve this situation, but other members of Congress from the Northeast and from the Central West continued to support the unfair and uneconomic 90% of parity price for grains because they think it means votes, even when the farmers' own organizations, state and national, are opposed to such high price support prices. Therefore, so far this appeal has been in vain, because too many politicians are more interested in votes than they are in agriculture or the country's welfare.

This and other similar situations will exist until you feel the bite enough to let your representatives know how you feel.

MAPLE SAP STORIES

WE MADE great quantities of sirup on the home farm and so always at maple sap time I get spring fever. Probably I would think it hard work now, but to a boy it was fun because it was the first spring job. There were always the "sugaring-off" parties, too, where the sirup was boiled to just the right consistency and spread on top of pans of snow to make the most delicious candy you ever ate.

Although you probably won't admit it, I'll bet many of you old-timers have stolen eggs from your mother's pantry and boiled them in the big sap pans when you had to sit up and boil sap all night. Usually the eggs boiled to pieces and were lost, but when we could find one I think that egg tasted the best of any I ever ate before or since.

The other day someone was telling a true story about a green farmer from the city who started his spring operations with great enthusiasm by tapping all the trees in his woods—maple, beech, birch, and even some of the evergreens. Someone else then came up with a story about riding with someone from New York City during maple sap time. After seeing the sap pails hanging on the maple trees, this New York City man remarked:

"Look at that! Now you tell me why maple sirup should cost so much. All a farmer has to do is to drive a nail into the tree, hang a bucket on it, and then pour the sirup from the bucket into a gallon can!"

Well, sirup isn't made quite that easy, but to me it is still tops as a tasty food. It's good for us, too, at this time of year, for I think there is something in the belief of an old farmer neighbor of my boyhood days, who claimed that maple sirup was the best kind of spring tonic. Three times a day he piled

By E. R. Eastman

his plate full of potatoes, beans, cabbage, meat, etc., and then poured great quantities of new maple sirup over the whole mess.

WHY HE MADE MONEY

MY FRIEND, Professor L. M. Hurd of Cornell University, reports that Francis Snow, a poultryman of Onondaga County, is able to do all of the chores in taking care of his flock of 1,300 White Leghorns, including packing the eggs, in just 1½ hours daily. Moreover, Francis got a 12-month average of 229 eggs per hen.

Francis got his costs down by using every possible labor saving device and by growing most of his grain. As a result, he and hundreds of other poultrymen who have used the same efficient methods will still be in business and making at least a small profit when thousands of other poultrymen are driven out.

I always hate to talk to farmers about efficiency, because I think the average efficiency of farmers is above that of many other manufacturers or workers, and also because the average city man is always talking about the inefficiency of farmers. However, we all know that no matter how good we are we can improve, we all realize the necessity of studying and working all the time to do a better job and cut down the costs and such study is especially necessary in a period of declining prices like we have now.

HE WARNED IN TIME

ON MY DESK as I write is a letter from an old friend, a fellow editor, who is just recovering from a bad heart attack. He will never be the same again.

I hate to think of the large number of my friends who within the past ten years have either died from heart trouble or who have only partially recovered. The sad thing about it is that most of these men could be in reasonably good health right now if they had heeded early warnings or remembered their age.

Daily the heart pumps 9 or 10 tons of blood through miles of blood vessels, and it pumps it hard and fast. The heart is the toughest and strongest of all the body organs, and yet it is necessary for it to have a lot of rest, particularly after one is 40. It gets this rest between beats when one is not exercising.

If you are middle-age or over, every time you get mad or become over-excited, every time you run when you should walk, every time you run upstairs, every time you hurry in pitching on a load of hay or manure, and particularly when you get in a hot haymow, you are very likely to strain your heart.

Another old friend writes:

"Since I wrote you last I have had another heart attack—the handwriting on the wall. I am now forced to sit and do nothing. All of our lives we yearn to do just that, but when we have to do it, that is indeed a horse of another color."

Heart attacks disable or kill—one is almost as bad as the other. Be warned in time. Give your heart plenty of chance to rest.

MOST OF US ARE POOR EATERS

SURPLUS has always been the farmer's bugaboo. For a comparatively small amount of it ruins the price for all the remainder of the product. So, all kinds of schemes to solve the surplus problem have been tried. None of them has worked, and some of them, like those the government is using now, have done far more harm than good.

The problem has always been attacked wrong-end-to. Ed Babcock has time and again pointed out the right remedy when he says that the American people should be taught to eat a better diet. Following up Ed's idea, Dr. Karl D. Butler, Farm Counselor to the Avco Manufacturing Corporation, says that in America today we have 28½ million people with good diets—"better eaters" he calls them—and 121½ million "poor eaters." It isn't always a matter of the cost of food, either; it's the problem of making the right choice. The best choice, of course, is to eat more animal products—meat, eggs,

and milk products, supplemented with plenty of fruits and vegetables.

Dr. Butler says, "if the 121½ million people who are average or poor eaters would eat the same diet as the 28½ million better eaters, we would need each year:

7¼ billion more pounds of meat

1½ billion more eggs

Almost 2 billion more pints of milk."

To produce these extra high protein foods would take 1,025,000,000 bushels of grain. This would create a shortage equivalent to three times our 1929 surplus. All the surplus would be wiped out and the general health of the American people would be infinitely improved.

The job, therefore, is to get the large majority of people to eat better food. This can be done by using all possible efforts to keep the retail prices within reasonable limits, and by an intense educational campaign to get the facts about food nutrition and health and keep them constantly before the general public.

SHOULD YOU BEAT YOUR WIFE?

WRITING IN THE Saturday Evening Post, Royle Duhanty, an Englishwoman who has become a naturalized American citizen, gives many interesting reasons about why she loves America. But she is quite positive that one of our customs or attitudes here is wrong and that is the habit of the American male of letting women have their own way in all things. Says Mrs. Duhanty:

"Like any woman who was ever born, I want my own way immediately, if not sooner, but I also need to know that any man to whom I am close is potentially able to beat the h--- out of me when I become impossible, and is perfectly willing to do so."

Well, that's the Old World point of view, but ever since I was a boy in this country women have invaded every trade and profession and have made their way even into the male's last retreats, the barber shop and saloon. It is possible that in this evolution or revolution women have gone too far. My own opinion is that in life, in the relationship between the sexes and in marriage there should be a true partnership where each point of view and the rights of each have equal consideration. What do you think?

IT MADE HIM FEEL "SWELL"

F. H. (Stub) DAVIS, one of *American Agriculturist* field representatives writes:

"I just want to tell you about some very nice people who like *American Agriculturist*. I called on a man today who has taken the A.A. for 40 years, reads it from cover to cover, first turns to Eastman's Chestnut, then to the Lazy Farmer, and then to Ed Babcock's page. It was a pleasure to renew his paper.

"Another man said that he is chairman of the county farm bureau and that he reads every copy of the *American Agriculturist*. He has hired help, also, who read the A.A.

"Still another man on whom I called said that he wanted to make sure that his subscription never expired.

"I find many people like this every day. It makes a salesman feel swell to meet them."

Thanks, Stub! It makes an editor feel swell, also, to get such comments—and we receive a lot of them. Moreover, it makes your editors determine to dig in and do a better job for all of our great family of readers.

EASTMAN'S CHESTNUT

JENNIE," called Bill from his chair by the window. "There goes that woman John Harris is so soft on."

Wife Jennie, in the kitchen dropped the plate she was drying, burst through the door, knocking over a lamp, and craned her neck to look out of the window.

"Where? Where?" she panted.

"There!" he answered. "That woman in the gabardine suit, on the corner."

"You idiot!" she hissed. "That's his wife."

"Of course," he agreed, "what did you expect?"

Credit and Economic Review

WHEN PRESIDENT H. B. Munger, head of Cooperative Farm Credit in the Northeast, went to Ithaca to ask the folks at Cornell to put on a credit and economic review for presidents and creditmen of the 28 National Farm Loan Associations and 13 Production Credit Associations of New York State, the professors readily gave their consent on the condition that they would be granted the privilege of asking the creditmen questions about present credit policies and conditions. That assurance was quickly given by Mr. Munger. The result—a lively, stimulating, give and take with about an even split of information between the two groups.

Professors Van B. Hart, M. C. Bond, and L. C. Cunningham, Extension men in Economics, Cornell University, led the discussions at Syracuse with over 100 farmers and farm-minded people in attendance. The future course of farm prices and costs dominated the conference as the price level will have the greatest effect on farmers' well-being and on credit. Prof. Cunningham said the farm price level rate of decline might be arrested during 1950 because of the effect of government price supports. He said, however, that it would be impossible over a longer period of time to keep U. S. prices above world prices and he felt that the support program, barring a war, would collapse.

Prof. Cunningham pointed out that despite government programs, and despite differing conditions, farm prices have always risen during every major conflict in which the United States has engaged and have always dropped sharply following that conflict. There is no reason to believe the future course of prices would be any different.

Prof. Bond reviewed the price support programs over the last 50 years and indicated the net result of all of them was bad.

Charles H. Riley, secretary-treasurer of the Farmers PCA of Syracuse and the Oneida-Madison NFLA, reported that during 1949 and so far during 1950, careful business farmers were cutting down their debts and amount of borrowing from the Production Credit Associations. He said that the average size loan of the Syracuse PCA had declined. He attributed this to good business farmers seeing less income in sight. He said that many younger farmers whose experience covers only the 1940's regard the present high price level as normal and still wish to borrow substantial amounts and in many cases wish to expand on borrowed capital. He indicated this type of operator might run into difficulties and would give the

credit associations their greatest trouble. He felt his associations could best help these men by not lending them money now for capital expansion.

Harry Petzold, Secretary-Treasurer of the National Farm Loan and Production Credit Associations at Ithaca, felt that his associations could go a long way with good farmers with whom they had had a lot of experience. He indicated that if a farmer had not done very well in the past few years, there was little chance for him to be successful the next few unless the previous lack of progress had been caused by something beyond his own control.

The secretaries indicated that the Production Credit Associations would continue to offer adequate credit to good business farmers. National Farm Loan Associations acting as agents for the Federal Land Bank will continue their policy of loaning on normal values. As market values approach normal values, it is expected that the demand for long-term credit might increase.

Dr. Hart summarized the conference. He referred to a study of 14 farms made in Tompkins County in 1907 and repeated every 10 years since. This study revealed a sharp increase in cash needed to operate a farm.

For example, in 1907 a farmer could put up cash operating costs for 12 years, never get a cent back before he would lose an amount equal to his investment in farm and equipment. In 1947, because of the sharp increase in operating costs, he could lose an amount equal to his investment in 2½ years. This shift has made farmers more vulnerable to sharp price changes.

He said a loan made in today's dollars may have to be repaid in more expensive dollars. He urged limiting loans for capital improvements to purposes that will increase the farmer's efficiency rapidly enough so that the loan can be repaid before any rapid price level drops.

Prof. Hart recommended that no loan should be granted to a father-son partnership unless these questions can be answered, "Yes":

Is the business big enough to support two families? Are there separate houses for each family? Is there a definite business arrangement concerning receipts, expenditures, and responsibilities? Is this definite arrangement written down?

Prof. Hart said that it might be that certain farmers will not be able to continue to farm. The time when they should quit should be a subject of earnest consultation between the borrower and lender so that both can come out with the least loss.

The Song of the Lazy Farmer

MIRANDY'S upset 'cause I'm not excited, bothered and red-hot about the fact that spring is near and field work time is almost here. She thinks I should be out right now to put a shine upon the plow; she'd have me work 'til I'm half dead a-pullin' stuff from out the shed to make sure it's in good repair and greased and oiled up ev'rywhere. She worries 'cause the oats ain't fanned and where to sow 'em ain't been planned; apparently she thinks I ought to have my fertilizer bought, and she complains to beat the band 'cause all the seed is not on hand.

I've tried to tell her it's a crime to worry so ahead of time; it don't make sense to jump the gun before the winter is half done. Why, right here in the almanac it says we might as well sit back and take it easy 'cause this spring is going to be late, by jing. It says there'll hardly be a day that's fit to work 'til almost May, there will be more snow this month yet and all of April will be wet. And so,

despite Mirandy's cracks, I guess I might as well relax, because there is a month left yet before I need to get upset.

March Farm Bulletin

This Month:

1. Getting your tractor ready for Spring.
2. Avoiding furrow breaks in rear tractor tires.
3. Easier steering for your tractor.
4. Something new in farm greases.

1. Getting your tractor ready for Spring.

You'll be giving that tractor of yours plenty of hard work this Spring, plowing and discing for hours at a time. You'll want to be sure it's in tip-top shape.

Here's a good way to flush out the winter oil and sludge: 1. Run the motor until warm, then drain. 2. Put in 3 quarts of clean oil and run the engine for 4 minutes. 3. Drain and refill with summer-grade Gulfube Motor Oil.

You can buy Gulfube in the new 5-gallon size now. You get two things for your money that way.

A premium-type oil, refined by Gulf's famous Multi-Sol Process. And a rugged all-metal utility can, a strong one you can bang around plenty. It's a good deal. Use the oil—keep the can!

2. Avoiding furrow breaks in rear tractor tires.

Twelve pounds inflation is sufficient for ordinary field work. But when you're plowing, it's a good idea to add 4 lbs. more air pressure to the furrow wheel. This offsets the extra weight thrown on it by the tilt of the tractor.

Otherwise, the sidewall might buckle in the furrow, eventually breaking the casing cords and shortening the life of the tire.

3. Easier steering for your tractor.

Sometimes good handling of your farm tractor is even more important than good traction. And for easy handling, you can't beat the Gulf Front Tractor Tire.

The raised center rib gives positive steering in soft soil, and the tire won't cut in because of its extra-wide tread.

Double ridges grip the furrow wall when you pull out to turn. Tough Gulf Tractor Tires, front and rear, will help you get more work out of your tractor this Spring.

Reminder: If your cows switch and fuss just when you're trying to milk, Gulf Livestock Spray will get rid of annoying insects in a few seconds.

It's economical, too. Usual price, only \$1.69 a gallon at your Gulf dealer's.

4. Something new in farm greases.

It's the new Gulf All-Purpose Farm Grease. And it does every grease job that comes up; whether it's preventing rust, or lubricating the wa-

ter pump or manure spreader. It has passed every test in the book, including wheel-bearing and water-leaching tests.

Ask your Gulf dealer about this handy new All-Purpose Farm Grease.

GULF

Farm Aids

When **RESULTS** count
plant **FUNK G**
Hybrids

If you measure results on the basis of corn in the crib or silage in the silo, then you'll be interested in FUNK G HYBRIDS.

These amazing FUNK G HYBRIDS are dependable producers of bigger yields—better corn, year after year. They are the result of a careful and painstaking breeding program. They have "bred-in" characteristics that produce outstanding results—even when climate or other conditions may be unfavorable.

Cold, windstorms, drought, summer's intense heat, and early cold spells have little effect on FUNK G HYBRIDS. They're bred to resist the elements. Bred to have large, deep roots for better standability. Bred to grow fast. Bred to resist disease and insects. Bred to produce more and heavier silage. Bred for fine uniform ears that are easy to husk. Bred for greater yield.

Don't gamble with success this year. Make sure by planting FUNK G HYBRIDS. There are special varieties like G-6 and G-10 for high altitude areas where the growing season is short. Also new varieties (G-98 and G-99) which have the big-ear characteristics of Lancaster County Sure-Crop plus standability, disease and insect resistance and other "bred-in" characteristics you find in all FUNK G HYBRIDS.

There are varieties for both husking and silage. All have been field tested and proved right for your local soil and climate conditions. For colorful FREE booklet telling all about our new 5-Star varieties mail the coupon below. There's no obligation.

BIRDSFOOT TREFOIL

Benefactor or a "Flash in the Pan"?

By T. E. MILLIMAN

IN the summer of 1937, I saw birdsfoot trefoil on some hill farms in Albany County, N. Y., whose assessed valuation was very low. I saw hay yields of better than two tons to the acre where no lime and no fertilizer had been applied and where even the encroachment of birdsfoot trefoil upon the land could not be traced back to its source. The farmers who grew it told me then of its palatability to cattle as pasture and as hay. One man said his cattle liked it better than alfalfa.

There in Albany County I was looking at unplanned legume stands equal to those of alfalfa on \$100 an acre land elsewhere. I'll never forget it. Later I followed it from afar. It wasn't until 1949 that I could pick up the trail and closely examine the developments of twelve years.

Let's Put the Bad Side First

A survey was run among farmers in the fall of 1949. Some 525 replied. From these replies and from other contacts and observations the following seemed to be the principal limitations of birdsfoot trefoil:

1. It is unreliable when added to an existing pasture.
2. Sometimes it is choked out when seeded on harrowed land after plowing under sod, especially on strong land.
3. It is sometimes difficult to establish in any case and is always of low yield the first year.
4. In most situations it refuses to compete with other legumes seeded at the same time.
5. It lodges badly when on fairly good fertilized soil.
6. Being a slow comer, it is unprofitable as a hay plant in short rotations.
7. It starts late each spring, and when grazed or cut it comes back less rapidly than ladino or alfalfa.
8. Difficulty of harvesting makes for a high seed cost.

Now for the Good Side

From the questionnaires sent in by the 525 farmers, from Cornell authorities, and from personal observation throughout New York and Northern Pennsylvania, the following turns up as the majority opinion on birdsfoot trefoil:

1. It does establish itself rather generally on well fitted land following a hoed crop when seeded all by itself or with timothy only.
2. Although responding to good treatment it will survive with less lime, superphosphate and potash than required by alfalfa.
3. It is a desirable pasture because of good mid-summer growth, with no apparent fear of cattle bloat.
4. It stays longer than does alfalfa, red or ladino clover.
5. It will take a wider range of soils, tolerate "wet feet" to a greater degree, and is more drought resistant than clovers.
6. It will provide 1½ to 2½ or more tons of good high protein hay annually and will maintain a good percentage of legume in association with timothy or grasses which volunteer.
7. It comes into the hay stage later in the season than do clover and alfalfa, thus extending the period for making good hay.
8. Once established, it will stay on hill-sides where other tall legumes cannot be made to stick.

Most farmers who have tried birdsfoot trefoil are going to keep on by enlarging acreage. They recognize it

as the first promising legume for hard-to-plow hill lands. The demand for seed has for some years been in excess of supply. In 1950 seed is likely to be scarcer and higher than ever before. Success has been had with the more erect-growing European type of birdsfoot trefoil in New York State and Northern Pennsylvania. The European seed is cheaper. The European type grows higher, remains more erect, and recovers more rapidly after cutting or grazing. It also comes on earlier in the spring.

Cornell tests under Dr. H. A. MacDonald have shown that the European birdsfoot trefoil will survive mild winters such as we have had for a number of years. Some uncertainty exists about the ability of the European type to withstand our worst winters on wind-blown slopes. Those who want to try birdsfoot and can't get either kind of seed have the opportunity in 1950 to grow a row crop and thus get the land clean for a good seeding of birdsfoot in 1951. It is considered best when seeding with oats to graze off the oats or cut them for hay. In all cases, birdsfoot trefoil must have its own special type of seed inoculation. Do not top dress it with manure for several years after seeding, but give it lime, superphosphate and potash.

What of its Future?

I don't know. Being an alfalfa grower on limestone land which cost \$100 an acre in 1925, I've found out in Monroe County, N. Y., and in observation generally, that alfalfa is ideally suited to very few locations. It is never a permanent resident; always a visitor and a snooty one at that. Probably because of diseases and insects, alfalfa won't even stay on the same land as long as it did 15 and 25 years ago.

Men are buying hilltops in New York State at from \$1 to \$10 per acre and planting birdsfoot for seed raising. They also stock up with cattle and/or sheep. I've seen stands on such land 12 and 13 years old and still carrying 40% to 50% legume. Although sincere in stating that I do not know the future of birdsfoot trefoil, I must add something. If I owned a farm with a good deal of hard-to-plow slope from which I needed good yields of high legume pasture or hay, I would try birdsfoot trefoil at any cost of energy and money within my means. My first seeding on shaly, drouthy soil alternating with wet spots produced a remarkably good stand in the unfavorable year of 1949. Now I am looking at a mean little slope where alfalfa never stays, where ladino is smothered by grasses and we're always reluctant to plow. That one is slated for birdsfoot trefoil.

President H. B. Munger, of Springfield Farm Credit Administration, has said, " - - - too little consideration has been given to some three to four million acres of land in New York that is classified as permanent pasture. Very little feed for our dairy cattle is being produced on all these acres and I, personally, have felt that birdsfoot trefoil may be an important part of the answer to getting a lot of good dairy feed from these unimproved permanent pasture areas."

If it succeeds generally, I believe birdsfoot trefoil will occupy a large place in reducing the cost of raising cattle and producing milk in the Northeast. If it turns out to be merely so-so, it will still be worth the effort. Relatively few cases of failure have been reported or observed. Protein in the form of forage is our great Northeastern need.

Proposes 6-Point Program to Give Fair Farm Prices

NATIONAL Grange Master Albert S. Goss has proposed a six-point farm program designed to give farmers a fair price in the market place and minimize the necessity of government aids and controls.

Goss, participating in the recent Minneapolis Farm Forum with Secretary of Agriculture Charles Brannan and other farm organization leaders, withheld approval of both the present farm law and the Brannan program, declaring that the Grange did "not approve any program which would make it necessary for the farmer to look to the government for his livelihood."

"Most people seem to think we should be either in one camp or the other," Goss said. "We have never been in either camp and have continually pointed out that there is a much better way."

The farm problem, Goss said, cannot be treated as a separate and independent problem. Rather, it must be considered as only a part of a very serious economic problem with which the nation is confronted. The problem of industrial employment looms far more ominously than the farm problem, Goss declared.

He asserted that if the problem of high industrial employment and healthy income can be solved the farm problem will become much more simple. With a prosperous industry and an upgrading of our diet, farm production can be adjusted to our needs and the problem of assuring plenty without destructive surpluses can be met.

Wants Farm Commission

As the first step in meeting the multiplicity of farm problems, Goss proposed the creation of a 12-man bipartisan Federal Farm Commission to act in an advisory capacity to the Secretary of Agriculture. "A major duty of the Commission," he said, "would be to keep a continuing inventory of supply and prospective outlets for farm products; to work with producer, processor, and distributing groups in pushing items in surplus supply, and assist in adjusting supply to prospective demand."

Point two in the program advocated by Goss, is the broadening of the Marketing Agreements Act to include all commodities which can be used for diversion of surpluses to secondary uses such as milk into butter, cheese and skimmed milk.

Point three in the program is use of a two-or multiple-price system to syphon off surpluses into industrial uses and exports, using some form of debenture, equalization fee, certificate plan or other measures.

Point four advocates price supports only when the three self-help proposals do not meet the situation. The Grange prefers flexible price supports over fixed supports.

Point five proposes use of marketing controls and acreage allotments in extreme cases where it is necessary to make rapid, substantial readjustments in production. The Grange gives preference to marketing controls in such an event.

The National Grange puts production payments in sixth position in their proposed farm program, stating that these payments should only be made as a last resort.

Irrigation News

FROM ALUMINUM COMPANY OF AMERICA

VOL. 1 NO. 1

NORTHERN EDITION • MARCH, 1950

Illinois Farmer's boosted yield of Top-grade Tomatoes clinches Portable Irrigation System—in one year!

Oswego, Ill. . . . Jacob Strukel increased his tomato yield from 9 to 16 tons per acre by once-a-week irrigation during the hot summer months. This top yield news was terrific, but the canning company buyers added another clincher. Strukel stated that the buyers agreed "that we had the best grade of tomatoes that were purchased from this area this year."

Irrigating when the plants needed water pushed growing speed—climaxing in an earlier harvest. Strukel's increased per-acre yield "very nearly paid for the equipment this first year," and he adds, "I plan to expand my irrigated acres next year to three times the amount that I irrigated this year."

An interesting note on summer irrigation came when representatives from the canning company visited the Strukel farm. The ground temperature was 112 degrees when the owner turned on the sprinklers. "As was indicated by my yield, the only effect of irrigating in the

hot daylight hours," he said, "was increased quality and quantity."

Strukel's portable aluminum system was purchased from the John Effa Irrigation Company of Chicago.

IRRIGATION EXPERTS READY TO HELP YOU

Your portable sprinkler system will cost less and do a better job if you get the advice of qualified irrigation specialists right at the start. Many factors must be considered—crops, soil conditions, topography, availability of water, and so on. You can get reliable information from your county agent, your state agricultural college, or from recognized irrigation equipment suppliers.

College Report Recommends Aluminum

For over three years, research chemists at State College of Washington, Pullman, Wash., have conducted experiments in the laboratory and in the field to check the relative corrosion resistance of various metals used for irrigation pipe. Their report, Bulletin 201, concludes: "The comparative strength and lightness of aluminum and its high resistance to general corrosion make it a most suitable material for use in portable sprinkler irrigation systems."

PICK THE PIPE THAT'S PORTABLE!

LIGHTWEIGHT, LONG-LASTING

ALCOA

ALUMINUM IRRIGATION PIPE

A FARMER ASKS:

Can I afford a Sprinkler System?

"Portable sprinkler irrigation looks fine", you say, "but can the average farmer afford it?" The answer is simple. In many cases, a sprinkler system pays for itself the first season. In times of drought, it can save crops which might be lost. It can hasten your harvest, enable you to sell when prices are high. It improves yield and product quality. Small wonder so many farmers say, "I couldn't afford *not* to have sprinkler irrigation!"

"SPRINKLINGS"

A 20-foot length of 3-inch Alcoa Aluminum irrigation pipe weighs only 11 pounds, 2 ounces—as against 32 pounds for steel.

* * *

Alcoa Aluminum irrigation pipe requires no painting or other protection from the weather.

* * *

By using portable sprinkler irrigation, a Michigan farmer increased his potato yield from 175 to 400 bushels, and his per cent of U.S. No. 1's from 60 to 95%.

* * *

A new tractor-move system makes it easy to shift an entire line of aluminum sprinkler equipment from one side of a field to the other.

* * *

The marking "63S-T6" on Alcoa irrigation pipe identifies a special aluminum alloy, with ample toughness to take hard knocks.

Fertilizing Through Irrigation

You can save time and money by fertilizing and irrigating at the same time with a portable sprinkler system. Liquid fertilizer, containing all the essential elements, is mixed with the irrigation water through a connection at the suction side of the pump. This practice has produced excellent results on crops such as cabbage, cucumbers, greens, sweet corn and fruits.

Free Booklet Answers Many Questions About Irrigation

Would you like to know more about portable sprinkler irrigation systems? How they are making farms more profitable? What equipment is needed? How to install a system? How much a system costs? Something about sources of water?

These and many other questions are answered in this 32-page book, "Portable Sprinkler Pipelines to Profit". It's free . . . mail the coupon today.

**A GENUINE
YELLOW DEVIL
SPRAYER**

only
\$130.00*

Model 31

**WITH EVERY FEATURE FARMERS FIND ESSENTIAL
FOR SAFE, SURE, HIGH-SPEED SPRAYING**

DON'T buy any sprayer until you see the new Model 31 Yellow Devil 4-Row Economy Sprayer. Now you can spray small acreage at **low acreage cost.**

See how Model 31, like every Yellow Devil, is **built to last.** See the sound engineering and rugged construction that will make it stand the jolts and strains of rough, fast farm spraying for years to come.

And you'll find on Model 31 all those features that farmers say a sprayer must have to do a good job:

* FOB Cleveland, Ohio

**BE SURE YOUR NEW SPRAYER
HAS ALL THESE ESSENTIALS**

Every Yellow Devil has:

BRASS BOOM INNER TUBE for freedom from corrosion and clogging.

BRONZE GEAR PUMP is non-corrosive. **UNI-FAN NOZZLES** put the spray where you want it, not into drift-fog.

COLLISION HINGES let booms swing both ways for full protection.

3-WAY FILTRATION keeps you spraying.

ADJUSTABLE BOOM HEIGHT & ANGLE.

CHEMI-RESIST HOSES stand chemicals.

Spring is Here FOR THE FRUIT GROWER

By D. M. DALRYMPLE

IN BETWEEN good pruning days we have been engaged in that interesting indoor pastime of taking apart the spray rigs, tractors and several small engines and water pumps that we use in spraying. It is interesting and easy to take these machines apart but they go together a bit slower. We try to get all the machinery in working order and painted before spring. This work is done in our partitioned-off cement floor building, once a horse barn but now a cheap farm shop. Our only new tools this year are a Jesse Clark pruning platform and a homemade steel brush pusher.

The high cost of labor has forced many of us to invest heavily in labor-saving tools and many growers fix their own tools with a little help from the neighborhood welder and some specialists. It always bothers me to pay a highly skilled mechanic for the slow manual labor needed in taking machinery apart and putting it together again. Then too, they know no more about the new spray machinery than I do and I figure they are learning about it on my time.

Another advantage in fixing our own tools is that we find out how they are built and treat them more carefully the next season, especially as far as grease and oil are concerned.

We have found that a battery charger is a good investment. It is amazing how many batteries you can find around the modern farm that need recharging through the winter. They freeze up easily and go to pieces fast if they are not charged.

An increasing number of fruit farm tools are being made of steel which is subject to plenty of corrosion as it comes in contact with spray materials. This is not quite so bad as it used to be, but it is still serious enough. Spray rigs that ought to last 10 or 15 years are beginning to rust out in 4 or 5. The use of the new rust-preventing paints is advisable while the tools are down.

Growers are still buying good, new spray equipment. This was pretty clearly shown at the Trade Shows of the New York State Horticultural Society winter meetings.

The new ways of spraying, using the higher concentrations and less water, attracted much interest indicating that growers realize that their water bill, both for getting it and putting it on, is a very important item in spray costs. Anything that reduces the amount of water used is going to be popular. Whether the new "mistlers" and concentrate rigs will really handle the problem was not too clearly demonstrated this winter. Specialists have a lot of ideas; some of them still have to stand the test of bad disease years.

Perhaps the answer to some of the problems on high-capacity, high-priced equipment is for more growers to get

together and use the same equipment. From my former experience on the farm, borrowing is a good way to make enemies of good friends, but it does seem a shame to have these good rigs idle all winter and half the summer when they might be used two-thirds of the summer. Probably the answer is more custom work.

New types of pumps are showing great promise in increased efficiency and less upkeep. However, high pressure is always expensive and so is movement of large volumes of air.

One thing you do not want to do in the farm shop this winter is to put too much power on your old high-pressure rig. It is all right to have the power but do not apply it unless you need it. Overworking the old rig may only wear it out so fast that you do not gain anything.

Having a lot of spray rig and very little water is also proving to be expensive for many growers. A couple hundred dollars spent on a water hole and a centrifugal pump may save hours of refilling. It does not do much good to apply a tank of spray material in 8 minutes if it takes 10 minutes to fill the tank.

What materials to buy. New York County Agents are now advising growers what the recommendations are going to be this spring and summer. Growers have a wider choice of materials than ever before. Many of you are now debating on what dormant sprays you are going to apply. Apparently the new DiNitros like DN289 and Elgetol 318 did not control European Red Mite as long as did the delayed dormant application of Superior oils. However, as a grower, I am still going to use DN289 and Elgetol, one application, which knocks down the egg population pretty well, along the lakeshore at least, and usually cuts off one complete spray. I may, on some of the Red Mite susceptible varieties, use some Superior lubricating oil in addition to the DN's. Those who have had serious trouble with Red Mite had better stick to the two applications—that is Elgetol or DN at dormant for Bud Moth and Rosy Aphis, and oil at delayed dormant for Red Mite.

Dormant Sprays. Some people are now beginning to question the need for dormant sprays with new materials like Parathion coming into the picture. I heard quite a bit of talk about this in Michigan. Personally, I feel that we are not ready for any such drastic step in New York State, with European Red Mite, Rosy Aphis, fruit tree Leaf Roller and Bud Moth still potentially very dangerous. Complete losses of fruit from severe attacks of Bud Moth and Leaf Roller are still vivid in my memory. I certainly would not trust control of Rosy Aphis to any new system

(Continued on Page 22)

RED-BANDED LEAF ROLLER in the enlarged picture at left, is shown in its mature caterpillar stage, feeding on the surface of an apple. It is so secretive in its attack, hiding under leaves and between close-growing apples, that the grower often doesn't know the full extent of damage until he picks and finds something like the injury illustrated in the picture at right. Dan Dalrymple, in the accompanying story says best control is obtained with DDD and Parathion.

"THE APPLE — Is Still King of Fruits"

By Ed W. Mitchell

SOMEHOW I got to thinking of one of Ed Eastman's old stories. The strong-man at the fair bent spikes and tore phone books with his hands, and then squeezed a lemon and offered \$5.00 to anyone in the admiring crowd who could squeeze another drop from it. A weazened little shrimp of a man in the back row stepped up and squeezed out a whole spoonful and the amazed strong-man inquired his profession, assuming it must have something to do with his phenomenal grip. "Cashier at the Farmers' Bank", was the modest reply.

This old story may have a modern and personal application for fruit growers this spring, for they have just been subjected to that old, old squeeze play—high production costs and a big crop with consequent low prices. It is nothing new, and most fruit growers and farmers have had this experience before, but conditions have changed in many ways that make it seem different.

Times Change

Years ago, production money came from credits on the dealer's books, notes at bank, and what little cash the farmer might have on hand. The first of these, credit on dealers or Co-op books has about dried up; the second is in a state of delicate balance that may dip down this year to the vanishing point for apple growers; and the third did not even appear this year to get an opportunity to vanish. What many apple growers will use for money this year is still a mystery, and we may be swapping in our fishhooks and marbles to get a little sulfur and lead.

This much seems obvious: Many orchards will be abandoned or pulled, or at least neglected so they will bear no good fruit. The number of apple trees will be reduced again, and the expansion of production from the remainder can increase only gradually and certainly will not repeat the bumper crop of this year. This should, we hope, promise better prices for the next crop and perhaps adjust supply to demand so fairly good prices may obtain for some years to come if supply and demand are the principal factors governing the price of apples.

Promotion Lacking

However, the number of apple trees and production of apples have not kept up with either increase of population or expansion of production of other crops, and it may be that lack of adequate advertising and poor distribution and selling methods are more to blame for low apple returns than an over-supply. It may very well be that prices of apples at retail have become so high that we have priced ourselves out of the market.

I find the apples I sold for three cents a pound retailing in nearby city stores for ten and twelve cents, and I think that is more than the average housewife can afford or is willing to spend for any great amount of apples. Then again, the grocer prefers to stock a non-perishable product because loss from waste cuts into profits. The modern housewife seems to prefer processed and packaged foods that she can store indefinitely in a small space and cook by just opening a can and warming the contents. We may have to process more and more of the crop to get it consumed.

We might, just for the fun of it, launch a campaign to restore the good old practices of drinking more hard cider and apple-jack and having apple pie for breakfast and just before go-

ing to bed. We would not lack for willing demonstrators; it suggests a pleasant and profitable occupation for old fruit growers in their declining years.

One trouble with the apple business is that most fruit growers are horticulturists or mechanics at heart and like to make things grow or keep machinery running, and they do not like the mercenary part of selling and, consequently, do not do it well.

In theory, it might seem as though

apple growers might band together to hire this service performed for them by some competent person or agency, but it has not become a general practice. Only enough have done it to indicate it can be done. On the other hand, perhaps the gradual changes forced by changing conditions and the slow molding of many minds may be more wholesome for the apple industry, or for any other industry, than any plan that is devised by some genius and put into operation under pressure, whether from economic pressure or government or any other source.

Fortunately, apples are classed as a semi-luxury; they are not apt to suffer the violent fluctuations that apply to potatoes or food in the real luxury class; neither are they so apt to fall

under political control. Just as our New England states seem to be the last stand of rugged individualism, so maybe the apple growers may be the last stand for an independent agriculture. They seem to be a rugged lot and gifted at surviving.

There is comfort in the thought, too, that the apple has been the king of fruits since Adam roamed the garden, and sufficient amounts of this fruit are still consumed to warrant some consumption will continue for a long time to come. The growing of an orchard and production of a crop involve more than a passing fancy, and those that can stick may find, and I hope they will, the growing of apples as pleasant and more profitable than in the past. Time will tell.

Raise Row Crop Profits with an OLIVER Row Crop!

An Oliver Row Crop tractor is your perfect choice for planting and caring for a wide variety of row crops. Its six forward speeds give you the proper working pace for any practice. Conveniently grouped controls and a revolutionary rubber torsion spring seat provide unequalled comfort and handling ease . . . enable you to stay on the job longer and accomplish more.

See your Oliver dealer before spring field work begins. From the full line of 31 Oliver Row Crop matched implements and attachments, you can select the mounted equipment that meets your exact needs. What's more, these mounted tools are basically interchangeable among the Oliver "66", "77" and "88" models. The Oliver Corporation, 400 West Madison Street, Chicago 6, Illinois.

A parallelogram coupling keeps Oliver tractor mounted tilling, planting and cultivating tools on an even keel. These diagrams show how the gangs stay level and are permitted to float independently.

Dry Bean Growers Plan for 1950

By E. V. Hardenburg

DURING late January and early February, bean growers held well attended meetings in Genesee, Onondaga and Monroe Counties in western New York. Attendance at Farm Bureau meetings is sometimes thought to be a pretty good barometer of probable changes in acreage planted and grower practices. Good interest at these meetings, therefore, may indicate that at least there will be no marked decrease in acreage in western New York in 1950. Actual intentions to plant are usually issued by the U. S. Department of Agriculture about March 1 and reach the grower about March 20.

In making plans, bean growers are influenced by a number of factors, among which are acreage prospects, government price supports, seed and fertilizer costs, prices received for last year's crop, and cost of growing beans in comparison with other cash crops. These are the factors mostly discussed at bean meetings and elsewhere at this time of year. We present here very briefly some of the information available in reference to situations and prospects facing the dry bean industry.

Price Support for 1950

As of January 16, the U. S. Department of Agriculture announced that the 1950 crop of dry beans will be supported at 75 per cent parity index, but only for growers who comply with their acreage allotments. This differs from 1949 in that the support was at 80 per cent of parity and there were no acreage allotments. Acreage allotments will be based on farm history of bean acreage for recent years and will be announced through local county P.M.A. offices as soon as they can be calculated.

Of the varieties grown widely in New York and other eastern states, only red kidney and pea beans will be eligible to price support. The 1950 crop of U. S. No. 2 grade or better will be eligible to support under levels to average \$6.30 per hundredweight thrasher-run basis. This level as announced is said to be 25 cents the hundredweight below the support price of 1949.

Cost of Production

Recent cost account figures indicate that the cost of producing dry beans, including storage and marketing, is about \$75 an acre, and that about 30 hours of man labor are required. Costs of labor and farm machinery may be lower but only a little lower in 1950. Assuming an average yield of beans to be 20 bushels (1,200 pounds), and it was 17.5 bushels in 1949, the announced support price to those in the program would appear to offer no incentive to increase production, although it might more or less guarantee a return equal to cost of production. Here again is the

illustration that average yields are not profitable, and net gains from farm enterprises are likely to be proportionate to the amount above average the grower can attain to the point of diminishing returns.

Seed Situation

A large crop of red kidney seed was grown in California last season. However, it was harvested under very dry conditions, which means that it will be more subject to injury to germination from handling. Growers here in the East should double check germination by having the shipped-in seed tested at the Geneva Station seed laboratory. Seed certified in California is required to germinate a minimum of 85 per cent. Growers buying red kidney seed should not insist that it be large and plump. Medium sized seed is potentially as good as large, and much less of it is required to seed an acre.

There is a goodly supply of New York grown certified Michelite Pea, Perry Marrow and Yellow Eye seed available this year. Plant Pathologists at Cornell say that nothing is to be gained by purchasing Michigan certified pea bean seed so long as the local supply lasts.

Growers are cautioned about planting beans on fields which were in beans last year. The danger here is loss from the dry-root-rot or Fusarium wilt disease. Fields covered with manure from livestock fed diseased bean straw are also likely to give trouble with this disease.

To prevent rot of bean seed after planting, the seed may be dusted with either Spergon or Arasan. These chemicals are very cheap and apparently are about equally efficient. Tests have indicated that where the planted seed is exposed to cold wet soil, this dust treatment will result in a considerable increase in stand. Seed planted after June 10th is less likely to rot because the soil will be favorable for rapid germination.

Fertilizing

The fertilizer most commonly used on beans is 5-10-5. The majority of growers apply 300 pounds to the acre in bands on either side of the seed. This may be sufficient where the crop is planted on sod or where manure is used in the rotation. But it is probably not enough where beans follow another cultivated crop. In the latter case, a supplementary application of 500 pounds of 5-10-5 or 6-12-6 drilled after plowing or broadcasted over the plowed land just before fitting is recommended. This is in addition to that applied in the row with the planter. We believe it is usually not safe to apply more than 400 pounds in bands because of danger of seed and root injury. A saving in fertilizer cost can be made by using 6-12-6 instead of 5-10-5. The 6-12-6 mixture contains 20 per cent more nutrient material, but costs only about 13 per cent more. Approximately 333 pounds of 6-12-6 is equivalent to 400 pounds of 5-10-5 analysis.

Finally, it seems reasonable to assume that the acreage of dry beans will not change much in 1950 because it is a low cost of production crop as compared with potatoes, tomatoes and cabbage. Bean growers will risk less because they will have less invested in the crop. Prospects for good financial returns will as usual depend on proper choice of field, good seed, care to promote rapid germination of seed, and an ample supply of fertilizer properly placed.

Sez Zeke: "When buying plant food, I'm sure to raise Cain 'Til I get what I ask for . . . Swift's BLENN for my grain!"

New Process

Blenn

Swift's
Specialized Crop Maker

Be like Zeke! He insists on the best in plant food. You, too, will find that New Process BLENN, Swift's specialized crop maker, is your best buy for bigger yields, better all-round results. Yes, New Process BLENN is a really profitable investment. It actually lowers the cost of production per bushel. It helps to grow more from each acre you plant and to earn more money from the grain you grow.

What New Process means . . .

You've known BLENN as Swift's quality crop-making plant food. Now, through research, Swift has developed a new manufacturing process that makes BLENN even better—complete mechanical mixing, followed by complete chemical processing.

What New Process does . . .

It makes BLENN, like all Swift's Plant Foods, more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform freedom from caking, lumping, bridging; 3) uniform distribution through your machines; 4) uniform feeding of your crop throughout the entire season. Users of New Process BLENN report yields way above average for their area. And higher grades that bring top prices. There's no wiser way to "spend money to make money" than to buy BLENN.

BLENN, Swift's specialized crop-maker, is greatly in demand. Order your supply early. Then you'll have it on hand when you need it. See your Authorized Swift Agent today.

A Good Steer

A farmer said to me a few days ago, "You know, soon as I started using plant food on my hay and pasture land, I noticed the cows ate the hay and pasture a lot better—even the grass hay. I believe a cow knows what she needs, maybe better than most humans know what they need. So, from now on I'm using plant food for my hay and pastures. I get a better stand and a bigger yield."

* * *

Why not give BLENN a try on your grain? It'll add the right proportions of the right growth-making elements.

Leon Hill found out . . .

"In 15 years of farming I have used many plant foods. Last year I found the answer to my plant food 'wants' . . . Swift's BLENN increased my yields by 10% per acre. Such an increase is high, as I have always followed good cultural practices. It's proof to me that BLENN is a superior plant food for grain."

Leon Hill, Sandy Lake, Pa.

DR. A. B. GENUNG

MARTIN F. HILFINGER

ALLAN B. KLINE

GARTH A. SHOEMAKER

EDWARD R. EASTMAN

Keynote Fight for America's Freedom

By E. R. Eastman

ON FEBRUARY 24, one of the worst days so far as weather, roads and railroad transportation were concerned, more than 150 leading citizens from all parts of New York State met in Rochester to set up an organization and plan a campaign to restore and maintain the rapidly diminishing liberties of the American people.

The Rochester meeting was the result of more than a year's work of a group of representative citizens who are actually frightened at what is taking place in America and at the indifference of the average American citizen to the loss of his most valuable rights. This steering committee determined to do something to maintain individual liberty and free enterprise and to oppose the rapid trend toward socialism.

As Chairman, I opened the Rochester meeting and introduced first Mr. Martin F. Hilfinger of Buffalo, President of Associated Industries of New York State, who told about the many meetings and conferences of the smaller steering group which led up to the Rochester meeting, and then said in part that seeds of various ideologies foreign to America were taking root in this country and that the time has come to analyze and to take action on what should be done about the great questions of freedom and security.

In a short but exceedingly stirring and thought-provoking address, Mr. Garth A. Shoemaker of the Hygeia Refrigerating Company of Elmira, described that terrible period of uncertainty for America between the close of the Revolution in 1783 and the adoption of the Constitution and election of George Washington in 1789. All was confusion. There was no unity or understanding anywhere. States quarreled over boundary lines and other matters. What had been won by the great sacrifices of the Revolution were being rapidly lost. There was little appreciation or understanding of the new liberties acquired. Selfishness and indifference prevailed.

Then, said Mr. Shoemaker, a small group took up the torch, and in spite of all kinds of discouragement they agreed that something must be done. It was. The Constitution and the Bill

of Rights, the most important documents in human history, were written, signed, and put into action with the election of George Washington as our first President.

"Today," said Mr. Shoemaker, "Americans are in much the same position as they were in those unsettled and confusing times following the Revolution. We are rapidly losing our liberties, men are indifferent, and too many of us are willing to sell our liberties and our souls for a mess of pottage. So today we, another small group are here to dedicate themselves to lib-

erty and to a new Declaration of Independence."

When I presented the next speaker, Allan B. Kline, President of the American Farm Bureau Federation, I told the audience that Kline was the outstanding speaker of all America today on our basic liberties and what is happening to them. Mr. Kline said:

"This is still the country of freedom. If this country doesn't do what you think it should, it is your fault. You cannot blame the British nor the Russians. You must blame yourselves."

Kline described conditions in social-

istic England today, where he had recently visited, showing how the country was completely regimented, that no one could move to build a house, initiate or run any other enterprise without government permission and government control so binding that any real progress was impossible. "A hundred years ago," said Mr. Kline, "Britain was the world leader in education, progress and industry. But groups of cartels made the decisions. Business fell rapidly behind. For forty years Britain had gone backward until a labor government took over. The people of Britain forgot to maintain free enterprise so they lost it."

"America can still make its own decisions—or most of them—but this generation is cutting the pattern for the future of America. *This may well be the year of decision.*"

Following Mr. Kline's address, Dr. A. B. Genung, chairman of the resolutions committee, presented a series of resolutions which were debated and finally approved in principle by the meeting but referred back to the permanent committee to be re-written before releasing, to include the suggestions made from the floor. In general, these resolutions endorsed the following statement of principles which was set forth in the December 3 Forum Issue of *American Agriculturist* under the title of: "Will You Pledge Yourself to This New Declaration of Independence?"

"In view, therefore, of maintaining these basic and vital principles, we solemnly pledge ourselves to work with our representatives in the State and Federal governments, with our associates, with our organizations, with the general public, and with our friends:

I. For less government in business, agriculture, and labor.

To this end we support the Hoover Report, which calls for fewer government services and consolidation of departments and bureaus resulting in a lesser number of public employees, lower taxes, and more efficiency.

II. We will regularly and constantly call attention to the growing army of government employees, federal, state and local.

As of July, 1949, there was a total
(Continued on Opposite Page)

WHAT'S AT STAKE

As Presented at Rochester Meeting

WE ARE a group of American citizens, representing no organization nor group but meeting solely as individuals. We have watched a rising tide of statism or socialism in America and now we are alarmed that it may wholly engulf us all.

WE have seen this philosophy of statism ruthlessly exploited by politicians, who thus entrench themselves in power. We see the basic liberties of our people being cut away. We see the government rapidly moving toward the control of essential production, transportation, trade, banking, and even private property.

WE see politicians brazenly buying the favor of unthinking people by offering security without work, safety without courage, salvation without character; in short, by offering a something-for-nothing system of doles, subsidies, pensions and handouts which every sane man or woman knows can only bring us all finally to poverty and slavery.

WE see government steadily cutting down the value of our dollar by diluting the currency and by spendthrift operations that far outrun its income, even though we are loaded down with taxes that already take a fourth of every working day to pay. We are alarmed at what is going to happen to the worth of our saving, our bonds, our insurance policies, even of the paper money in our pockets.

WE see judges appointed to the highest courts, whose main qualification seems to be that they will so interpret the Constitution as to further this socialistic trend.

WE see government openly handing power over to labor monopolists until these not only control a man's opportunity to get and hold a job but can and do tie up the national economy at will.

WE see business men harassed and coerced, farmers told how many acres they can plant and how many bushels they can sell in the marketplace.

WE see bureaucratic power, under the pretense of handing out "free" bounty, moving swiftly to dominate the fields of housing, health, education, and even the church.

WE see the most precious thing that men have ever gained in all the history of civilization—individual freedom—being taken away from us and our children.

WE have reached the point where we are going to do something about this. Our forefathers shed their blood to hand down this free land to us and we do not propose to sit idly by and see this precious heritage turned into a mess of pottage for our children.

OUR present efforts as individuals may not loom large, but resolute men have made their weight felt in other times and so shall we. We are deeply in earnest.

of approximately 61½ million employees on the State and Federal payrolls, about two-thirds of whom were State and local employees and one-third Federal. These figures compare with the figures for 1940, when the total number was approximately 41½ million, with almost 11½ million of them on the Federal payrolls. It is plain that America cannot continue to exist on this spendthrift basis.

We are certain that this army of employees, with their total voting power and their natural and normal inclination to keep themselves in office, are a dangerous factor in our Republic. We are convinced that there is confusion and duplication of services, and that many of the jobs done by

We submit that an ever increasing standard of living can come only from an ever increasing production of industrial and agricultural products. We believe that free market prices with a stable price level are the best possible guides to production of agricultural and industrial products. Government subsidies and price supports must always lead to controls and restriction of production. Whenever production is restricted, unemployment increases and the national standard of living falls.

The most important factor in maintaining a stable price level is the fiscal policy of government. We believe that government attempts to inflate and deflate the currency bring about

WHAT CAN BE DONE

As Suggested at Rochester Meeting

WE FIGHTERS for freedom do not think it necessary for the lovers of freedom to come together in one vast organization at present nor in one political party, although we do propose organized effort. But what is absolutely vital is that every freedom-loving American should arouse himself to the danger, and secondly, that we shall aim at a common target.

You who read this can do more than you might think. Start fighting, by voice and vote. Begin right within your own circle of acquaintances.

1 Talk to your own family against statism and for freedom. Make sure first that your own wife, children, and relatives know what is at stake.

2 Talk against statism in your office, factory, lodge, club, church, at lunch, wherever you meet people. An audience of one is not too small.

3 Write against statism to your friends, to the newspapers, to radio stations, and above all to your representatives in Washington and the State Capital. Mention the matter even in ordinary letters on other topics. Write and write again.

4 When a political candidate, of whatever party, raises his voice for anything that smacks of statism, of handing out something-for-nothing, of government control over our property or actions—hit him hard with your voice, pen, and above all, your vote. Influence others to strike back at him. This isn't any play-spell now. It's late. We are fighting to stay free men and women.

5 When a political candidate or office holder of whatever party makes it plain that he is sincerely a fighter for freedom, fight for him and fight hard.

6 Join an organization that is working against statism and for liberty. There are many such springing up all over the country. You will get aid and stimulation from others who are fighting in the same cause. And there are more of us every day.

government employees can be better done by the individual and his organizations on a volunteer basis.

III. We are determined to emphasize at every opportunity the growing public debt, the constantly increasing current expenses of government, the ruinous effects of these, and the resulting taxes upon every business and individual in America.

We are convinced that the huge strain of ruinous taxes is increasingly retarding the investment by individuals and industry of capital in constructive enterprises. Such investments are essential to continued expansion of employment and continued growth of the country. Before the war, in 1940, the total State and local tax bill was 8½ billion dollars, and that of the Federal government was 5½ billion dollars. Now, in 1949, the State and local tax bill is 14½ billion, and the Federal is 42 billion dollars. Even excluding Federal expenses due to war, costs of the Federal government have doubled. In the last four years the government has spent more money than in all the preceding 169 years since the founding of the country. The power to tax is the power to destroy.

IV. We believe that unrestricted government subsidies and price support schemes will destroy liberty and lead to national bankruptcy. Therefore, we will urge the greatest possible use of the free market, competitive system in every segment of our economy.

instability rather than stability of the price level. We believe that thrift in government, a pay-as-you-go policy, is conducive to a stable price level and we will work to that end.

V. We believe that every American should have the unrestricted right to work and earn.

VI. We pledge ourselves to work for a better understanding of the principles on which this government was founded, between and among agricultural, industrial and labor groups and individuals in general, with a liberal and tolerant attitude toward all constructive groups and organizations in our political and social economy, realizing that peace among the nations must first start with understanding and friendship among ourselves.

A permanent committee or board of directors was elected to carry on the work for freedom. It is expected that this board will begin an active campaign to furnish freedom material to individuals, organizations and meetings, to get speakers on all kinds of meetings, including those held in city and country communities, to work alongside other similar freedom groups throughout the country, and in general to arouse the public from its apathy or indifference and to bring to all citizens the feeling of responsibility to save for ourselves and our posterity all that is good that has been handed to us through the sacrifices of the past.

Today's most widely accepted treatment for mastitis*!

SQUIBB "INSTANT-USE" PENICILLIN

EASY TO USE! Simply unscrew cap, insert tip of Squibb Penicillin Ointment tube into teat, squeeze out ointment, massage upward into quarter. That's all!

EFFECTIVE! A simple experiment, results of which are shown in this untouched photograph of a detached udder frozen for cross-sectioning, demonstrates how thoroughly Squibb Ointment disperses penicillin throughout a treated quarter of a cow's udder.

For **SCOURS** in calves and other young animals—**PENOVXIL CAPSULES**. A specially prepared, exclusive Squibb formula—only product of its kind on market. Effective—easy to use—no drenches—no injections. If your druggist isn't supplied, write to E. R. Squibb & Sons, Veterinary and Animal Feeding Products Division, Dept. AA-3, 745 Fifth Avenue, New York. Literature on Penovoxil Capsules, and other Squibb specialties available on request.

*Due to *Streptococcus agalactiae*, the cause of the largest percentage of all mastitis cases.

SQUIBB—A NAME YOU CAN TRUST

DOWN COMES THE COST of KOW-KARE conditioning

Dairymen by the hundreds have asked for a larger size of Kow-Kare, at a volume cost. Here it is . . . at a whopping saving of a third, when you buy the 50 lb. economy drum. Not all farm supply dealers will have it yet; but they'll get it in a hurry if you ask. Or, we will ship prepaid on receipt of \$16.50. Get aboard now and let Kow-Kare be working for you month in, month out. The **CONCENTRATED** Iron, Drugs, Minerals and Vitamins in Kow-Kare really vitalize your grains and roughage. **DAIRY ASSOCIATION CO., INC., DEPT. 12, LYNDONVILLE, VT.**

So You Need a Garden Tractor!

By JIM HALL

THE JOBS that our garden tractor can do are only limited by the imagination of the operator," is a statement made by one of the many manufacturers of garden tractors. Perhaps that's the best answer we can give to many readers who have asked us what kind of performance they should look for in these versatile little machines being used so generally for gardens, lawns, and odd jobs.

There is no one tractor for everyone. The full scale farmer who has his big field tractor seldom needs a garden tractor for plowing and fitting. But he does want one handy for mowing that big lawn in as little time as possible and one that will do a good job weeding and cultivating the home garden so that his big tractor can do the more important jobs in the field. No matter how bad the weeds are, he isn't going to stop haying and take time to put on a cultivator attachment for a quarter-acre garden.

"And I'm not going to push a hand cultivator through the garden after working in the field 10 or 12 hours," one dairyman told me. Then he added, with a grin, "This hand hoeing is all right for the city man who wants to keep his waist line in shape, but I don't need more exercise. And I don't have a strong wife, so I want the proper equipment to have a garden and a good-looking lawn!"

Mrs. Theodore J. Hilderbrant of Caledonia, New York, says that her husband takes time from other work on their 117 acres to plow the garden, but from then on it is her concern with only occasional help. She has a Little Beaver riding tractor and produces all the fresh vegetables and canned goods for their own family of eight. She also sells thousands of pickles, a ton and a half of butternut squash, cantaloupes and watermelons to neighbors.

More demanding in what they expect of a garden tractor are those who have small part-time farms or large suburban acreage. For these people there are one, two, three and four wheel light tractors and rotary tillers and mulifiers, and they can choose walking,

riding, crawler or wheel type machines to do an economical and back-saving job on anything from a large lot up to several acres.

Many Attachments

There are attachments available for most of them that permit the use of portable power for everything from churning butter and buzzing wood to spraying insecticides on fruit trees or paint on the house. However, some men, like part-time farmer Richard Williams of Andover, Massachusetts, get a lot of pleasure building their own.

Writing about the small farm of railroad worker Williams, Charles Stratton of Hollis, New Hampshire, one of our contributors, says, "Seeing is believing when it comes to all the jobs he does with his small garden tractor. It hardly reaches his knees, but I saw it pull a healthy 'jag' of hay through a strip of swampy land up to the barn. He can haul up to 500 pounds on the wagon which he made out of odds and ends and two wheels from a railroad baggage truck.

"Farming on a very small scale has been a hobby of his for 13 years. He has a fairly large vegetable garden, a small hayfield and five milking goats. All of his farmwork from cultivating to hauling manure is done with his garden tractor. He says he often uses it to haul out a cubic yard of wet manure and litter in one cart load."

Williams tested the homemade snowplow he designed by plowing a 36-inch strip through 15 inches of light snow. Manufacturers sell wheel weights designed to fit their models, but Williams uses two 80-pound pieces of rail iron when discing his garden. He has a 6-tooth cultivator but prefers a sweep for cultivating because it will reach a depth of one inch across a 24-inch strip.

Stratton reports that Williams does his plowing and mowing quite easily with his Garden Aid tractor. We'd like

to suggest, however, that anyone planning to plow with a garden tractor should check with their dealer or manufacturer to make sure that they are getting a tractor big enough, heavy enough, and with enough horsepower to do the kind of plowing they need. Some of the light models just aren't satisfactory for plowing, according to what some users tell us, but you'll find that manufacturers are careful to state the limitations of their various models. One user advises that if you plan a lot of heavy work for one of the larger tractors, you can save a lot of your own strength by getting one with reverse and adjustable forward speeds.

Good Engines

Today there are at least 65 firms manufacturing hundreds of different models with horsepower ranging from $\frac{1}{4}$ h.p. up. Competition is keen enough to demand efficiency of manufacture that keeps prices reasonable, and most dealers are too jealous of customer good-will to recommend a machine too light or unsuited for the job expected of it. Nor do they have to, because practically every manufacturer offers a choice of weights and power plants. Some of the tractor firms have built their own engines for years, but most offer a choice of such well known engines as Briggs and Stratton, Wisconsin, Clinton, etc.

Single wheel tractors offer the lowest price power garden units and are attractive to some buyers with relatively small garden plots. Like the larger models, they have attachments available for many different jobs and they come equipped with a kick bar to hold them upright when not in use. Far more common on farms and suburban homes of the Northeast are the two wheel models with up to $4\frac{1}{2}$ horsepower and equipped with power takeoff and belt pulleys to make them useful for a host of odd jobs. Sulky seat attachments are available for most of these, but most buyers with enough

acreage or lawn to make walking behind the tractor a chore go a step farther and get three or four wheel machines primarily designed for riding.

Prices for garden tractors range all the way from \$97.50 for a one-wheeler, up to \$695.00 for the highest priced light four wheel job. In one respect they are like field tractors or anything else you buy in a competitive market—you get just about what you pay for. If you plan to use a power garden tractor for a small plot of land and a not too large lawn area, then a low-priced, low-powered model with an attachment to push your own manual lawn mower may be all you need. On the other hand, if you have a lot of hard, steady work, it will pay to spend more in the beginning than to save a few dollars and find that you have something that wasn't built to do all you require of it. For instance, if you have a large lawn area that isn't as level as it might be, or has terraces, you'll be better off to buy a lawn mower especially designed to work with your tractor.

Attachments Are Extra

Prices quoted on most tractors are without any attachments. Sickle bars, cultivators, plows, harrows, bulldozer-snowplows, rotary snowplows, lawn mowers, discs, sulky seats, rakes, trailers, spray hose nozzles and compressors, bucksaw rigs, belts for power takeoff, seeders, furrowers and rotary tillers are a few of the available attachments that come as "extras."

Good attachments are not cheap, and we advise prospective purchasers to determine the cost of the extras they need on a machine. They can be added as the need for them arises and as you discover new ways you can put this portable power to profitable use. In some cases a cultivator might be all you need, or in the case of rotary tillers you won't need even that because they usually prepare a fairly deep seed bed in one operation.

Don't be like the man I know who bought a \$35 sickle bar to mow tall

Meet the car that's meant for you

The Styleline De Luxe 4-Door Sedan.

**So good looking . . . so rugged, smooth and powerful . . . so truly
the one car for you, your family and farm**

You expect the best from Chevrolet and here it is—the magnificent new Chevrolet for '50!

Here is America's finest low-cost car made still finer in every way. In Chevrolet for '50, with the new Powerglide automatic transmission, you get beauty and economy . . . driving and riding ease . . . comfort and safety unapproached in the low-price field.

You get your choice of 14 sleek, smart Styleline and Fleetline body types. Also offered are two great engines and two great drives—the new 105-h.p. valve-in-head engine with automatic Powerglide transmission, and the improved standard valve-in-

head engine with famous Synchro-Mesh transmission.

The thrilling new Chevrolet for '50 brings you all the big-car features that have made Chevrolet rural America's first choice through the years. It brings them to you at their very finest . . . at the very lowest cost!

So visit your Chevrolet dealer today. See the best-looking, most spirited and powerful cars in Chevrolet history . . . the cars that are again **FIRST AND FINEST AT LOWEST COST**—the splendid new Chevrolets for 1950!

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

Car operation is at its easiest in the 1950 Chevrolet! New Powerglide automatic transmission makes driving simpler, smoother, and safer than ever. And the standard Synchro-Mesh transmission with Hand-E-Gearshift makes manual shifting the easiest yet!

Combination of Powerglide transmission and 105-h.p. engine optional on De Luxe models at extra cost.

FIRST . . . and Finest . . . at Lowest Cost!

New 105-h.p. valve-in-head engine with Powerglide automatic transmission is the most powerful engine in its entire price-class. With the stepped-up standard engine, too, you get a power plant that's outstandingly durable and dependable—and a real money-saver to boot!

The lasting good looks of Chevrolet's new all-steel Bodies by Fisher jibe with a farmer's idea of practical car styling. They'll keep their beauty through years of hard use . . . it's built right into them! Here's a car that will make you proud of its smart appearance for a long, long time.

Your whole family rides in uncrowded comfort in Chevrolet's roomy interior. Those wide "five-foot" seats and luxurious new two-tone interiors add an extra treat to Sunday drives. And you'll really appreciate Chevrolet's giant-size trunk on those buying trips to town!

In this new Chevrolet for '50 you ride with unusual smoothness over the roughest country back roads! Center-Point Steering with Unitized Knee-Action Ride assures solid comfort . . . extra ease of handling. It's easy to tell that Chevrolet's the longest, heaviest car in the low-price field!

Prompt treatment of
MASTITIS
 with
AUREOMYCIN OINTMENT
 FOR UDDER INFUSION

Lederle

Brings quick results in production of salable milk

AUREOMYCIN has the broadest activity among antibiotics. It is effective against most of those organisms acted on by penicillin, as well as many other bacteria. A single infusion with AUREOMYCIN OINTMENT clears up staphylococcic as well as streptococcic mastitis in a high percentage of cases.

AUREOMYCIN OINTMENT has these advantages:

- MORE EFFECTIVE THAN PENICILLIN
- ACTIVE FOR MORE THAN 48 HOURS
- FREE-FLOWING AND SPREADS THROUGHOUT UDDER
- COWS MAY BE MILKED REGULARLY
- SAFE, WHEN PROPERLY USED
- READY-TO-USE TUBE
- SMALL, ROLLED-IN TIP INFUSION END
- NO SYRINGE OR MILK TUBES
- USUALLY ONLY ONE TREATMENT NEEDED
 (If necessary, repeat treatments at 48-hour intervals.)

This product should be used in accordance with instructions in the package literature. Maintain good management to prevent reinfection.

For maximum efficiency in the use of AUREOMYCIN OINTMENT, as well as for best management practices and disease-control procedures, consult your veterinarian.

A folder on AUREOMYCIN OINTMENT will be gladly sent on request.

Calfhood Vaccination in the Empire State

By E. V. Moore

Assistant Commissioner, N. Y. State Department of Agriculture and Markets

BRUCELLOSIS is a specific infectious disease of animals and of man (undulant fever in man). Only in rare exceptions, if ever, man contracts the disease from other human beings. Thus, the logical or complete solution of the problem of controlling brucellosis in man is to control brucellosis in animals.

There are three distinct types of brucellosis in animals, all of which are communicable to man. *Brucella abortus*, which causes contagious abortion in cattle, is communicable to man in a disease known as undulant fever. *Brucella suis*, most commonly causing brucellosis in swine, is communicable to man as undulant fever. *Brucella melitensis*, most commonly causing brucellosis in goats, is communicable to man as Malta or Mediterranean fever.

History indicates that this disease has existed in man for several centuries. Now that we know that practically all the infection in man comes from animals, it is safe to assume that brucellosis has existed in animals for a very long time. Thus brucellosis control presents two problems—the human or public health problem, and the economic or livestock health problem.

Heavy Losses

The economic or livestock problem has many complications. Untold millions of dollars have been lost by New York State livestock owners from brucellosis. The most spectacular loss to an owner is the loss of calves, particularly to breeders of purebred cattle. The loss in milk production is estimated to be from 20 to 25 per cent, and in some instances much higher. A great many cows infected with brucellosis develop sterility complications, quite a percentage of which are permanent. There is also a big loss in the market value of the infected animals as well as a further loss to the livestock owner by having the infection spread to other animals on his farm.

When I came to Albany in 1943, the major problem confronting our Bureau of Animal Industry was how to control brucellosis or Bang's disease in cattle. At that time there were two basic methods of control — test and slaughter, and calf vaccination. Our department was conducting a limited test-and-slaughter program for the control of brucellosis which involved at its maximum 2,800 herds and was costing the State \$300,000 a year. The records showed that this procedure was not economically sound and no new herds were accepted after 1940.

Before becoming associated with the New York State Department of Agriculture and Markets, I was convinced from my own clinical experience of 25 years in general veterinary practice in one of the best dairy counties in the state that vaccination with *Brucella* Strain 19 was a valuable weapon in the control of brucellosis.

We called together many representative breeders and agricultural and veterinary leaders of the State with the hope of formulating a workable vaccination program. It was the opinion of this group that any successful plan must be adaptable to any type of herd. We adopted two plans—one (Plan A) providing for annual blood test and vaccination of the calves, and the other (Plan B) providing for vaccination of calves without herd blood test. The ultimate goal of this program is to build up clean vaccinated herds. A clean vaccinated herd is one in which all unvaccinated animals over 12 months of age and all vaccinated animals over 30 months of age have passed a blood test.

Our Plan B (vaccination without herd blood test) was instituted to fit the needs of commercial dairymen and to build up great reservoirs of vaccinated cattle in order to protect the milk supply, and also to furnish replacements for vaccinated herds—not because we had any lack of confidence in the blood test. In fact, at the present time the blood test is the best yardstick I know of that we can use in determining whether brucellosis exists in an animal.

Vaccination with *Brucella* Strain 19 has proved to be a valuable weapon in the control of brucellosis. With five years' experience and with more than 829,000 vaccinated calves, we have found that, while immunity secured from calf vaccination is not a cure-all, the resistance developed in the individual animal has been very effective.

Real Progress

Since its inauguration, our calf-vaccination program has been requested by 65,000 herd owners; and we have vaccinated more than 829,000 calves. We now are vaccinating nearly two-thirds of all the calves being raised annually in New York State. These 65,000 herds under the program are more than half the total number of herds in the state. They represent a very large percentage of the commercial milk-producing herds and of the herds where brucellosis is a problem. A large percentage of the herds which have entered the program during the last six

(Continued on Page 18)

Here are 4 generations of animals bred artificially through the New York Artificial Breeders' Cooperative. The animals are standing in order with the great granddam on the left. The owner is Badgley Webb of Cherry Valley, N. Y. Mr. Webb is a charter member of the Cooperstown Artificial Breeders Cooperative. He has 26 animals in his herd and all except two are from NYABC sires.

What Alfalfa Needs

By GEORGE SERVISS

FOR HAY purposes on land that is adapted to it, alfalfa has no equal from either the standpoint of yield or quality of hay. This has been recognized by farmers and agricultural specialists for many years.

In recent years, two comparatively new legumes, ladino clover and birds-foot trefoil, have been publicized so much that we have tended to forget about alfalfa. We are not criticizing the publicity on ladino clover and birds-foot trefoil; they fill a real need and publicity is necessary to get them used to the extent they should be and in the right situations.

The number one requirement to grow alfalfa is lime. Unless a soil is limed so that the reaction is close to the neutral point, results are bound to be disappointing and the seeding is quite likely to fail. Anyone who is planning a substantial amount of alfalfa in the seeding mixture should have a test made on his soil and lime accordingly. It is unwise to guess on lime needs where alfalfa is concerned.

The next requirement is a soil that is well drained and has good depth. The deeper the soil the better alfalfa roots will go all the way to the water table or bedrock unless a tight hardpan interferes.

Third, there is the matter of fertiliz-

er, liberal use of phosphorus, and on the majority of fields in the Northeast, potash also. Farmers usually use some fertilizer at planting time, but most do not follow up with regular top-dressings. Most alfalfa is seeded on wheat or with oats and if the amount of fertilizer recommended for the small grain is used, the alfalfa will usually get off to a good start. While phosphate and potash mixtures such as the 0-20-20 or 0-19-19 plus borax may be applied at any time of the year, right after first cutting may be the best time. This is because the supply of available potash in the soil is not ordinarily as high then as in the early spring.

Grimm has been the standard variety for many years, but better varieties have been developed, although there is not yet sufficient seed supply for large scale use. **Atlantic** is the top variety for New Jersey and has outyielded other varieties in New York for stands of two years' duration. **Buffalo** ranks close to **Atlantic** in New Jersey and **Kansas Common** is preferred to **Grimm** in the southern half of the state. In New York, **Ranger** should be the number one choice for seedings to be kept three or more years; it is wilt resistant and winter hardy. **Northern Variegated** is of **Grimm** or closely related strains in origin and, so far as we can see, fully as good.

There's Money in Maple!

By JACK SPAVEN

IN A STATE known for maple and milk, some Vermonters give the nod to maple when it comes to making money. Noah Fleury of Richford, Vermont, says that his sugar bush brings him in as much money as 20 cows would.

"Sugaring returns the highest pay per hour of work of any farm enterprise. What's more, when your initial investment for the rig, buckets and other equipment is made a big share of the price received for the syrup is clear profit in your pocket. For a cash crop, I'll pick sugaring every time," says the Richford farmer.

Noah Fleury should know since he was picked as the Vermont Maple Man of 1949 by the Vermont Sugar Makers' Association. He received the E. H. Jones Maple Industry Improvement Award at the Union Agricultural Meetings held in February at Barre, Vermont. He thinks that a farmer who sells off his maple orchard for lumber can't see any farther than his nose. A lumber buyer offered Fleury \$3,000 for his sugar orchard a few years ago. He refused. The next season proved that his judgment was good because he harvested enough sap to make \$3,000 worth of syrup. He has a 260-acre farm which carries 40 milking cows. His sugar bush covers 15 acres and he hangs 2,500 buckets and has 500 additional taps connected by a tree-to-

tree pipeline.

Last season, Fleury made 537 gallons of syrup. Ninety percent of this was fancy grade. He admits that in a good sugar year he has made as much as 800 gallons of syrup from his trees.

The Vermont farmer has built his sugar bush and sugaring equipment to its present state of perfection over a 20-year period. John Weir, Franklin County forester, praises Noah for his long-range program. He has fenced his cows out of the maple orchard and thus protected the maple seedlings. He has an intensive program of thinning maple trees and cutting weed trees in the bush. Fleury has improved the layout of his sugar house and put in a new dumping tank in one section of the orchard to save time and labor.

His sugar house has a cement storage tank, which is unusual in Vermont. About two-thirds of the tank is located below ground level. It is completely covered with walls and roof and located just outside his sugar house. Fleury claims that this tank keeps the sap cool and he prefers it over the usual metal storage tank. The secret of using a cement tank, he says, is to clean it completely each time it is emptied.

The Vermont Maple Award winner collects sap from some of his best trees by a pipeline connected to the storage tank. He favors this method of sap collection and wishes that more of his trees were located on a slope so that this gravity-flow system could be used. He cautions other sugar makers on the use of the tree-to-tree pipeline saying that there must be enough slope to the line so that the sap will not collect and freeze.

Clean buckets properly stored mean high quality syrup, says Noah Fleury, Vermont Maple Award winner. Mr. Fleury is shown (right) with his son Dennis.

Peebles' KAF-KIT Must do a Job for You or it Costs You Nothing!

Now you can raise big, husky "milk-fed" calves on practically no whole milk. You can cut calf-feeding costs 1/3 or more — save 250-500 lbs. of milk per calf. Peebles' KAF-KIT replaces milk *safely* because it's *made* from milk — 98% milk serum solids plus guaranteed available amounts of Vitamins A, D and Riboflavin. That's why KAF-KIT raises calves with real milk-fed "bloom" and vitality. It's easy to feed. It remains in suspension during feeding.

See your KAF-KIT dealer now. We're so confident that KAF-KIT will develop the finest calves you've ever raised that we want you to try it at *our* risk. Feed KAF-KIT as directed for 7 weeks. If you are not completely satisfied with the feeding results, your money will be refunded. This offer is good on all KAF-KIT purchased before May 1, 1950. Don't delay! Order your KAF-KIT now.

KAF-KIT did a job for these Farmers and it can do a Job for you

"At 4 months, KAF-KIT raised calf is as big as 6 month old calf on another replacement."
D. E. Santore,
Danbury, Conn.

"I have raised 18 calves on Peebles' KAF-KIT. I like it because it seems to eliminate scours."
W. M. Church,
Auburn, N. Y.

CALFHOOD VACCINATION IN THE EMPIRE STATE

(Continued from Page 16)

months are clean or nearly clean. In most cases, Plan B herds that have been under constant vaccination for three to five years will be found, when blood tested, to be free or nearly free from brucellosis. The few remaining reactors usually are the older members of the herd and are expendable.

During the last five years while the Plan B herds have been showing marked improvement, our Plan A herds have been progressing more rapidly and we now have approved 3,436 as brucellosis free under this plan. (An approved herd is one which has not shown a reactor on two successive annual blood tests.) Under this plan we have more than 12,050 clean herds and approximately 8,500 which have only one or two reactors. Under our program to date we have 15,486 herds that are negative to brucellosis and 8,500 more almost free from the disease.

Cooperation Needed

We have demonstrated the clinical value of our brucellosis-control program by building up a large reservoir of vaccinated animals. Now that we have a reserve supply of vaccinated animals we can concentrate on increasing the number of clean vaccinated herds, which is the ultimate goal of our program.

The task, however, is still big and demands hard work and cooperation of dairymen, health officials and veterinarians. The program has not been dramatic but the results are becoming impressive, and we are confident the job can be done. It is not necessary to live with brucellosis under our vaccination plan. We are looking forward to the day when all the cattle in this state will be in clean vaccinated herds.

We of the Department of Agriculture and Markets are interested in building up clean vaccinated herds that will stay clean. There are two reasons why our clean vaccinated herds should stay clean—the individual animals have protection and the cycle of transmission of the disease has been broken. The New York State calf vaccination program has some casualties, but it is still our best defense against brucellosis. Brucellosis is a long way from being eradicated in New York State, but it has ceased to be the No. 1 enemy of the livestock industry.

—A.A.—

CUD INOCULATION

Dr. J. W. Hibbs of the Ohio Agricultural Experiment Station says that giving young calves some of the cud material from a dam is useful in encouraging rapid growth. In explaining this recommendation, Dr. Hibbs points out that the stomach of dairy cows contains certain bacteria which make proteins and vitamins available, but that there are none of these so-called rumen bacteria in the stomach of a new born calf.

The process called "cud inoculation" from old cows encourages the rapid development of these bacteria in the calf, and the calf thereby is able to use larger amounts of good quality hay and simple home-grown grain mixtures.

"Freddie Miller! You Stop Chasing My Calf!"

Choosing a Silo?

CRAINE'S THE NAME

Silos may look as like as peas in a pod—but there is a difference. It isn't easy to pick the one that's the most profitable investment for your farm.

Craine's the name that makes your choice easier. Craine silos are made in the four proven types (of wood and tile)—and there's a Craine that's right for you. No matter what your location, feeding problem and bank account, there's a dependable Craine silo that's your best feeding investment.

Send us details on your silo needs. We'll help you choose your perfect silo—by giving you all the facts, without obligation. Easy terms.

MINRALTONE HELPS BUILD CHAMPIONS

Sir Standard Bill, shown above, is herd sire for the 100 head of Registered Jerseys at Senn's Dairy, Newberry, S. C. The entire herd is MinRaltone-fed.

Noted Senn's Dairy Herd Protected Against

HIDDEN HUNGER

W. E. Senn, owner of Senn's Dairy, grows his own grain — except for concentrates. He does his own milling and mixing on the farm — and he premixes MinRaltone, as well as allowing his prize Jersey herd free access to it. Mr. Senn has this to say about MinRaltone, "We've been feeding MinRaltone for about a year and a half. It's been a worthwhile investment for us because it insures that our stock won't lack essential minerals needed for health, production and reproduction."

Now is the time to help safeguard your profits and the health and continued productivity of your stock. Follow the lead of successful dairymen — feed MinRaltone to your herd. MinRaltone protects against Hidden Hunger* because it contains 11 essential minerals with Vitamin D. Write for free MinRaltone feeding booklet and complete details.

Letters to the Editor

BLOWING OFF STEAM

I would like to ask how I can make my opinions known on some of the current political issues that would affect our industry; namely, dairy farming.

I am very much against the Brannan Plan because I feel if it is put into effect we will cease to be individual farmers and become government employees whether we want to or not.

Personally, the idea of having some guy in Washington who never saw a cow tell me what I should or shouldn't do burns me all over.

How can I "blow off steam" to congressmen?—Reader.

YOU HAVE raised some very important questions but I doubt very much if there is any single answer to them.

However, I am quite convinced that our representatives, both state and national, do their very best to reflect the opinion of their constituents. Unfortunately, however, it seems that there is some basis for the idea that when a legislator is positive in his actions, those who favor such actions are more than likely to stay away from the polls in considerable numbers on election day, while those that oppose him are certain to be there in full strength. You can't blame a congressman for thinking of those things and being very much disillusioned when he follows what he thinks is right and what some of the folks back home urge, only to find that he doesn't get re-elected.

Also, it is my own firm belief that all of us must talk less about the shortcomings of the other fellow and look more closely to our own situation. By this I mean that little is accomplished when farmers complain about the abuses of Labor and rail against those who are fostering a welfare state, if, at the same time, farmers accept high price supports and urge that they be put still higher. Likewise, nothing is gained when Labor groups claim that farmers and industry have been making big profits but refuse absolutely to correct any of the troubles within the Labor ranks.

To get down specifically to some suggestions regarding your question, the No. 1 requirement is voting on election day. Many farmers pride themselves that they never miss an election, but nevertheless records show that voters do stay away from the polls in great numbers. Nothing is quite so conducive to a perpetuation to political control—particularly by the wrong fellows.

Second, you can express your opinions to your legislators and such expressions do carry weight. To be most effective, such expressions need to be reasonable and based on facts rather than prejudices.

You can always reach your congressmen and representatives by addressing the Senator from your state at the Senate Office Building, Washington, D. C. and your Congressman by addressing him at the House Office Building, Washington, D. C.

Perhaps your influence can be just as effective if you will make your position known to heads of farm organizations; for example, A. S. Goss, Master of the National Grange, 744 Jackson Place, Washington 6, D. C., or Allan Kline, President of the American Farm Bureau Federation, 109 N. Wabash Avenue, Chicago 2, Ill.

Third, you can foster discussion of the problem facing us in your own neighborhood.

— A. A. —

Horses fed largely on coarse roughage and forced to drink ice-cold water are easy victims of colic.

TAKES 4 GOOD QUARTERS TO MAKE A DOLLAR THESE DAYS

Protect your cows.. Keep them milking with these DR. NAYLOR products

FOR BRUISED TEATS, SCAB TEATS, INJURED TEATS, OBSTRUCTIONS

Dr. Naylor's MEDICATED Teat Dilators

A profitable dairy cow must produce from all 4 quarters. Teat injuries lead to udder injuries. That's why thousands of successful dairymen would not be without DR. NAYLOR DILATORS — ready to use at the first sign of teat trouble.

WORK 3 WAYS . . . Dr. Naylor Dilators perform 3 distinct functions:

1. Carry antiseptics into teat canal to help combat infection and inflammation.
2. Furnish soft, absorbent protection to delicate lining of teat canal.
3. Keep the teat open and encourage a normal milk flow during the healing process.

EASY TO USE. Simply keep a Dr. Naylor Dilator in teat between milkings until teat milks free by hand. Dr. Naylor Dilators fit large or small teats.

... the business-like building for business-like farmers

Low cost; permanent construction; easy, fast erection; unobstructed floor and storage space—these are some of the big reasons why the arch top Timberib buildings are seen so often on America's finest farms.

The Timberib is a one-piece curved rafter that extends continuously from floor to ridge. It is formed of durable Douglas fir lumber, kiln dried and joined together under pressure with glues of permanent bonding strength. They are

Pre-cut, need no further cutting — fitting.

4 times as strong as nailed rafters.

Quickly erected with regular farm help.

Available in widths from 12 to 75 feet, lengths as desired.

If you are contemplating a cattle barn, granary, loafing barn, milking parlor, implement shed or utility building, ask us for complete information on Timberib buildings. No obligation.

"\$99³⁸ Extra Cash per acre with AGRICO in side-by-side Fertilizer Check!"

"LAST season, in a side-by-side field test, I compared AGRICO FOR POTATOES with another fertilizer of similar analysis on my Katahdin crop," writes Russell F. Carter, of Newtown RD., Pa. "Both fertilizers were applied one ton per acre, and all other factors were equal in every respect.

"Yields were carefully checked, and we found that AGRICO FOR POTATOES produced 606 bu. per acre, grading (2-inch screen) 79% No. 1's or 478 bu. of No. 1's per acre. Bear in mind, this is without irrigation. The potatoes grown with the other fertilizer yielded 529 bu. per acre and graded (2-inch screen) 75% No. 1's, or 396 bu. No. 1's per acre.

"In other words, Agrico produced 82 bu. MORE No. 1's per acre. With potatoes averaging \$2.02 per cwt., the 82 bu. (49.2 cwt.) EXTRA per acre with AGRICO meant \$99.38 EXTRA cash return per acre.

"This extra return paid the entire cost of the Agrico application almost twice over!

"This speaks for itself—there is no doubt which fertilizer I'll use in

1950. It will be the fertilizer that really pays off in quantity and quality—that's Agrico!"

Similar Results On All Crops

What Mr. Carter says about Agrico is backed up, as you'll see here, by similar results throughout New England and the Middle Atlantic States. Farmers put Agrico to the test, see for themselves what a real crop-producer it is—then use Agrico year after year, simply because they find it pays them well to do so. Laurids S. Pedersen, of Stanley RD-1, N. Y., puts it like this:

"Some years ago, when I was at Wayside Farms, Stanley, N. Y., I closely observed some side-by-side field comparisons in which Agrico produced bigger yields of better quality corn. As a result, I've been a steady user of Agrico for over 10 years, and results have been altogether satisfactory.

"In 1949, for instance, our yield was 129.39 bu. shelled corn per acre. We used DeKalb Hybrid 404A seed and plowed-down 100 lbs. of AGRICO FOR CORN along with 12 tons manure per acre on alfalfa sod. We also applied 250 lbs. of Agrico per acre when planting.

"Agrico gets a big share of the credit for this excellent corn crop, and we're glad to recommend not only AGRICO FOR CORN but the special Agrico Fertilizers for the other crops, too."

LAURIDS PEDERSEN
Stanley RD-1, N. Y.

"\$1709⁰⁰ NET GAIN from 30 Milkers on 10-acre Renovated Pasture"

D. WORTHINGTON, JR.
Great Barrington, Mass.

"Agrico gives us remarkable results on pastures and haylands," says Donald Worthington, Jr., of Great Barrington, Mass. "For First Prize Winner in the 1949 Massachusetts Green Pastures Contest. 'For instance, we re-seeded 10 acres of run-down land, fertilizing with AGRICO PHOSPHATE & POTASH, 500 lbs. per acre. Records for the same 5-month period in 1949 and 1948, for the same herd of 30 cows, show an INCREASE of 20,100 lbs. of milk, with no supplement or grain feeding. It cost \$502. to renovate the 10 acres, but the EXTRA milk alone was worth \$2,211, so we made \$1709. EXTRA net profit, which is \$170.90 extra profit per acre, or \$56.96 extra profit per cow."

"5-FOLD INCREASE IN BEEF INCOME"

J. D. BROWN, JR.
Ellicott City, Md.

"Five years ago, I started out in the feeder steer business with 500 acres of land that took 3 acres per steer," says J. D. Brown, Jr., of Beaver Brook Farms, Ellicott City, Md. "Now I am pasturing 800 steers on 500 acres for 210 pasture-days a year. The use of lime and plenty of Agrico Fertilizers and 18% NORMAL Superphosphate has enabled me to increase beef production on this farm from \$12,525. in 1944 to \$60,000. in 1949. In other words, my farm now produces 5 times as much beef!"

THESE
FARMERS
SAY:

"Fertilize with AGRICO—IT'LL PAY YOU WELL!"

R. H. BOOTHBY
Livermore Falls, Me.

"\$102⁰⁰ EXTRA CASH per acre"

"Your A.A.C. Soil Service did me a good turn by informing me in time where my soil was low in phosphorus," writes R. H. Boothby of Livermore Falls, Maine. "In 1949, on part of my potato crop, I plowed down 18% NORMAL Superphosphate, 1,000 lbs. per acre, and then made my usual application of Agrico, 2500 lbs. per acre, over the entire field.

"Where we plowed-down 18% NORMAL we dug 219 bbls. (657 bu.) per acre—39 bbls. (117 bu.) MORE per acre than where 18% Superphosphate was plowed down. Running the potatoes over the grader, we had 51 100-lb. sacks MORE per acre where we used both Agrico and 18% NORMAL—worth \$102. MORE per acre, at \$2. a sack."

VERNON M. BANDEL
Ellicott City, Md.

"21 BU. MORE CORN PER ACRE"

"I'm money ahead where I followed the advice of your Soil Service," says Vernon M. Bandel, of Ellicott City, Md. "Soil tests of my corn land showed that no lime was needed but the soil was low in available phosphorus. I decided to check your recommendations by plowing down 18% NORMAL Superphosphate on 3 acres of a 15-acre field, applying AGRICO FOR CORN as usual, 400 lbs. per acre, on the entire field.

"Where I cut the crop for ensilage, the corn on the phosphated area was heavier—you could tell by the ears going through the cutter that there was much more corn in that silage.

"But my real surprise came when I started to harvest the field corn. I got 21 bu. MORE to the acre in the plowed-down part. At \$1.25 a bu., this extra yield paid me \$26.25 MORE per acre, and I expect to profit on my next crop by the carry-over effect of the 18% NORMAL plowed down."

"NOW I KNOW THERE'S A DIFFERENCE!"

ALLEN E. METZGER
Germansville, Pa.

"We'd heard about Agrico's crop-increasing value for years, but it wasn't until 1949 that we decided to try it," writes Allen E. Metzger, of Cal-Mart Farms, Germansville RD-1, Pa. "We went into it thoroughly, comparing AGRICO FOR POTATOES against two other well-known fertilizers of the same analysis, under the same conditions in all respects.

"The net result was an average EXTRA increase of 16.2 bu. U. S. #1 potatoes per acre with Agrico. In other words, we made \$145.80 EXTRA profit on the 10 acres where we used Agrico. Now we KNOW there's a real DIFFERENCE in Agrico's crop-producing efficiency!"

DAVID GRAIFF, of Vineland, N. J., says: "In the driest season ever, when so many sweet potatoes were cracked and split, my crop, grown with AGRICO FOR SWEET POTATOES, averaged 293 bu. per acre, and the quality was exceptionally good—no cracked, over-sized sweets."

CHARLES WARNER, of York RFD, Pa., says: "We compared AGRICO FOR POTATOES alongside another fertilizer of same analysis, and by accurate measure Agrico gave us 41 bu. MORE potatoes per acre. We've used Agrico for 14 years, because it makes more money for us."

STANLEY TWINING, of Newtown, Pa., says: "A few years ago we compared Agrico against several other fertilizers. Agrico gave us the best yield and quality, so we now use it regularly. Our 1949 Agrico-grown cobbler ran over 665 bu. per acre, 80% U. S. #1, in a very dry year, with no irrigation. Agrico pays well!"

RALPH S. WALSH, of Hampstead, Md., says: "We grow canning peas and want maximum yields. By plowing-down 18% NORMAL, in addition to my regular application of AGRICO FOR TRUCK, I made \$15.40 EXTRA net profit per acre, over the cost of plow-down fertilizer."

FRANK YASKOT, of Pine Island, N. Y., says: "A neighbor recommended AGRICO FOR TRUCK as we'd been having trouble with thin-skinned onions. We used Agrico, 1000 lbs. per acre, and in a dry season, got 484 50-lb. per acre—best quality onions ever grew."

LET AAC SOIL SERVICE AND AGRICO HELP INCREASE YOUR CROP RETURNS

Take the friendly tip of these nearby farmers—use Agrico under your crops this Spring and be money ahead at harvest time. Remember, our free Soil Service will be glad to test your soil and give you economical recommendations for the crops you plan to grow. See your nearby Agrico Dealer—NOW:

AGRICO® Fertilizers and 18% NORMAL® SUPERPHOSPHATE are made only by

The AMERICAN AGRICULTURAL CHEMICAL Co.
Baltimore, Md. • Buffalo, N. Y. • Carteret, N. J. • North Weymouth, Mass. • Houlton, Me.

CLAYTON K. TROYER, of Union City R-4, Pa., says: "In 1949, we used AGRICO FOR POTATOES alongside another fertilizer of same analysis, all conditions alike. We checked yields carefully. Agrico gave us 12.4 bu. MORE per acre. Agrico cost a little more at the outset, but it paid us a lot more profit!"

E. A. WILHELM, of Centerville RD-3, Pa., says: "I found there IS a DIFFERENCE in fertilizers of the same analysis. I used AGRICO FOR CORN as half of my crop and another same-analysis fertilizer on the rest. Agrico produced 169.9 bu. ear corn per acre—6.4 bu. MORE per acre than the other fertilizer."

CAT'S PAW
Rubber HEELS & Soles

Spring is Here for the Fruit Grower

(Continued from Page 8)

I have seen. Dormant peach sprays are the only answer to Peach Leaf Curl as in the past. Parathion is going to replace other controls for Pear Psylla if it works as well as last year. By the way, Parathion is down one-third to one-half in price this year.

Pre-Blossom Sprays. Some folks feel that scab will not be too much of a problem from now on, with the new mercury sprays that do a good job of eliminating the scab after infection periods and with the steadily improving sulphurs. Last year was not too bad for apple scab but it is still a big problem and still requires close attention and complete coverage through the period of rapidly growing leaves from dormant through blossom time. The mercury compounds mixed with sulphurs are certainly going to help us knock out scab after these long rainy spells we sometimes get, but they are costly.

Having a duster around with plenty of fine sulphur dust is great insurance for those long periods—especially when you are sweating it out during blossom period. It does not pay to skimp in the use of material here; if you are going to shoot the works on dust, use plenty of it. Some of us are finding that if the ground is not too soft and the rain not too hard, spraying in the rain with double-strength flotation paste sulphur is not too bad in the daytime. The main problem we have when spraying in the rain, believe it or not, is to get water readily enough. Most pumps do not work well in the rain. Of course if you do not have boots and a good rubber suit, you had better wait until afterward and use expensive mercury. After all, no apple crop is worth a bout with pneumonia early in the season. Some folks hold up on dusting in the rain for fear of reducing the set. We have never worried much about this and when we have worried, we have had too much scab and lost out anyway.

Calyx Spray. With early calyx spray on, comes the real battle with insects. Our old friend, lead arsenate, is a must in most areas in New York State, with Curculio gradually building up and coming in fast where lead is left out. In some seasons, Red Banded Leaf Roller begins to come along in enough numbers so that DDD may be indicated in some orchards. With reasonable infestations, DDT combined with the lead will help to take care of this. Let's do a thorough job on calyx sprays. Sometimes a few extra gallons per tree will carry you the extra few days you need to catch up. You have a lot of new leaf surface through blossom time and here is where many of us fall down in getting our surfaces covered.

10-Day Sprays. Some of us are starting a little bit sooner than ten days in order to get the new leaves protected against scab and to take a heavy whack at the Red Banded Leaf Roller which should be very well hatched in the early brood. DDD seems to be the most specific insecticide we have found for the Red Banded although Parathion is very effective when thoroughly applied.

First Cover Sprays. If you can knock out the early Codling Moth completely with these first cover sprays by using enough DDT (2-3 lbs.) and by spraying carefully and thoroughly enough, a good share of your insect problems will be over for the season. Spray all trees whether they have any apples or not. Codling Moth was severe last year and there are plenty of them spun up around the trunks in the orchards. Hot, dry seasons are the ones that build up this insect. If the old Red Banded are still around by the last of July, you had better sock them again with DDD and

(DDD, a close relative of DDT, gave best results in control of red banded leaf rollers in tests at the Geneva Experiment Station. The drawback is that DDD is less effective than standard materials against the other pests that must be controlled along with the leaf roller at this period. DDD at the rate of 2 pounds of the 50% wettable powder in 100 gallons, gave almost perfect control in second brood trials last year. Extension services recommend DDT combined with lead arsenate for first brood control and favor DDD and parathion for second brood control, adding that where control of other pests like mites and aphids may be involved, parathion would be preferred to DDD since it is effective against these as well as the leaf roller.)

Parathion.

Mites a Problem in 1949. The European Red Mite and the 2-Spotted Mite have become increasingly troublesome—especially the 2-Spotted Mite, which builds up fast in the late summer and fall. Research workers have not uncovered anything new or startling in the control of these pests. Parathion has proved to be effective if applied frequently enough and Tetraethyl Pyrophosphates and DN 111 dusts do a good job on those hatched out. The trouble is that there are so many of them and so many stages that two sprays about seven days apart seem to be the only way to bring them to a dead standstill for any length of time.

The Apple Maggot has appeared again in western New York after an absence of some 20 years and proved to be a troublesome pest here and in the Hudson Valley. A regular spray program, according to the research workers, will take care of this pest except in years like last year when they came into the picture near the end of the season from abandoned and semi-abandoned orchards and trees. With economic conditions forcing more orchards out in the 1950's, you may expect more trouble from this old pest.

New Materials to Watch. In addition to the new scab eradicant materials, the fine sulphurs for the control of scab, you will want to watch the new Crag Fungicide which, after blossom sprays, promises to give terrific protection against scab. The Iron Carbamate and Fermate materials appear to control scab without any caustic effects on the foliage. In fact, they may even stimulate the foliage. Their costs will gradually come down. The effects of these materials on mites must be watched. Parathion appears to be wonderfully effective against peach insects, both borers and Oriental Fruit Moth.

— A. A. —

APPLYING FERTILIZER ON VEGETABLE CROPS

In using commercial fertilizer on vegetables there is always a question of broadcasting versus use in the row. Some crops such as beans, peas and corn are injured if the fertilizer is too close to the seed. There is more danger of this on sandy or gravelly soils.

In general, the best results from small amounts come from fertilizer applied in bands. On heavier soils you can apply as much as 400 pounds per acre of most commercial fertilizers in bands 2½ inches to 3 inches from the plants with little danger of injury.

Plowing under fertilizer when used in amounts greater than 750 to 1,000 pounds to the acre is often convenient, but plowing under all the fertilizer on sandy soils may result in loss of nitrogen by leaching.

— A. A. —

Canned peaches left from last year can be chilled and combined with fresh fruits for a summertime dessert.

The Question Box

Is it wise to seed birdsfoot trefoil with sudan grass that is to be pastured? What is considered the best annual hay crop?

I would choose either millet or sudan grass for hay. Both of these are difficult to cure and, of course, are ready for haying late when curing weather is not usually very satisfactory. Sudan grass, of course, is superior to millet for pasture, but I believe in your area I would be inclined to select Japanese millet for hay.

Soy beans make a better hay than either sudan grass or millet when they can be cured in decent shape. However, this is seldom possible in your area. Cow peas are not satisfactory this far north. They are strictly a southern crop.

Another possibility that you might consider is oats. The yield would be somewhat less but if you harvested them at the heading stage, I believe you would find the quality of hay better.

You also ask if it is wise to seed birdsfoot trefoil with sudan grass that is to be pastured. I do not believe it advisable to do this, as the Sudan would provide too much competition for the birdsfoot. It would be better to seed your birdsfoot earlier in the spring with oats. Pasturing off the oats would be very desirable.—Geo. H. Serviss.

Does pruning increase or decrease the growth of a tree?

Pruning is a dwarfing process, in that less wood is grown in a year than is usually removed. Therefore, if a tree is pruned every year it tends to get smaller rather than larger.

The fact that suckers develop in abundance on a heavily pruned tree gives the impression that pruning stimulates growth.

Several years ago there was an article in American Agriculturist describing a method of examining udders of young heifers to determine whether or not they would make good milk producers. Is there any later information on this?

There are still good indications that there is considerable merit in this plan.

It does, of course, take some skill to apply it. At present, in Ohio, Dr. T. M. Ludwick has been using this method on heifer calves in seven state institutions. None of these individuals are yet in production, but when they are, there will be an excellent opportunity to get figures on results covering a large number of individuals.

Can you describe the quincunx system of setting fruit trees?

This system calls for setting trees on the square with trees in the center of each square. These latter trees are usually considered as fillers, but often the orchardist hesitates to remove them before they interfere seriously with the permanent trees. The number of trees is doubled by the quincunx system over the number set in squares.

— A. A. —

POTATOES FOR DAIRY COWS NOW BEING OFFERED

According to Morrison's "Feeds and Feeding," potatoes compare favorably with corn silage when fed to the extent of 24 to 40 pounds per day. They are not as palatable as silage, and cows tire of them sooner. If fed in the above quantity, potatoes do not affect the flavor or odor of milk or cream. However, milk or cream exposed in an atmosphere heavy with potato odor, readily absorbs it.

How to Feed Potatoes

Potatoes must be cut up before feeding them to cows.

The easiest way to cut them up is to run them through the ensilage cutter along with some dry hay to help absorb the moisture.

Small amounts have been cut up with a square pointed shovel in a box, then fed immediately. An old fashioned beet slicer would do a good job.

Farmers can get these potatoes through their local PMA office representative. Usually the PMA office wants a minimum order of five tons. The five tons will cost \$1.00 at the potato cellar.

a tightening up, they are just as unruffled. True farm confidence gained through the years without over expansion or over retraction, and a poise and faith that is an inspiration should be an example to the hurly-burly swish and zoom of our up and down city people. Farm life does put your feet on the ground in more ways than one.

Livestock should hold its own from now on into the summer. The danger of the usual midwinter break in prices is pretty well over. Grass is not too far around the corner. This will take the pressure off forced marketing. Already inquiries are being made for livestock to pasture this summer.

This midwinter demand, mostly at higher prices, again reflects consumer purchasing power—jobs for the many. This is becoming more important than the number of head available. With farm people now a comparatively small part of our population, the great mass of people given jobs, will buy meat just as they have all winter. Strikes or any other kind of upset such as increased taxes that lower the "take home pay" in Labor's pay envelope, lowers farm prices more drastically than ever before.

With full employment and fewer and smaller "deducts" from pay checks, farm prices will pretty well take care of themselves. This is the big fallacy of the so-called Brannan Plan for Agriculture. This Plan tries to regulate

DOWN THE ALLEY

By J. F. "Doc" ROBERTS

I HAVE been on a little trip into New England and was impressed again with the people, particularly the farm people, who go along in a serene sort of way which is typically true of farm people everywhere. They took the farm prosperity of a few years ago tranquilly in their stride and today, with

"We Really Ought to Get Another One Right Away, Dear, So I Can Get Back to Driving before I Lose my Nerve."

When you build a RILCO BARN we do half the work

Rilco rafters are ready to put up when you get them. You never touch a drill or saw. Because we've cut 'em to fit exactly... drilled all the bolt holes at exactly the right places. All you do is swing 'em into position, and bolt 'em down. You can have all the framing done ready for roofing and sheathing in less than one working day! Be sure you get genuine Rilco Rafters at your lumber dealer.

Send the coupon for all the information on these strong, glued-laminated wood rafters that give you more room in a modern, attractive building.

So You Need a Garden Tractor!

(Continued from Page 14)

grass where he wanted more lawn. He used the sickle bar just once and never had to use it again—the power lawn mower kept the grass down easily.

The garden tractor and rotary tiller manufacturers who supplied us with material and pictures for this article all have attractive, multi-colored booklets describing their various pieces of equipment. Mention this *American Agriculturist* article and they'll promptly send you their booklets and price lists, and answer any specific questions you may have about their products. Some sell direct from the factory and others will advise you of the name of your nearest dealer.

Manufacturers

Tractors mentioned in the following list are two-wheeled unless otherwise noted. Variety of models is indicated by horsepower range:

S. L. Allen & Co., Inc., 5th St. and Glenwood Ave., Philadelphia 40, Pa.—Planet Jr. tractors.

Ariens Co., Brillion, Wis. — Gardener rotary tiller.

Bolens Products Division, Port Washington, Wis.—Handi-Ho, Power-Ho, Gardener and Ridemaster one, two and four-wheel tractors, 1.3 to 5.0 h. p.

Bready Tractor & Imp. Co., Solon, O.—Bready tractors 1½ to 2½ h.p.

Chain-Tred Tractor Co., 7110 N. E. 42nd, Portland 13, Oregon—Crawler type tractors 2½ to 5½ h.p.

Combination Saw & Tractor Co., Box 820, Denton, Texas—combination saw and tractors, 8 and 14 h.p.

James Cunningham Son & Co., 13 Canal, Rochester, N. Y.—Home Gardener, Truck Gardener tractors, 1½ and 4½ h.p.

R. D. Eaglesfield Corp., 2,099 Montcalm St., Indianapolis, Ind.—Eaglesfield tractors 1½ and 3 h.p.

Earthmaster Farm Equipment, 10,777 Vanowen St., Burbank, Cal.—Earthmaster tractor, 1½ h.p.

Eastern Tractor Mfg. Corp., Kingston, N. Y.—Gardenaids tractors, 1½ and 2½ h. p.

Engineering Products Co., 915 Niagara St., Waukesha, Wis.—Economy 4-wheel tractors, 6½ to 8½ h.p.

Cheston L. Eshelman Co., 119 Light St., Baltimore 2, Md.—Kulti-Mower 2 and 3 wheel tractors, 1 to 3 h.p.

Fulton Mfg. Co., 2,436 N. Grand Blvd., St. Louis, Mo.—Do-More tractors, 1½ to 4 h.p.

Garden Pal Tractor Sales Corp., 8,941 Killingsworth St., Portland, Oregon—1-wheel, 1.6 to 3 h.p.

Community Industries Ass'n., 811 So. Hamilton St., Sullivan, Ill.—George 1-wheel tractors, 2 h.p.

Grand Haven Stamped Products Co., Grand Haven, Mich.—3 and 4-wheel riding tractors, 8 h.p.

Gibson Mfg. Corp., Longmont, Col.—Gibson light 4-wheel tractors, 6 and 12 h.p.

Gravelly Motor Plow and Cultivator Co., Dunbar, W. Va.—Gravelly 1 and 2 wheel tractors, 5 h.p.

Jari Products, Inc., 2,938 Pillsbury Ave. Minneapolis 8, Minn.—Jari tractor for sickle bar or sprayer units only.

King-Wyse, Inc., Archbold, O.—King-Wyse tractor, 6 h.p.

C. M. Livingston & Son, 5,033 W. 6th, Tulsa, Okla.—Livy tractors, walking, 1½ to 5 h.p.; riding, 5 h.p.

Lodge & Shipley Co., 800 Evans St., Cincinnati 4, O.—Choremaster 1-wheel tractors, 1.3 to 3 h.p.

Marine Iron Works, Inc., 1,120 East D St., Tacoma 2, Wash.—Mighty Man tractors, 2 to 5 h.p.

Mayrath, Inc., Dodge City, Kan.—Mayrath 4-wheel tractors, 5 and 8½ h.p.

Melin Industries, Box 1, Cleveland, O.—Farm Craft tractors 3 to 7½ h.p.

Mulsifier Implement Co., 7,744 Hamilton, Detroit, Mich.—Mulsifier Rotary tiller, 6 h.p.

National Steel & Shipbuilding Corp., Harbor Drive at 28th, San Diego, Cal.—Lincoln light 4-wheel tractor, 6 h.p.

Natvik & Co., Box 162, Columbus, Wis.—Little Giant tractors, 1½ to 3 h.p.

Ottawa Mfg. Co., Ottawa, Kan. — Mule Team 4 wheel tractors 8 to 11 h.p.; 1-wheel tractor, 2 h.p.

Piedmont Tractor Co., Dept. 15, Fort Lee, N. J.—4 wheel Tiger tractor, 5 h.p.

Red-E Tractor Co., Richfield, Wis.—Red-E 2-wheel tractors 3 to 5½ h.p.; 4-wheel tractor, 4½ h.p.

That garden tractors can do a good job mowing heavy timothy is shown here. The tractor in picture is a Bready, 1½ h.p. with cutter bar attachment.

Roths Industries, Inc., Alma, Mich.—Garden King tractors, 3 to 5 h.p.; BesRo 3 and 4-wheel tractors, 6 h.p.

Rototiller, Inc., 102 2nd St. & 9th Ave., Troy, N. Y.—Roto-ette rotary tiller.

Simplicity Mfg. Co., Port Washington, Wis.—Simplicity tractors, 2 and 3 h. p.

Standard Engine Co., 601 W. 26th St., New York, N. Y.—Walsh, Monarch and Twin tractors, 2½ to 5 h.p.

Universal Machinery Corp., 1,815 N. W. Northrup St., Portland 9, Oregon—Universal tractor 1½ and 3 h.p.; and Versa-tiller rotary tiller ¾ h.p.

Waterbury Tool, Waterbury 91, Conn.—Waterbury tractors, 2 to 4 h.p.

H. C. Williams Mfg. Co., Rootstown, O.—Norm True Draft tractors, 3 to 5 h.p.

Winchell Mfg. Co., Inc., Fort Scott, Kan.—Clean Row tractor, 2½ h.p.

— A.A. —

HARDENING PLANTS

Setting out plants direct from hotbed or house to garden is likely to result in severe losses unless the plants have been hardened.

Hardening is done by keeping the soil on the dry side and by lowering the temperature. The latter can be done by raising the hotbed sash gradually or, if the plants were grown in the house, by setting them outside in a spot sheltered from the wind.

Do not check growth too rapidly or severely — just enough to enable the plant to live without a serious setback when put out in the garden.

— A.A. —

SIDE-DRESSING TOMATOES

At the Geneva, New York, Experiment Station yields of canning tomatoes have been increased where a nitrogen carrier has been used as a side dressing at the last cultivation. A fertilizing attachment to a riding cultivator is the most convenient way to apply it.

The test showed that from 200 to 300 pounds of nitrate of soda, 160 to 240 pounds of sulphate of ammonia or 100 to 150 pounds of Ammonia Nitrate per acre were the correct amounts.

Finest of all low cost tractors. Plows, discs, harrows, mows, saws, plants, hauls, etc. Has draw-bar pull for many jobs. Powerful, economical and super durable. Smartly engineered. Makes play out of hard irksome jobs. Excellent working visibility. Honor built. Designed for farmers, truck gardeners, private homes, estates, etc. Adjustable wheel widths. 16-inch row clearance. Has 8-speed Warner transmission, Rockford Clutch, 2 individual brakes, large roomy spring supported seat, Plow lift, auto type steering. Sold only direct to user at unusually low price. Prompt shipment. FREE details. In our 48th year. OTTAWA MFG. CO. 1-031 Garden St., Ottawa, Kan.

Wonderful Results Raising Baby Chicks

Mrs. Rhoades' letter will be of utmost interest to poultry raisers. Read her experience: "Dear Sir: I think I must be one of the very first to use Walko Tablets. Some 35 years ago when I started raising chicks I saw Walko Tablets advertised as an aid in preventing the spread of disease through contaminated drinking water. I tried a package for my baby chicks with happiest results. I have depended upon Walko Tablets ever since." Mrs. Ethel Rhoades, Shenendoah, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

Dampness in the Brooder House

By L. E. Weaver

AS A Southerner might say, "dampness is plumb ornery in brooder houses." The only time it is ever needed it isn't there, and as soon as it is not needed it appears and becomes a plague. It encourages coccidiosis, and probably is one of the reasons why chickens pile up and smother. Also, it makes everything messy, sticky and unpleasant.

When chicks are very small they can't drink very much even though they drink often, and they must be kept very warm. So it often happens that the air in the brooder room is so dry that the chicks actually become dehydrated to some extent, and that is not good. Then is the time, if ever, to keep the windows closed to hold moisture in the house. Fortunately that situation changes very fast. By the end of a week the rapidly-growing brood is usually eliminating plenty of moisture to correct the deficiency. After that, the problem is to keep the floor from getting too damp.

A man once told me that he was sure that wet litter is the only cause when half-grown pullets pile up in a corner and smother. Said he, "When crowding begins I dump a bushel of dry shavings in the corner and that ends the trouble at once." I've never been able to persuade other poultrymen that he was correct, but I do know I will try it if I ever get face to face with the piling problem. Then I'll clean out the wet litter and start over again.

Waterers May Be at Fault

The wettest spots are usually wherever the waterers are, but not always. Fountains set on wire-covered stands help a lot. For one thing the chicks' feet don't get quite so wet, and it seems to me that a lot of wetness is tracked around the house by chicks with wet feet. Improved styles in drinkers are practically doing away with the wet spot around the fountain. The chicks can't get their feet into the water, and the waterers are so shallow or narrow that only the beaks get wet.

Ventilation Essential

As long as there is no way for damp air to get out of the room, the floor is bound to stay wet. This is so very true that in modern broiler houses where thousands of chicks are crowded into one big room, large exhaust fans must run constantly to carry off the moisture and pull in fresh air. Even if it does take a little more coal or oil or electricity or gas to keep the chicks comfortable you will be wise to open the windows or ventilators wider and wider as the chicks grow older and larger.

(Continued on Page 26)

—Cornell University Photo.

Wire-covered platforms for drinking fountains may be of any size or height. They help keep the litter dry indoors and prevent muddy bare spots on range.

FORTIFIED for Life!

Potent in the
Animal Protein Factor
from natural sources:
also fortified with
additional ATP
Supplement.

Most poultrymen know that the first few weeks of a chick's life are the most critical. For during this brief period the chick must be amply supplied with every vitamin, mineral, protein and other nutrient needed to build a strong body, frame and vigorous organs... to lay the foundation for later sound growth and maximum production.

That's what we mean by "Fortified for Life." Obviously, no starter can supply the nutritional needs of the bird for the rest of its life. But, there is no more complete, more carefully balanced starter than Pratt's. None will give a chick such a fortified start towards becoming a strong, healthy, heavy-laying hen.

And Pratt's "Double-Duty" Chick Starter is more than just an excellent starter—it is a corrective feed as well. It is made so rich in all critical nutrients that the first few

ounces can head off many troubles that begin in the egg.

For Pratt's will overcome many cases of Nutritional Leg Paralysis... Rickets... Hock Disease and others which begin in the shell... which chicks inherit from the egg.

Ask any constant feeder of Pratt's "Double-Duty" Chick Starter in your neighborhood. He'll tell you that Pratt's will not only give your chicks the best start ever, but will give deficient chicks a second chance as well.

Then, you too will insist on Pratt's "Double-Duty" Chick Starter from your local dealer. Your egg production records next fall will prove that it does "fortify your chicks for life."

FREE! "Their Life Is In Your Hands," the new edition of Pratt's booklet of practical chick-raising help. Write Pratt Food Company, Dept. BC-9, Philadelphia 6, Pa.

DAMPNESS IN THE BROODER HOUSE

(Continued from Page 25)

The investment in that extra fuel may yield a fabulous return. It could easily be 100 per cent.

Overcrowding

Another cause of wet litter is overpopulation. By the time a person has been in the poultry business ten years or so he will tell you that he can make more money with 100 pullets that were grown right than with 150 just average pullets, and that you can't grow good pullets under crowded conditions. It takes most of us many years and much lost money to learn that fact. It's known as "the hard way." The hope springs eternal that this year we will be lucky and get away with crowding in more than we know we ought to. Fewer chicks would mean dryer litter. Maybe that's the reason that they grow up into better pullets. There is nothing wrong about starting two chicks for every square foot of floor, provided you move half of them to other quarters as soon as they can do without heat, and spread them still thinner when the litter begins to get sticky.

It Can Be the Feed

Many poultrymen have discovered that as soon as they begin the feeding of grain at around 7 or 8 weeks, the wet litter problem is not so bad. It may clear up entirely. There are two good reasons. Last summer at the Poultry Science Association meeting experiments were reported which showed that the more protein in the ration the more water the chicks drank and expelled in the droppings. Also, the higher the percentage of soybean oil meal, the more water the chicks drank and expelled. For the broiler grower this presents quite a problem because soybean oil meal is an excellent and relatively cheap source of protein, and the rate of growth slows down when the chick eats less protein, as happens when you start feeding grain. But the man who is growing pullets for layers need not worry. In fact this may be just what he is looking for. If grain feeding doesn't actually keep the pullets from "laying too young," it can at least cut down a little on the cost of growing them.

In Conclusion

Don't let the brooder room get too dry the first week to ten days. After that, to keep the litter from getting damp, keep windows or ventilators open at all times, increasing the size of opening as the chicks grow. Don't

overcrowd. Use wire stands or "dry litter" drinkers. Start grain feeding at 6 to 8 weeks, to which we might add, use a fairly deep litter (except where floor heat is used) and keep the litter loose by daily stirring.

The Poultryman's Question Box

My poultry house has not been used since I sold the laying hens in December, 1943, and went to California to do war work. This fall we returned and started some poultry for the coming season. The old litter of sawdust was never cleaned out. It was used about four months and has been dry at all times, as this poultry house has a ventilation system to prevent litter from getting wet while in use. I remember reading somewhere that old litter was good to use. Would it be advisable to use this again or should it be cleaned out and new provided?

The only reason I can see for not using the old litter which you mention is the possibility that it may be very moldy. Sometimes when chicks inhale moldy dust they get what is known as brooder pneumonia or aspergillosis. I think if there are any large lumps in the litter I would remove those.

—L.E.W.

I have a back yard flock of 25 hens which are producing pretty well. Would I save money by mixing my own ration?

No! The trend has been toward less home mixing, and certainly it isn't worthwhile especially for a small flock. You will get far better results by selecting a poultry ration put on the market by one of several reliable poultry feed companies and feeding it according to the manufacturer's directions.

My old hens are very slow in coming into production. I am tempted to sell them.

If you do sell them, the chances are you will sell them about the time they are ready to start laying. Old hens need a vacation but shouldn't expect to loaf forever. If they are well-bred and if they are fed properly, they should produce after a lay-off. If they don't, and if they show no signs of laying, dispose of them. It is probable that careful culling early last fall would have removed non-producers then and saved you a lot of feed.

What is meant by the term "pedigreed chicks?"

The term is not absolutely standardized. In general, it means that the parent stock has been tested. The hens are often trap-nested, or at least come

BABCOCK'S Healthy Chicks MAKE GREAT LAYERS

Last year ('48-49) our White Leghorns won as follows at the official egg laying tests: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird) for high average production all breeders in U. S. competing. This is highest average ever made. 6. We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND We hatch White Leghorns, Red-Rock Cross, Rhode Island Reds, and Barred Rocks all year... own two hatcheries, with 530,000 egg capacity—three poultry farms and 15,000 breeders. We also carry on a complete pedigree-progeny testing program.

RICHQUALITY CHICKS

ARE MONEY MAKERS

WE produce chicks for commercial poultrymen who are interested in birds that live and produce lots of big eggs. We have been improving our strain of White Leghorns for 38 years.

OUR chicks are as disease-free as modern science knows how to make them. Here are some of the reasons why: (1) We produce all of our own eggs on our own farms. (2) Our flocks are proved "Pullorum Clean." (3) All stock is vaccinated against Newcastle.

VISIT our hatchery in Hobart, N. Y., or write for new free catalog.

TIME AND LABOR SAVER FOR THE EGG GRADER

An egg grading cart, made from war surplus materials for \$22, is saving the University of Vermont poultry farm over \$180 a year. The cart holds four cases of eggs, one for each grade. It fits neatly under the egg grader and saves more than a half-hour a day in grading time. Lifting of the crates is also eliminated by the cart, report D. C. Henderson and Harry Whelden of the Vermont poultry department.

BETTER HEALTH FOR CONSUMERS

(Continued from Page 1)

sums to research which, in some cases, is administered by the National Dairy Council.

The American Dairy Association program of advertising is directed at creating a WANT for our product in the mind of the housewife. How many times have you heard this in your own home: "Oh dear! What are we going to have for supper?" If you will observe the advertisements that the American Dairy Association is now displaying in the leading women's magazines, you will find that many of them carry recipes using dairy products. Our program is flexible, and as we discover better ways to reach the public we propose using them.

The distribution of milk is changing. We find that there is a rapid increase in the sale of milk over the counter in stores. Here we witness some of the excellent results of A.D.A. efforts to get milk out from under the counter and to do a real merchandising job by putting milk up in sight in fine refrigerated cases. Today, 76 per cent of all customers shop without a shopping list, and this unplanned shopping has increased 55 per cent in the past 13 years. Today, 82 per cent of the food dollar is spent in the self-service stores and the trend is upward.

The American Dairy Association proposes to have dairymen ready for their share of this business. In our advertising we strive to use informative ads because our studies show that such advertisements out-sell others three to one. We know that 83 per cent of women readers read and clip recipes. We are after their business. We are pre-selling our product before our customers go into their neighborhood store. Good advertising will make people want the products advertised.

I have an abiding faith in my fellow dairymen. I believe if given the opportunity to work out a sales program for themselves, they will rally to it and get results. I sincerely hope that this faith is not misplaced. As a dairyman, how much will you do for yourself in promoting the sale of your milk? Do you agree with me that if we are looking for a helping hand we will find it at the end of our own right arm, and the sooner we get to using it the better off we will all be? If that sounds reasonable, and if you have not done so already, won't you bring that helping hand of your own into action and sign an authorization for the deduction of one penny a cwt. for "Milk for Health?" Every authorization signed now will save time and money toward getting at our program. The time is getting late.

Some authorizations are made by cooperative associations on action of the directors, but each dairyman who does not belong to a cooperative is asked to sign an individual authorization. You can get such an authorization and answers to any questions you may have by dropping a postcard to "Milk for Health, Inc.", Onondaga Hotel, Syracuse, New York.

— A.A. —

An interesting booklet of 98 pages has just come to our desk. Its title is "SUCCESSFUL GOOSE RAISING"; the author Lewis Glazer of the Yankee Goose Farm, Box 123, New Haven, Conn. The book covers the matter of breeds, feeding, incubation, management, fattening, slaughtering and dressing. The price of the book is \$1.00.

ABERDEEN-ANGUS SALES

Two Aberdeen-Angus sales within three days will attract many cattlemen to Dutchess County, N. Y., in early April. Four bulls and 60 heifers will be offered at the Fuerst and Bethel Farms sale at the Fuerst Stock Farm, Pine Plains, April 1. The following Monday, April 3, 5 bulls and 60 females will be offered at the Ankony Farm at Rhinebeck.

Chief attraction from the Fuerst Farm is Evergreen 4th of Globe Hill, undefeated senior calf of the 1949 show season, and 6 of his half-sisters and one of his half-brothers.

Bethel Farms will feature 2 sons and 12 daughters of their senior herd sire, Bethel Bandolier; and 6 heifers bred to their International Reserve Champion bull, Dal'bairn Bandolier. Their feature heifer will be an Erianna, the only one to be sold in the East this spring.

The Ankony Farm sale at Rhinebeck will feature the get-of-sire of Eileenmere 1032nd, 1949 grand champion bull.

CORRECTION

We regret that some of the early copies of the March 4 issue were mailed before we discovered an error in the article entitled, "Operation Empire!" The President of Empire Livestock Marketing Cooperative is Eugene P. Forrestel and other directors are: Palmer C. Flournoy, Harold M. Stanley, Clarence E. Johncox, Ernest O. Strobeck, George W. Slocum, Newell S. Hutchinson, J. Stanley Earl, Clayton G. White and James A. McConnell.

Plan has the full force of government with its unlimited publicity and dollars behind it.

Right now, government dollars are telling you in all sorts of ways and places this: (and it makes sense without the full story) We are now selling potatoes at 1c per cwt. which we bought anyway and could have sold to you consumers for 30c a bushel. You would have saved 75% of your potato bill this winter and we, (the government) would have lost less by millions of dollars. Your taxes would have been less and your food bill less. Doesn't that sound wonderful? Everybody makes money just by somebody like Brannan thinking up a plan.

It may not seem possible to you, but it is now probable that the power of government, plus such talk, will put this Plan over on all of us. There are some who believe that the government potato, egg, butter, etc., mess was deliberately planned that way, just so its bungling would be so apparent that it could now be said, "If we had had the Brannan Plan this could not have happened. Now we must have it soon." Impossible as it may seem, many people are already believing this line of reasoning.

"What Can I Do?" is a popular song right now. Write to your Congressman, or better still, dictate such a letter to your school boy or girl so that they will get the benefit of your experience.

COMPLETE DISPERSAL

Mr. & Mrs. E. B. Weaver's Holstein Herd at their farm on Route 22, Copake, Columbia County, New York.

goes the RECORD

For months, conceptions on first services in members' herds have been the highest in history. Last available 60-90 day non-returns showed 76% -- on the average, more than 7 of ten cows are conceiving on first breeding.

NYABC Members, who own and control their dairy cattle breeding organizations cooperating with their inseminators, local directors, headquarters employees, extension men plus their support of research efforts, have helped make this record.

The superior offspring from these conceptions are a matter of record. For details -- in Western Vermont and New York State, call your local unit that is affiliated with NYABC, or write directly to:

NYABC

Eggs and Chicken A-plenty!

By GRACE WATKINS HUCKETT

For a company meal, it is hard to beat fried chicken, well done and cooked to "fork tenderness." The tender, light-weight birds are especially suitable for frying or broiling.

—Photo by Poultry & Egg National Board

Grated cheese, sprinkled on this omelet before turning it, adds just the right touch. Served with piping hot creamed asparagus, it is a dish fit for a king. It's easy to make; just follow the simple directions on this page.

—Photo by National Dairy Council

BOTH eggs and chicken are abundant now, and this is the time to enjoy them most and to use them freely. Besides being good eating, they provide minerals and vitamins which help to keep you and your family healthy and feeling good. They also have the advantage of lending themselves to such a great variety of cooking methods that there is no reason for serving them in the same old ways day after day.

A puffy omelet, browned just right and oozing with a creamed vegetable, is an enticing dish for supper or lunch. For a real masterpiece, try it with creamed asparagus (canned, frozen, or fresh):

OMELET WITH CREAMED ASPARAGUS

6 to 8 eggs	2 tablespoons butter
$\frac{3}{4}$ teaspoon salt	2 cups diced, cooked asparagus
$\frac{1}{8}$ teaspoon pepper	$\frac{1}{2}$ cups medium cream sauce
$\frac{1}{2}$ cup milk	
$\frac{1}{2}$ cup grated American cheese	

Beat egg whites until stiff. Beat egg yolks until thick and lemon colored. Add salt, pepper and milk, stirring to blend. Fold egg yolk mixture into whites. Melt butter in skillet, turning to cover bottom and sides of pan. Add omelet and cook over low heat about 8 minutes, until golden brown on under side. Remove from heat and place in moderate oven, 350° F., for 5 to 7 minutes, until surface is set. Loosen sides with spatula. Cut lightly through center without cutting completely through omelet. Sprinkle with grated cheese, fold over and turn onto hot platter. Top omelet with piping hot creamed asparagus and serve immediately. Serves 6.

ZESTY BAKED EGGS

$\frac{1}{3}$ cup salad dressing or mayonnaise	$\frac{1}{2}$ teaspoon Worcestershire sauce
$\frac{1}{4}$ teaspoon salt	$\frac{1}{2}$ cup milk
$\frac{1}{8}$ teaspoon pepper	1 cup grated sharp cheese
$\frac{1}{2}$ teaspoon paprika	8 eggs

Combine salad dressing and seasoning. Gradually add milk, stirring after each addition until smooth. Add cheese and cook over low heat until cheese is melted, about 5 minutes. Pour 2 tablespoons of the sauce into each of 4 individual greased baking dishes. Break 2 eggs into each dish and top with remaining sauce. Place in pan of hot water. Bake in a moderate oven (350° F.) until eggs are desired consistency, 12 to 15 minutes. 4 servings.

CHEESE SOUFFLE

2 tablespoons butter	4 eggs, separated
4 tablespoons flour	$\frac{3}{4}$ teaspoon salt
1 cup milk	$\frac{1}{4}$ teaspoon dry mustard
$\frac{1}{4}$ lb. sharp cheese, chopped	$\frac{1}{8}$ teaspoon pepper

Melt butter, add flour, blend well and

cook over low heat until bubbly. Add cold milk all at once and cook, stirring constantly, until thickened throughout. Add cheese to white sauce and stir until melted and well blended. Add mustard, pepper and sauce to yolks, beating constantly. Add salt to egg whites and beat until shiny and whites leave peaks that fold over when beater is withdrawn. Pour yolk-cheese mixture gradually over egg whites, folding at the same time. Pour into an ungreased $1\frac{1}{2}$ quart casserole. Circle mixture with a spoon about 1 inch from side of casserole and about 1 inch deep. Set in pan of hot water and bake in a slow oven (325° F.) until puffy, delicately browned, and a knife inserted in center comes out clean, 60 to 75 minutes. Serve promptly. 4 servings.

EGG SAUSAGEBURGERS

1 lb. pork sausage	for cooking
2 tablespoons finely chopped green pepper	eggs, beaten slightly
2 tablespoons finely chopped onion	$\frac{1}{2}$ teaspoon salt
2 tablespoons sausage fat	$\frac{1}{8}$ teaspoon pepper
	8 buns

Mold sausage into 8 patties to fit buns and fry. Meanwhile, cook green pepper and onion in fat until onion is transparent but not browned. Blend eggs and seasoning and add to onions and green pepper. Scramble over low heat. Place 1 sausage patty topped with a tablespoon of scrambled egg between split bun.

Serve hot with relishes—8 burgers

SOUFFLED CHEESE SANDWICH

6 slices bread	$\frac{1}{4}$ teaspoon salt
Sliced cheese to cover bread	3 eggs, separated
	$\frac{1}{4}$ cup salad dressing

Toast bread on one side. Cover untoasted side with cheese. Add salt to egg whites and beat until shiny and whites leave peaks when beater is withdrawn. Add salad dressing to yolks and

beat until light. Fold yolk mixture into whites. Heap on top of cheese. Bake in a moderate oven (350° F.) until puffy and brown, about 15 minutes. Serve promptly. 6 sandwiches.

For the person who carries his lunch, try mixing hard-cooked eggs with chopped celery, green pepper, pimiento, chopped ham, chopped pickles or chopped fried bacon. To make the idea of scrambled eggs still more interesting, mix into them, while cooking, chopped meat, chopped nuts, or chopped bacon. All of these may be moistened with mayonnaise or any salad dressing. Egg fillings by themselves are apt to be too bland and uninteresting, and although little seasoning is best for the very young, the older child or adult prefers the peppier mixtures.

For a company meal, it is hard to beat fried chicken, well done and tender. If you're one of the women who object to standing over a splattering skillet at the last minute before serving a meal, here is a method that will yield a delicious fried chicken without that objectionable feature:

FRIED CHICKEN

Put into a paper bag one cup flour, one tablespoon salt and $\frac{1}{4}$ teaspoon pepper; 2 tablespoons paprika (optional); $\frac{1}{2}$ teaspoon poultry seasoning (optional); mix well. Wipe pieces of chicken dry and shake them in the paper bag, one or two pieces at a time, until well coated with the flour mixture. Let coated pieces stand, preferably on a rack, to dry for a few minutes so coating will stick. Bread crumbs, corn meal and flour or cracker crumbs, may be used for the coating. $\frac{1}{3}$ cup cornmeal and $\frac{2}{3}$ cup flour mixed together make a better coating than all

cornmeal, which is apt to be dry and hard. If using egg and crumb covering, roll pieces of chicken first in crumb, then beaten egg diluted with 1 tablespoon milk or water and in crumbs again. At least 3 inches of deep fat are needed for frying because of the thicker coat.

For the flour or flour and cornmeal, put enough fat into a heavy skillet to make about $\frac{1}{2}$ to $\frac{3}{4}$ inch layer (do not crowd). Any good fat may be used. Cook chicken in hot fat until golden brown, 12 to 15 minutes; turn pieces occasionally so they will brown evenly; then place the pieces in a shallow baking pan and spoon over them a mixture of $\frac{1}{4}$ cup melted butter or fryings from the chicken and $\frac{1}{4}$ cup broth or milk. Bake in a moderate oven (350° F.) until chicken is tender, about 25 to 30 minutes. If the pieces appear dry, give them another treatment with the butter mixture.

The same oven-finishing may be given to broiled chicken, especially convenient if the party is large. Keeping fried or broiled chicken hot until serving time is always a problem, especially with gas or electric stoves, and this seems to do the trick.

GRAVY

For a non-greasy gravy, pour out all the frying fat, then measure into the skillet 2 tablespoons fat for each $1\frac{1}{2}$ cups gravy desired, being sure to return the browned crumbs. Measure into the skillet two tablespoons flour for each two tablespoons fat. Cook over low heat, stir until fat and flour are blended and frothy; add $1\frac{1}{2}$ cups cold chicken stock or milk or combination of these all at once. Cook, stirring con-

Aunt Janet's Garden

Imagination Helps!

MY house plants this past winter were grown chiefly from slips given me by friends—5 varieties of begonia, some sultanas (or impatiens), a geranium, a coral cactus, 2 thick-leaved succulents whose name I still do not know. My beautiful hybrid cyclamen is strictly a greenhouse product. I hope I'll be able to bring it into flower again.

The tall-growing begonias soon began to look like a forest, so I clipped off the tips and have used them in arrangements. All winter I have had these little branches of attractive leaves and rather inconspicuous flowers to use in a low shallow bowl, with glass birds wading in the water, or to use as a "foundation" in a vase with leafless forsythia which had been brought in and forced into bloom.

From Mrs. Alma L. Gale comes this suggestion as to how she lends interest to her wintertime table. She bought an inexpensive 12-inch-in-diameter mirror on which she places any green or growing thing, or any object of interest, such as sea shells with pink interiors

reflecting to good effect. She sometimes uses crisp spinach, avocado pear and a couple of lemons, all of which offer contrast and interesting forms.

Just recently I was delegated to decorate tables for a spaghetti supper given by a church group. They wanted something Italian in spirit. It being midwinter, with traditional flowers and fruits of Italy at a low ebb, I was stumped and appealed to a friend for an idea. As usual, her fertile imagination responded with what turned out to be an inspiration. She suggested making a "Della Robbia" down the center of each table.

I found crepe paper of the proper shade of madonna blue, made a strip about 8 inches by 6 feet for background, ruffling the edges a bit. I got small branches of the most laurel-looking leaves I could find, on my shrubbery and the neighbors', and made a trailing "vine" down the center of the crepe paper. Then at irregular intervals, on either side of the "vine," we arranged, singly or in groups, such fruits as the shops had at the time, tangerines, small oranges, limes, tomatoes, red apples, bananas, grapes, even tiny yellow and green squashes. It didn't take many pieces of fruit—variety in color and shape being a chief consideration, and most of the fruit was used afterwards!

Oneida County Cook Wins New York State Grange Contest

Mrs. Stuart Germond (left) of Marcy, New York, receives congratulations as the winner of 1st prize in a contest sponsored by the New York State Grange. Mrs. Germond is another prize-winning cook who prefers Fleischmann's Yeast. "There's just no substitute for the best," she says. "I wouldn't risk using any yeast but Fleischmann's, because I know Fleischmann's is always good and lively and gives me best results every single time. It's the one yeast I've used for years—and it's never let me down."

Try it yourself. See why the country's prize-winning cooks prefer Fleischmann's Yeast to all others.

DELICIOUS, FLUFFY Muffins!

5 doctors prove this plan breaks the laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

LOW COST HEARING DEVICE

No Tubes, No Batteries, No Upkeep. Just a simple ear plug made of a non-toxic plastic. Many satisfied users.

JOHN BEAUDRY

4337-U-30th Ave. So., Minneapolis 6, Minn.

Too Tired At Day's End?

IF YOUR kitchen cupboards are too low or too high, you're using up unnecessary energy—energy that you might prefer to save for other things, such as playing outdoors with the children, or going to a movie in the evening, or working on your favorite hobby. That's the word from the College of Home Economics at Cornell University.

According to Mrs. Esther Crew Bratton, assistant professor in the college's home management department, a woman uses up eleven times as

If you want to conserve your energy, this is the right height for a frequently used cupboard shelf (46 inches, to be exact), says Cornell Home Management Specialist Esther Crew Bratton as she reaches for some tumblers.

much energy when she stoops to pull a kettle from a bottom shelf as when she takes it from a shelf 46 inches from the floor. When she stretches up to pick a dish from a shelf 6 feet from the floor, she is using four times as much energy as when she takes one from a 46-inch high shelf.

Mrs. Bratton points out that wasted energy is one of the factors in fatigue, and is no more justifiable in the home than in the shop. "Even with all the labor-saving devices now available," says Mrs. Bratton, "many homemakers complain of being too tired at the end of the day. Work spaces and equipment in kitchens still need improvement to prevent unnecessary use of energy."

Nine healthy young housewives, most of them the mothers of small children, cooperated with Mrs. Bratton in her study of kitchen fatigue, and it is hoped that the results of the tests may be of value to architects and designers of household equipment.

— A. A. —

DISHWASHING STRATEGY

CLEANING up afterwards is often the hardest part of meal-getting, but this chore can be simplified by employing a little before-hand strategy.

First of all, learn to be as conservative as possible in the use of utensils and tools used for food preparation. Sift flour on wax paper. Use the measuring cup first for dry ingredients and then for liquids. Make a habit of rinsing or soaking utensils and tools as soon as the food is removed. Cold water is best for rinsing or soaking pans and dishes which were used for milk, egg, cereal or dough mixtures.

Strainers are easily cleaned if immediately scrubbed with a brush under a hot water tap, or put to soak at once. Dishes which are scraped and rinsed as soon as a meal is over are easier to wash than when the ordeal is postponed.

Keep a tray at the side of the range

THE HEART REMEMBERS

By Edith Shaw Butler

Squirrels are busy
And chickadees
Sing a brief song
From orchard trees;

And cradle knolls
Begin to show
Patches of grass
Above the snow.

Sun and wind
Are working now
To swell the bud,
The waiting bough;

And the heart remembers
Countless springs
When, suddenly,
A bluebird sings

to hold cooking spoons, etc., during meal preparation. Then they won't disappear and also they won't leave gooey little dabs that stick to work surfaces and add to dishwashing time. A shallow enameled tray is nice for this purpose and is easy to wash.

If you liked broiled chops, etc., but hate to clean the broiler, use a rack in a large frying pan to set your meat on. It's easier to clean the frying pan than the broiler.

A folded newspaper is a handy, disposable aid for keeping work surfaces clean when doing such jobs as squeezing oranges, cutting bread, mixing ingredients, cleaning vegetables, paring apples, and so on.

— A. A. —

KEEP SHAPE IN RAG RUGS

Here is how I wash my crocheted or woven rag rugs. They look very nice, lie flat, keep their shape.

I do not put them through with the rest of the wash, but wash them separately in rich suds and warm water. Rinse until all soap is removed and water is clear. Then dip each one into a light starch solution, wringing out as much of the water as possible. I never hang my rugs on the clothes line but instead lay them out flat on a newspaper and pat into shape. The starch gives them body, making it easier for them to stay flat.—B. C.

— A. A. —

TO IMPROVISE A RING MOLD

If you need a ring mold and you do not have one, you can improvise one in a hurry if you fill a glass fruit jar with chopped ice, and place it in the center of a bowl. Pour the mixture to be molded around the jar and set in the refrigerator until it is thoroughly chilled and set. To unmold, remove the jar and invert upside down on a large plate or platter.—B. C.

— A. A. —

EGGS AND CHICKEN A-PLenty

(Continued from Page 30)

stantly until thickened. Boil approximately 2 or 3 minutes. Add ½ teaspoon salt and ¼ teaspoon pepper, stir in well and add more seasoning if needed. Serve gravy very hot.

MARYLAND CHICKEN

Coat pieces of chicken with seasoned flour as for fried chicken; put pieces into beaten egg, diluted with 1 tablespoon water for each egg, then dip into soft crumbs. Place in well-greased pan, preferably one layer deep; bake 1 to 1½ hours in a moderate oven 350° F., basting frequently with a mixture of half water. Serve with a hot cream sauce to which chopped parsley is added just before serving.

It includes factual information—such as timber-marketing tips, estimating tables, and suggestions on the best methods of harvesting a timber crop—of value to any owner of wooded farmlands. Write to McCulloch Motors Corp., Los Angeles 45, Cal., for your free copy of Bulletin No. 493.

Entertaining at Dessert

By RUBY PRICE WEEKS

DESSERT entertaining has become very popular for several good reasons. Not too much food has to be prepared, and it is served at a time which doesn't interfere in any way with the regular routine of the household—usually from one to two o'clock in the afternoon, or seven to eight in the evening.

Another strong point in favor of dessert entertaining for an afternoon party, whether followed by bridge, knitting, or just chatting, is that the guests and the hostess have just as good an appetite that evening for supper as their families have! The result is that the family gets a meal which is "tops" instead of the sketchy one that often follows an afternoon party with late refreshments.

If you are entertaining a small group, they may all sit at one table, but if many people are being entertained, food is best served from a buffet table. In either case, arrange an attractive centerpiece. This may be of flowers, fruit, vegetables, or interesting figurines. It will depend upon the time of year, what one has to use, and individual ideas regarding centerpieces.

Dessert may be eaten while standing about the room chatting, and it should be something easy to eat that way. But if you think the guests would enjoy the party more if seated, they may take the food to card tables which are set up with matching lunch cloths and napkins. Filled water glasses and silver are needed.

Among the desserts good for some parties are shortcakes—strawberry or peach (fresh or frozen)—with lots of the fruit and whipped cream. With this, all else needed is salted nuts and a beverage, hot or iced, depending on the day.

Another delicious dessert is a favorite homemade frozen dessert with angel food cake. Cream puff or éclair cases are always good served filled with

vanilla ice-cream and chocolate over the top.

Here is a recipe for an unusual dessert, and all one needs to serve with it is coffee:

PINEAPPLE MERINGUE CAKE

1/2 cup butter	5 tablespoons milk
1/2 cup sugar	3/4 cup sugar
4 eggs, separated	1 cup chopped nuts
1 cup sifted flour	1 cup whipping cream
1 teaspoon baking powder	1 No. 2 can crushed pineapple
1/2 teaspoon salt	

Cream butter and 1/2 cup sugar thoroughly, add egg yolks one at a time, beating until very light. Add sifted flour, baking powder, and salt alternately with milk, mixing just to blend. Pour into two layer cake tins, well oiled. Beat egg whites and 3/4 cup sugar to make a meringue, spread over cake in both tins, sprinkle with nuts. Bake 30 minutes in a moderate oven (350° F.). Cool, remove from tins, put one layer on large serving plate. One half hour before serving spread bottom layer with whipped cream, mixed with thoroughly drained pineapple (or other fruit). Top with outer layer, chill. Cut at the table. Serves 10.

DATE DESSERT

1 pound dates, cut up	1/2 cup sugar
1 cup walnuts, cut up	3 tablespoons flour
2 eggs	1 teaspoon baking powder

Beat eggs thoroughly with the sugar. Add flour and baking powder sifted together, then dates and nuts which have been dredged with flour. Pour into well-oiled 8-inch tin and bake at 350° F. about 30 minutes. While hot, pour over 1 cup thin cream. Serve cold with whipped cream. Cut in squares or oblongs for serving. Serves 4.

CHOCOLATE MINT ICE CREAM PUFFS

1/4 cup butter	1 tablespoon sugar
1/2 cup boiling water	1 tablespoon cocoa
1/2 cup sifted all-purpose flour	2 eggs, unbeaten
1/4 teaspoon salt	1 quart mint ice cream
	Hot fudge sauce

Add butter to boiling water; heat until butter melts. Sift together flour, salt, sugar and cocoa; add to butter mixture, all at once, stirring thoroughly. Cook, stirring, until mixture

—Photo by National Dairy Council.

Chocolate Mint Ice Cream Puffs — excellent for a dessert party—fill cream puff shells with mint ice cream and pass a dish of hot fudge sauce.

leaves sides of pan. Remove and cool a minute. Add unbeaten eggs, one at a time, beating until smooth after each addition. Drop by heaping tablespoonfuls on greased baking sheet, 2 inches apart, shaping with wet spoon into rounds. Bake in hot oven, 450° F., 10 minutes; reduce heat to 350° F., and bake 25 minutes longer until lightly browned. Cool and cut off tops. Fill with peppermint ice cream and top with hot fudge sauce. Makes 6 medium puffs.

Another delicious dessert is:

CHOCOLATE UPSIDE DOWN CAKE

1 cup flour	2 tablespoons butter
2 teaspoons baking powder	1 square unsweetened chocolate
1/2 teaspoon salt	3 tablespoons cocoa
3/4 cup sugar	2/3 cup brown sugar
1/2 cup milk	2/3 cup white sugar
1/2 cup nut meats	1 1/2 cups boiling water

Sift flour, baking powder, salt, 3/4 cup sugar and mix with 1/2 cup milk. Add the butter melted with the chocolate. Mix the cocoa, brown sugar, 2/3 cup white sugar and boiling water, and pour this mixture on the cake mixture

in pan. Sprinkle nut meats on top. Bake 45 minutes in 350° F. oven. Serves 8.

When baked, this mixture is a chocolate custard on the bottom of the cake. Cut and serve in squares, upsidown, with either whipped cream or ice cream for special occasions, although it is very good without them.

SURPRISE DESSERT

1 can well-chilled evaporated milk	1 teaspoon vanilla
1 package lemon-flavored gelatin	Juice of 1 lemon
	Vanilla wafer or graham cracker crumbs
	1/2 cup sugar

Make gelatin in regular way and when ready to set, add sugar, vanilla and lemon juice. Fold this mixture into the milk whipped till stiff.

Line a refrigerator tray with vanilla wafer or graham cracker crumbs, add the mixture and sprinkle a few crumbs over the top. Let stand several hours, then cut in squares and serve.

This makes about two quarts and tastes a bit like cheese cake, but one can't tell that canned milk is used. It is easily made, unusual and very good.

Delaware County, N. Y., FFA Wins Honors

The South Kortright, N. Y., Chapter of the Future Farmers of America recently received a Certificate of Honorable Mention in the National Chapter Contest for the 1948-49 school year. To participate in this contest a chapter must first be one of the two high ranking chapters selected each year in a similar State Chapter Contest.

Mr. Albert Palm, advisor of the South Kortright Dairy Boys, tells that the club has placed among the two state winners for the past three years and has also received honorable men-

tion in the national competition each of the three years.

This contest is based upon all of the activities of a chapter for a complete year. A chapter must submit a program of work at the beginning of the year and a summary of its accomplishments at the end of the year. These activities are grouped under the following headings: supervised farming, conduct of meetings, cooperative activities, leadership, earnings and savings, scholarship, community service, and recreation.

In the above picture Mr. R. C. S.

Sutliff, Chief of the Agricultural Education Bureau, State Education Department, at Albany, New York, is presenting the certificate to president Herbert Hait at the annual Father and Son Banquet held last year.

— A. A. —

BUSY DAYS PLANNED FOR FARM AND HOME WEEK

Visitors at Farm and Home Week at Cornell University, Ithaca, March 20 through March 24 will find something arranged for them every hour of each of the five days from 9 a.m. until 5 p.m. The program of lectures, demonstrations, motion pictures and exhibits is so varied and complete that during some hours visitors will find a choice

of from 25 to 30 topics arranged for their attention. Many topics will be repeated at different times during the program.

Among prominent speakers scheduled to appear in Bailey Hall during afternoon sessions are: Allan Kline, president of the American Farm Bureau Federation, Tuesday; and Alvin C. Eurich, president of the State University of New York, Wednesday.

BIG SQUARE DANCE

The Ag-Domecon Council, which is a student coordinating body for the New York State College of Agriculture and the New York State College of Home Economics, is sponsoring a round and square dance at Barton Hall, Thursday night, March 23. Music will be furnished by the well-known Woodhull Boys.

American Agriculturist 4-A Award Plans Changed

FOR SEVERAL years American Agriculturist Achievement Awards have been given to outstanding members of several youth organizations, presentations being made at the annual session of the New York State Grange. This year some changes in the plan are being inaugurated.

The awards for 4-H Club members (one boy and one girl) will be made at the 4-H Club Congress at the New York State College of Agriculture in June. Because the awards will be given earlier, County 4-H club agents should send applications to American Agriculturist, Savings Bank Bldg., Ithaca, N. Y. not later than May 15.

The awards for two Future Farmers

of America will be made at the FFA State Convention at Waverly in May.

The awards to two young Grangers will be made at the annual session of the New York State Grange next fall. Whereas, in the past, these awards have been made to members of the Juvenile Grange, they will be given this year to one young man and one young woman under 21 years of age who are Subordinate Grange members. Any young Granger is eligible whose 21st birthday does not occur before January 1, 1951.

It is probable that one other youth organization will be included, and announcement of the details will be made when they are completed.

WINNERS IN '49

American Agriculturist Foundation Honors 534 High School Students in Vocational Agriculture and Homemaking

THIS IS a story of youthful ambition, hard work, capability, skill, good management, and leadership on the part of 534 high school students in vocational agriculture and homemaking who, in the eyes of their teachers and principals, demonstrated special merit in their schools for the year 1948-49. All of them were recipients of American Agriculturist Foundation Achievement awards for 1949. All of them can point to accomplishments which make a firm foundation for their future, and all have evidenced leadership that demonstrates ability to get along with others and to take on responsibilities beyond ordinary classroom demands.

Take Sam Krause of Bound Brook, New Jersey, who was graduated last June from New Brunswick, N. J., High School. Not counting his 1949 crop from 17 acres of wheat and 7½ acres of corn, Sam has earned more than \$1,400 raising grain for poultry and buying eggs at wholesale to candle, pack in cartons, and sell at retail on his way to and from school. From his own work and earnings he has bought a good used tractor and a half dozen field implements, and has an equity in a combine. He participated in F.F.A. activities all through school and was president of his chapter his senior year.

Of James A. Woods of Mercer, Penn-

leader, has done outstanding work in the Future Homemakers chapter, serving as secretary and vice president.

Mrs. Freda Finnigan, teacher of homemaking at the Weare, New Hampshire, High School, said of award-winner Jane Fisk: "She is always willing to do more than her share and is often selected to lead groups. She has the respect of her classmates, and at home cooks, cans, and sews, in addition to helping her father often with

Miss Beatrice E. Neudeck (left) was graduated from West Valley, N. Y. Central School last June. She is one of the few students to win the award twice. After college she wants to teach home economics.

One of the few sophomores to win an award was Frances Schuck (right) of the Afton, N. Y. Central School. She is active in sports, Grange, 4-H, and an officer in local and state Future Homemakers of America.

Joyce Durfee (left), who won the award at the Cherry Creek, N. Y., Branch of the Pine Valley Central School, can paint, hang paper, remodel bedroom furniture. She plans a career in interior decorating.

Housecleaning, preparing family meals, baby-sitting, altering her own clothes and remodelling closets are just a few of the outside-school activities of Rita Ann Briggs (right) of Whitehall, N. Y. High School.

sylvania, Joint Consolidated School, his instructor, John D. McFate, said, "Jim is a leader the boys respect and like to follow. Because his father works on the railroad, much of the responsibility of their 256 acre farm falls on Jim's shoulders, but he finds time to star on the F.F.A. basketball team and was vice president of the chapter and on many committees. He takes an active part in church and Sabbath school work, and was on the Pennsylvania livestock judging team at Chicago in 1948." Jim owns a purebred Berkshire gilt and six head of purebred Angus cattle, and grows some corn and barley. Upon graduating last spring he went to work in partnership with his dad.

Betty Lou Sayward, winner of the homemaking award at the Willsboro, New York, Central School, considered homemaking her major subject — the one which she says "will be the most beneficial to my future life." She looks upon cooking and better nutrition as a hobby instead of a chore, and she makes many of her own clothes. Betty Lou, a capable student and a tactful

outside work. She is an ideal homemaking student."

The above are examples of just a few of the students who received American Agriculturist Achievement Award certificates and checks for five dollars at commencement exercises and Father-Son banquets last year. We only wish we had space to tell you about each and every one of the 534 winners. There are others with even greater accomplishments — boys who have built up herds or made enough money for their own college education, and girls who have applied their high school homemaking skills to earn enough to start them off on careers.

Among winners was a blind girl majoring in home economics at the New York Institute for the Education of the Blind, and a girl who has been totally deaf from birth.

These awards, first offered in 1945, go to students in agriculture and homemaking who do outstanding work,

After two years in the Army, John P. Verones returned to Williams High School, Stockbridge, Mass., and enrolled in vocational agriculture. An honor student, president of the Junior Class (1949) and a member of the student council, John received the American Agriculturist Foundation award at class night exercises.

make practical application of the knowledge gained, do well in other school work and activities, and have a community record of good citizenship. One of the most enjoyable tasks that the editors of *American Agriculturist* have is the reading of hundreds of letters and reports received from award winners and from their agricultural and homemaking teachers. Many teachers speak of the stimulating effect of the awards on the students and express their pleasure in honoring winners for their achievements.

Listed below are the names of all 1949 winners reported to us. These and thousands of other agricultural and homemaking students are being trained to assume tomorrow's responsibilities on Northeast farms and homes.

(Where there are two names from one school, the first is the winner in vocational agriculture; the second, the winner in vocational homemaking. In a later issue we will publish the names of schools where awards were made but names of winners have not been reported to us by the school.)

Kenneth Eugene Ecker (left), South Dayton Branch of the Pine Valley, N. Y., Central School, was especially pleased that he won the award as his brother, Allen Robert, won it in 1948. He is active in sports and in the F.F.A.

At the Canistota, N. Y. Central School, Burdette Mullen (right) was chosen for the award as an "all-around balanced, reliable individual with accomplishments in many activities."

Selected by the Goshen, N. Y. Central School was Benjamin Coleman (left) of Monroe, N. Y., for excellence in studies, leadership, sports, music, art work and many outside agricultural projects.

For four high school years at the Greenville, N. Y. Central Rural School, George Drummond (right) made "consistent gains toward establishing himself in farming." He also received the Empire Farmer Award in 1949.

THE YOUTH'S COMPANION

The Craigstone Meteorite

By CHARLES M. SHELDON

FOREWORD

In this amusing and touching story, a young and poverty-stricken professor tries to buy a fallen meteorite from Farmer Bent, who sets a high price on his "star" from out the sky in the hope of getting enough money to pay off the mortgage on his farm. The story is in two parts and will be concluded in our next issue.

CHAPTER I.

"Yes, my dear, it looks very pretty in the catalogue, 'Alphaeus Franklin Craigstone, Professor of Natural History (Botany), Astronomy, and Curator of the Herbarium.' If the salary were made to fit, it would look prettier to me."

"Beggars can't be choosers, Alphaeus," said the professor's cheery little wife, with an anxious wrinkle just appearing at the top of her nose.

"Beggars! My dear, when did we ever get that title? If the editor of the 'Southwestern Biologist' had paid me anything for that article on the 'Campeloma subsolidum,' which was copied in the foremost European scientific journals, we should not be so pinched for money as we are now."

"I suppose that is true, dear. It's a shame that the results of that discovery should be stolen from you. But I have great faith in your work. I know what you can do, and I will say so to the whole world."

The professor's sturdy little wife went over to her husband's side, and laid her cheek against his own. Then the professor of natural history kissed his young wife, and she went back to her work by the window while he resumed his writing.

Professor Craigstone was a young man, only two years out of college, with an enthusiasm rare even in a profession which owns many enthusiasts. He was already quoted as authority on fresh-water bivalves, thirteen new species having been reported by him. In all departments of his work he excelled, and in all his work he was sadly cramped for lack of money.

Wrayburn College was a Western institution, with more prospects than students. Its salaries were meagre, and its economy necessarily cruel.

When the professor wanted new shelves for his rare specimens of "Anodonta," the trustees passed a vote giving him leave to put them up—but appropriated no money for the enterprise; there was no money for them to appropriate. When he appealed for an assistant to catalogue and arrange his large mass of material for the herbarium, the sum voted was too small even to make a show of beginning the work.

His salary was drained every month by his living expenses, and he wore the same shabby coat to recitation-room, to church, and everywhere else.

His wife pinched and saved at every turn, wore the same dress made over, and heroically stood between the professor and bold collectors when there was no money in the house.

Her ingenuity and heroism were great. Her faith in her husband was

unlimited, and he knew it. With courage born of it he toiled almost incessantly, turning night into day, and fast growing old as he sought this way and that to add a dollar or two to his wretched income.

To make things worse, a young nephew of the professor—a graceless scamp, who had been received into the professor's house and given board and lodging—had borrowed small sums of money from time to time of the good-hearted professor. Now the youth had been expelled from the college for disgraceful conduct, and had departed without paying his debt to his uncle.

The professor's salary had been drawn one month in advance, and was already spent. There were bills from grocers, stationers, meat men. It seemed ridiculous that the foremost authority in the world on the "Phenacobius mirabilis" should be dunned for flour and potatoes. Yet that was the case, and affairs were getting desperate.

The professor scrawled nervously on the margin of a newspaper the amount of his debts, and found the appalling sum of four hundred and fifty dollars. It made him sick at heart. He did not know how he could ever pay it off. He could not ask the college to help him. Though he had paid out of his own salary more than five hundred dollars for rare specimens in natural history, he could not expect the college to return that money.

The college was glad to have the specimens, but it was quite willing the professor should pay for them and say

nothing about it.

Undoubtedly he had been imprudent to buy the specimens; but his enthusiasm had captured his judgment, and now he was suffering the consequences.

He sighed as he thought of his wife, and wondered how she had ever had the courage to marry him. He drew his pen through the figures, thus: \$450 as if he thus cancelled the amount, and strange to say, it made him feel better.

But still, there it was, and which way to turn to pay it he could not tell.

Scientific articles for newspapers do not bring large prices. "If I had only been a funny paragrapher!" said the professor to himself.

He thought of resigning and getting a situation elsewhere; but it was not a time of year when teachers are in demand, and the prospects of getting any situation at all were too small to risk losing the place he had. No, he could not think of any way out of it.

Even if he wrote for the papers every minute he could spare from his duties, he could not pay off such a sum in less than a year; and some of his creditors were getting very clamorous for money. He could not blame them. It was the disgrace of it that hurt the professor.

In despair, he rose from his table, walked across to his wife and said, with a tone of comic seriousness which was irresistible:

"Belle, lend me four hundred and fifty dollars for a few days, will you? I'll pay it back as soon as my book is finished, I will, on my honor!"

The professor's wife had a touch of

humor about her, which, with that of her husband, was their salvation when matters began to get serious. She laughed heartily at the absurdity of his demand, and together they spent the evening in calmly discussing the four hundred and fifty; but when they went to bed at twelve o'clock, the problem was as far from a solution as ever.

At breakfast next morning the professor looked at the morning paper between his sips of coffee—which almost choked him as he thought how much he owed for it—but he skimmed over the telegraphic and local news with a far-away look which showed that he was still thinking of the four hundred and fifty dollars.

Suddenly he set his coffee cup down, and grasped the paper in both hands excitedly.

"What is it?" asked his wife.

"Meteor!" said the professor. "Just listen to this: 'Last evening the occupants of a farm near Coleridge, Brown County, were startled by the appearance of a thunder-bolt, which passed out of a clear heaven close by one of the outhouses of the farm and, with a deafening report, buried itself somewhere in an adjoining field. It has not yet been discovered.'

"Those who saw it say it was a mass of solid matter, white-hot, and radiant. Parties are scouring the field to find the strange visitor from another world."

"Where is my coat?" shouted the professor. "If I run, I can catch the down-train to Coleridge."

"But, my dear, the down-train for Coleridge went an hour ago."

"Why, so it did. I had forgotten the change of time. But I can get the noon train. Belle, I'll run over and see the president, and ask him if he won't authorize me to get this meteorite for the college."

All thought of the four hundred and fifty dollars gone, nothing but his professional enthusiasm stirring in him, the professor rushed over to the president's house.

The president was a Scotchman, slow and sometimes exasperating; but he had a kindly feeling for the enthusiastic young professor, and would have pursued a more liberal policy with him if the trustees had allowed it.

The professor hurriedly stated the reason for his call.

"How much money will you want?" asked the president.

"I don't know. It depends on the people who own the farm. It is not likely that they will want much."

The president was evidently interested, but he was cautious. Finally he said, slowly, "I will advance twenty-five dollars for the college. You may go down to Coleridge and see what you can do."

"Twenty-five dollars! Why, sir, if it is any kind of a meteoric stone, it will be worth a hundred times as much."

"Well, that may be," replied the president, as complacently as if meteors were as common as new-laid eggs. "That may be. But I do not feel it advisable to advance any more. It is a good sum for a farmer to get for the stone."

"I doubt if I can do anything with that amount, but I'll go and see," said the professor with a sigh.

The middle of the afternoon found
(Continued on Opposite Page)

SLIM & SPUD

Sawdoff Sizes up the Situation

him in Coleridge. He soon discovered that the falling of the meteor had excited the neighborhood, and he had no trouble in finding the farm where the stone had fallen. It was only two miles out, and he hastily walked the distance.

As he approached the farm-house he saw a crowd of men gathered about something in the yard.

"Ah! they have found it, evidently!" said the professor to himself. He was running over in his mind the best way of getting the meteoric fragment for the little money in his possession; but when he crowded in to see the specimen, he could hardly suppress his surprise.

It was an irregular mass of a dull, grayish-looking substance. In size it was about two feet long and eighteen inches thick. It was curiously indented with little hollows, as if large drops of rain had fallen upon the surface while it was in a plastic condition, like a dish of boiling hasty-pudding, and it had then solidified, leaving the marks of the raindrops as smooth as polished wood.

The whole looked much like a mass of iron and stone partly melted and run together. But the first glance assured the professor that the specimen was very rare and valuable. He felt guilty of breaking the tenth commandment as he looked at it.

The owner of the farm was a Mr. Bent, well-to-do and shrewd. He was relating the story of the falling and the finding of the meteor, as the professor came up.

"Jim and I were just going to bed, when we heard a curious noise and I went to the door just as she"—putting his foot on the meteor—"came down. It was queer, I tell you. She whizzed by like a streak, and there was a sound like thunder. The whole place was lighted up. I told Jim something had dropped out in the lot back of the house, and we ran out and looked everywhere for it in the dark, but couldn't find anything.

"This morning we hunted around for two hours, but couldn't find it. Then I gave it up, and I hitched up the team to plow. Well, I hadn't plowed two furrows before the plow ran into something that just jerked the point off. I never knew of a stone there before so I called Jim, and we set to work to dig down, and sure enough, there was our sky-stone a foot and a half deep.

"Only this end was sticking up, so the plow point struck it. We couldn't budge it alone, and had to hitch the team on to get it here."

"How much does it weigh?" asked one of the bystanders.

"It's heavier than it looks. There ain't three men here strong enough to lift it, if they all take hold together."

Three men tried, and the dull mass remained glued to the ground, while the rest of the crowd grinned to see their efforts.

Gradually the crowd thinned out, and the professor began to hope that he would have a chance to buy the specimen quietly.

"I suppose," said he, carelessly, "that you are willing to sell this stone. I am a collector of mineral specimens. I heard of this one this morning, and came around to look at it. What is it worth to you?"

"Well, I don't know," replied the farmer, with a keen glance. "'Tain't every day a chunk of a star falls into a man's back lot. Where do you live?"

"At home, mostly," replied the professor, who thought it best not to admit how far he had come to buy the "star."

Mr. Bent laughed. "Come now, that ain't bad. But what will you give for the thing?"

The professor hesitated. If he offered the twenty-five dollars at once, he would have nothing more to give if the farmer haggled. Still he thought best, on the whole, to offer enough to get the

specimen at once.

"I'll give you twenty-five dollars for it," he said, boldly.

"It's worth more'n that."

"Twenty-five dollars is worth more to you."

"But it won't buy a piece of a star."

"A piece of a star!" But this—the professor paused as he thought of the uselessness of trying to show Mr. Bent what a meteoric fragment was.

"Come, better take the twenty-five."

"Don't know about that. Think I'll wait for a better offer."

The professor nervously walked around the specimen. The more he saw it, the more anxious he was to get it. He thought to himself, "The college surely will back me up in offering fifty dollars for such a prize. To my knowledge, no such fragment has ever before fallen in this country."

"Tell you what I'll do. I'll give you forty dollars for it. What do you say?"

"I'll think about it."

At this moment supper was called. Craigstone did not know what to do. The visitors had all gone home. The good-natured farmer saw his hesitation.

"Come on in and have a bite with us, and stay all night, and we'll talk the thing over," said Mr. Bent, who evidently enjoyed so unusual a subject. "I don't know your name, or where you hail from, but that makes no difference. Come in."

The professor accepted the invitation thankfully. At the supper table he told the farmer who he was, feeling that it would be a breach of hospitality to eat at his table on any other terms than those of the frankest understanding.

"You see the college can make use of this fragment. It is perfectly useless to you on your farm. Not worth any more to you than any other boulder."

"Do you think forty dollars a fair price for it?" asked Farmer Bent, looking at his guest keenly.

This question much embarrassed the professor. He was almost morbidly truthful. He knew that the meteor would probably sell to scientists for two or three thousand dollars.

"Well, no. Perhaps not. But it is worth much more to us than to you. And in fact I do not know how much it is worth."

"Would you give fifty dollars for it?"

"Yes."

"One hundred dollars?"

The professor lost his appetite. "One hundred dollars! Why, the president would think I was crazy," he said to himself. Aloud he said:

"The college could not afford to give that. And let me tell you, Mr. Bent, no one but some college or university will ever purchase this meteoric fragment. It would be of no use for you to try to sell to another farmer. The stone is useless to you. Come, I'll give you fifty dollars, and call it a bargain."

Farmer Bent said nothing. He was a hard customer to deal with. He rightly conjectured that the visitor from heaven was a windfall of more than ordinary value. He had a mortgage on his farm of five hundred dollars, and he was not going to let pass this opportunity to raise money on a star, as he called it.

"Well, professor, I won't give you an answer tonight. Stay over with us, and I'll tell you in the morning."

The professor passed a troubled, restless night. In the morning he was up bright and early, and went over to view the stranger from space. The more he looked at it, the more he grew convinced that it was a rare meteoric shell.

Mr. Bent came from the barnyard with the milk, and greeted the professor cheerfully. The farmer had talked over the matter with his wife. Both were shrewd New England people who had moved west in early times, and en-

dured much hardship together. They had fixed upon the sum that they would sell the specimen for.

"Well," said the professor after breakfast. "What do you say? Fifty dollars and it is a go."

"My wife and I have agreed to let the stone go at five hundred dollars. You can have it for that!"

The professor groaned. "Five hundred dollars! The college would as soon think of sending me on an expedition to the moon to pick fossilized peanuts. They will never give such a sum."

"It's worth it," said Farmer Bent, with the assurance of a veteran meteorologist.

"I must be going back then. It's no use our talking it over any longer."

But the professor suddenly stopped. An idea had come to him that almost terrified while it inspired him. He

walked back to the farmer.

"Will you give me the refusal of the stone for five hundred dollars?"

"Tell you what I'll do. If you will give four hundred and fifty dollars in cash before I have another offer for it, it's yours."

"Do you mean that you will sell the boulder to the highest bidder?"

"Of course. But if you give me the four hundred and fifty dollars before anybody else, the stone is yours."

"All right. It's a bargain. I must hurry to get the train back."

"I'll hitch up and take you in."

So the professor and the farmer parted at the station with the understanding that four hundred and fifty dollars would buy the meteorite for the professor if no one meanwhile offered a larger sum.

(To be continued)

In remodeling their farm home near Cleveland, Wisconsin, Mr. and Mrs. Ewald Olm chose *Thermopane*, for both double-hung and picture windows, to assure clear vision even in coldest winter. The large window area enables Mrs. Olm to watch all the comings and goings outdoors.

Don't let frost shut you in

*Thermopane** insulating glass in your view-framing windows puts winter on clear display. Under normal humidity conditions, steam and frost don't block your vision and make you feel shut in.

Thermopane has a blanket of dry air sealed between its two panes. This keeps the roomside surface warmer in winter, so moisture isn't drawn from the air to collect on the glass. And—you can work or sit right next to *Thermopane* windows without feeling chilly.

With *Thermopane* you save fuel, too, because the insulating air space cuts heat loss through glass. And you never have to struggle with storm sash. *Thermopane* stays in all year—actually helps keep your rooms cooler in summer. It's the easy way to insulate all the windows in your home.

- For building economy, *Thermopane* is made in over 80 standard sizes, available through glass and building supply distributors and dealers. For full details, write for our *Thermopane* book.

Kernels, Screenings and Chaff

By H. E. BARCOCK

NOW THAT my son Howard has sold out his holdings in New Mexico, and I have my own New York State farms operated by young men who give promise of making a go of their jobs, I admit to feeling a bit footloose.

For the first time in my life I have a chance to take a look at the whole country and, "on paper" at least, decide where I think are the best farming possibilities. I say "on paper" because I intend to string out as long as possible the rather enjoyable process of selecting a new place to farm.

CANADA

Were I a young man, I would take a long look at Canada. Here is a country with great possibilities. Its untapped natural resources are almost unbelievable. More important, its population—except in spots—has not yet begun to go soft. When you take the combination of great natural resources and a thrifty, hard-working people, you have exciting possibilities.

THE SOUTHWEST

The agricultural resources of this country's great Southwest are not generally appreciated. I began to notice them in the 1930's. Had anyone gone into the good agricultural sections of Texas, Arizona and New Mexico then and bought land he would have been in for a pretty good experience. His farming would have paid, and his holdings would have zoomed upward in value. To locate in the Southwest today may have advantages, but I am sure that if it is a good move now, it would have been a better move 12 or 15 years ago.

THE DEEP SOUTH

In the area east of the Mississippi and south of the Virginias the opportunities intrigue me. I think it is a great undeveloped livestock country, but the chief advantage that I see in this area is not so much the opportunity to take in plenty of money as to operate cheaply.

There is a lot of good cheap land in this section which can be made suitable for livestock. Little housing expense is required. There is a reservoir of farm help which could be made pretty good under constant supervision. More and more waste fruit and vegetable products are due to become available for cattle feed.

Finally—and this may amaze you—but last night I listened to Senator Pepper of Florida campaigning. After hearing him tell about federal aid he has gotten and is out to get for Florida, I couldn't help thinking that only a darned fool would stay up North and pay taxes to build up Florida. It would be much cheaper to move down here.

THE MIDWEST AND NORTHWEST

The Midwest, its agriculture having reached its zenith, leaves little room for pioneering. As for the Northwest, it interests me, but I probably never shall get to know it as well as I would like.

THE NORTHEAST

I've left our own Northeast to the last. You know as much about it as I do. It is the section where I have my roots. I'll always think of it as my home. I find it interesting to farm "on paper" elsewhere, but the only place where I'm sure I'll be content with both farming and living conditions is at Sunnygables—in June, that is.

THE PICTURE above was taken on the farm of a Northeast dairyman who has located in South Florida. It shows a two-year-old Brahman bull he is using on his poorer dairy cows to get calves he can raise for beef. I like this particular picture because it brings out the peculiar characteristics of the Brahman breed which enable it to do well in a hot climate. Note the long drooping ears, the pronounced dewlap and the loose wrinkled skin. These, along with sweat glands which other breeds of cattle do not possess, constitute the air cooling system of the Brahman. Since he is air-cooled, this bull will feed comfortably in hot sunshine which drives other cattle to seek shade. Note also the pronounced hump. This is the Brahman's reserve tank. Some device like this—the hump on the camel, or the big tails on sheep—is usually found on Asiatic animals which have to live

through long spells when they can get little or nothing to eat. During this period, the animals literally live off their own accumulated fat and tissues.

Finally, note the breadth of this bull's back and recognize him, too, for the efficient beef producer he is. Unlike the Brahman of rodeos, this particular bull is as friendly as a kitten. I walked right up to him (there was a stout fence between us) to take his picture. While we are not used to it and therefore don't notice it at first, the quality in this animal's eye and head is equal to that of a fine-bred Jersey. Within the next few years, I am confident, there will be a good deal of crossing of Brahman bred for milk production with dairy cows of the South. Conceivably, from these crosses may come new breeds of dairy cattle with the Brahman's ability to stand hot weather and hard going, just as beef breeds already have been developed through this cross.

WHOLE COTTON SEED

At Roswell, N. M., on February 20, 41% cottonseed meal was selling bagged at \$63 a ton from the cottonseed oil plants. On the same day, whole cottonseed was bringing \$41 a ton in bulk at the gin.

Back in the early Thirties, on a trip to the cotton growing sections of the Southwest, I ran into a similar situation, only at that time whole cottonseed was priced at \$18 a ton and cottonseed meal at around \$29 a ton. These prices did not make sense to me then, and they do not make any more sense now.

The processing of cottonseed oil is one of the tightest monopolies in the United States. For years the leaders of this industry have promoted the myth that whole cottonseed is not a good feed. The charge has even been made that the cotton oil interests in the past have succeeded in smothering experimental proof accumulated at certain agricultural experiment stations of the superior feeding quality of whole cottonseed.

Whatever may be the actual facts, not enough feeders of livestock realize that whole cottonseed can be fed straight to all livestock except hogs, in

reasonable quantities either hulled or unhulled; and that much of the time whole cottonseed, as it is today, is one of the cheapest grain feeds.

According to the 20th edition of Morrison's "Feeds and Feeding" whole cottonseed averages 23% protein, 23% fat, and only 17% fiber. By simply removing the hulls, the protein in the seed is upped to 32.8%, the fat to 34.6%, and the fiber reduced to the negligible figure of 3.1%.

It is my understanding that many nutritionists believe that fat is very important in dairy rations. How important has been lost sight of in recent years as a result of war conditions and the fact that the processors have developed their techniques until they remove practically all the fat from what we used to think of as the oil meals.

If these experts are correct, it would seem to me that one of the best buys for dairy beef rations in the country today is whole cottonseed.

Quite Palatable

In a large dairy outside of Phoenix three years ago I saw cottonseed fed by hand on top of the regular grain ration. The man who owned this dairy told me that he just couldn't make milk without the seed. He said that

after he got as much milk as he could out of his cows with a regular grain ration, he could increase their production by hand feeding cottonseed, and make money by doing so; and he pointed out to me the unusually slick appearance of his animals, for which he gave credit to the cottonseed.

I've also seen on my son's place in New Mexico the eagerness with which sheep and cattle ate cottonseed, even when it was covered with lint. And there was one sight on that farm which will always stick with me. I remember an old Dorset ewe standing between a couple of cotton rows while she contentedly ate a cotton boll. Cotton fibers stuck out on each side of her mouth as she chewed. Long ago I had begun to think of the ruminants as animals which did a great job converting grass and grain to meat and milk, but here before my eyes stood an animal actually engaged in converting cotton to wool!

I hope this little dissertation on whole cottonseed will start someone looking into the possible purchase of a supply of it for us in the Northeast. Maybe a deal cannot be made now, but it should be readied to use sometime in the future.

SERVICE BUREAU

By H. L. Cosline

EXPENSIVE MEAT BRINGS JAIL SENTENCE

ON the morning of February 13, subscriber Kenneth B. McLean of North Anson, Maine, discovered that two of his heifers had been stolen in the night. He immediately called Sheriff Martin J. Gallant. An investigation disclosed blood stains on the snow and a piece of broken glass which looked as though it might have come from a car window.

The next morning one of the McLean boys, on his way to school, saw a car with a broken window from which he thought the piece of glass might have come. He took the license number, and we called Augusta to get the owner's name. We were told that the car belonged to Paul Preble of Anson, Maine.

Sheriff Gallant searched Preble's home and found meat, but he could not prove it was from the stolen animals as the heads and hides were nowhere to be found.

Sometime later, it was discovered that Burton Seeley of Madison, Maine,

our intention to present both sides of every case, we are glad to tell you their objections.

They tell us that the particular fire extinguisher which our subscriber bought is not approved by the Fire Underwriters because it has never been submitted to them for approval. Some buyers of fire extinguishers, say Red Comet, want Fire Underwriters' approval, and for them they have types that are approved. Other people apparently do not care whether or not extinguishers are approved.

INVESTIGATE FIRST

Over a year ago a man came to this town and solicited advertising space on a curtain for the stage in our Community Hall. He gave local merchants receipts for money he collected, and promised delivery of the curtain within about four months. It has been over a year, and the curtain has never been received.

On investigating this man and the company he was representing, we found this was not a reliable outfit and that this particular fellow was recently

50-262 213	THE FIRST NATIONAL BANK OF ITHACA	Nº 3761

North Anson, Maine	<i>E. R. [Signature]</i>	

was with Preble the night of the robbery. His home was searched, and buried in Seeley's cellar were discovered the heads, hides and a halter belonging to Mr. McLean.

Burton Seeley confessed to everything. He said the heifers were taken to his home on the night of February 12 and put down in the cellar through a hole in the floor. One of them was killed that night and the other one the next morning. Preble denied having anything to do with it, but he was tried and found guilty. He is now serving a two to four year sentence at Thomaston, and Seeley is there for from one to two years.

As a result of Mr. McLean's fine work in helping to bring these criminals to justice, *American Agriculturist* was pleased to send him a reward check of \$25, reproduced above.

— A.A. —

HOW EASY?

I wanted to make a little pin money, so I sent to Wilson Ties for one of their kits for making ties. I submitted four ties to them, but none of them met their requirements; and Wilson advised me they could not use me as one of their workers. I put in a lot of time and am out \$7.50. They agreed to refund \$2.50 on the pattern.

We have never recommended home-work plans of this sort. On checking with Wilson Ties, we were advised that our subscriber's workmanship did not come up to their standards for marketable ties. Their literature stresses how simple it is to make ties, and states that no experience or special talent is necessary to become an expert fashioner of these ties. If anyone among our readers has satisfactorily completed ties for this concern and has gone on to make money doing this work, we would like to hear about it.

— A.A. —

THE OTHER SIDE

Red Comet, Inc., of Littleton, Colo., feel that our comment about their fire extinguisher in the February 4 issue was unfair. Inasmuch as it is always

arrested for obtaining money under false pretenses.

We understand there are some reliable concerns who solicit advertising of this type, but we feel our subscribers would be wise to check very carefully the credentials and reliability of anyone who approaches them to buy advertising space of this sort. A good source of information as to the reliability of such a concern is the Chamber of Commerce in the town where it is located.

4 DEAD IN CRASH!

In Head-On-Collision With Truck

Killed in this accident were Orlea May Fuller, age 15, and her brother William E. Fuller, age 12, only children of Mr. & Mrs. Win. D. Fuller of Albion, N. Y. Each of the children had a North American Accident Insurance Policy.

Also killed were two uncles Herbert and Albert Fuller—of the four killed, three had policies.

Death Benefit checks were paid as follows:

McCormick Cultivators and FARMALL Tractors

A Winning Team for Cultivating All Your Row-Crops

For Farmalls Cub (shown) and Super-A there are one-row cultivators with the tools you want for corn, cotton, soybeans, or any other wide-row crop. These are easy-on, easy-off cultivators. One bolt holds each gang to the universal mounting frame, and the one mounting frame serves for both planter and cultivator. You can cultivate up to 12 acres a day with the Farmall Cub, and from 14 to 18 acres with the Super-A.

YES, WITH A MCCORMICK CULTIVATOR on a Farmall tractor you'll be ideally equipped to win over the weeds and the weather.

Your tractor can be exactly the right size for your farm, because you can choose from five different Farmalls. Your cultivator can be exactly right for your crops and your soil, because the McCormick line is *complete*. It includes any type you need.

McCormick cultivators for Farmalls are mounted just behind the tractor front wheels, so you don't have to twist or turn to watch the gangs at work. At row-ends and grassed waterways you raise or lower the gangs with a fingertip touch of your Farmall hydraulic control system. No slowing, no stopping. And with the gangs raised, the entire outfit "turns on a dime."

You'll be equipped to get your cultivating done *right*, and on *time*, if you have a McCormick cultivator and a dependable Farmall tractor. And now's a good time to talk to your International Harvester dealer about it.

For Farmall M there's a McCormick four-row cultivator that will let you work 60 acres a day. Uneven ground is no problem: each gang floats freely up and down, and self-cleaning gauge wheels keep the gangs from working too deep. Hydraulic Farmall Lift-All gives *automatic* delayed action of rear sections, so that they enter and leave the ground where front sections do.

For Farmalls C (pictured), H, and M there are two-row cultivators with all the McCormick advantages. Cross-cultivating check-row corn is easy because you can see the gangs at work ahead of you... slip around an occasional out-of-line plant by giving the Farmall steering wheel a slight turn. You'll breeze through 30 acres a day with a Farmall-mounted two-row cultivator.

See your IH dealer for IH 5-Star Service... better five ways for getting your farm machines ready for the work ahead.

THE FARM PAPER OF THE NORTHEAST

NORTHEAST FARMS GET

High Yields of Feed Grains

By George Serviss

THIS YEAR the northeastern dairy farmer is face to face with lower milk prices and continued support prices on western feed grains. This makes it attractive to farm for high yield crops up to the point at least that the resulting crops can be fed on the farm. We doubt if for the long pull it will be profitable to produce feed grains on a cash crop basis as a major enterprise in most sections of the Northeast. There will, no doubt, be exceptions to this statement as a result of local conditions. High support prices in the corn belt on feed grains will, though, temporarily at least, result in increased acreage of feed grains in some sections.

If you go to the expense of plowing, fitting the land, buying seed, planting, and perhaps cultivating, it is good business to fertilize for high yields. Fertilizer is today the cheapest major production commodity that farmers buy. Compared to pre-war, the farmer's fertilizer dollar is worth 67 cents, his feed dollar 50 cents, his machinery dollar 40 cents and his farm labor dollar 27 cents. These figures clearly indicate that so long as good response is obtained from fertilizer it pays to use it. Deciding at just what rate to stop is the problem, not whether or not to use it.

If one examines the fertilizer recommendations of the various agricultural colleges in the Northeast, and compares them with the recommendations of the late 1930's, he will note quite a change. These changes in recommendations are based on first, a build-up of phosphorus on farms that have used phosphatic fertilizers heavily over a period of years; second, research indicating a larger place for nitrogen and potash in a fertilization program than was thought at one time to be the case; third, the desirability of higher acre yields in view of changing economic conditions; and fourth, the introduction of new varieties of practices that will produce these high acre yields.

Changes in Recommendations

First let's discuss the build-up of phosphorus that has taken place on many farms. Northeastern soils are generally deficient in phosphorus and it was certainly sound to emphasize the use of phosphorus after the lime needs of a soil were taken care of in order to grow legumes. Phosphorus, though, has been applied on many farms in excess of the quantities removed by crops, and since it does not leach, we now have quite an accumulation

of fertilizer phosphorus on many farms. This phosphorus is not as readily available as freshly applied fertilizer phosphorus, but is of value. Its presence does not mean that phosphorus can be dispensed with in the fertilizer program, but it does mean that more consideration can be given to nitrogen and potash than has been the case. This has led to less emphasis in fertilizer recommendations on straight superphosphate, except for reinforcing manure, and on such analyses as 4-16-4, 4-12-4 and 3-12-6. Much more emphasis, though, is being placed on analyses that contain more nitrogen or potash or both in proportion to phosphoric acid. Such analyses are 10-10-10, 8-12-12, 5-10-10 and 6-12-6. It should be remembered that there are many farms that have not used phosphatic fertilizers heavily enough to result in any appreciable build-up and that a good proportion of dairymen do not yet regularly reinforce stable manure with superphosphate.

The hybrid corns grown today yield more than the open pollinated corns grown in the thirties. In order to yield more, they must extract more plant food from the soil. Sooner or later this means heavier use of fertilizer if these higher yields are to be maintained. It does not mean that a yield of 75 bushels per acre of shelled hybrid corn is any harder on the land than 75 bushels of open-pollinated. To get the yield, the plant food must be there from one source or another. Somewhat heavier planting rates for grain corn are now being recommended and these heavier rates result in higher yields providing the necessary fertility is there.

With oats we have a similar picture. Today's oats of the Clinton and

(Continued
Page 12)

Continuing high support prices ■ Western feed grains despite lower milk prices make home grown grains more important than ever to Northeast dairymen. Hybrid varieties and ample fertilization are bringing yields that rival those of the so-called corn states.

Before...

This eight-week-old pullet is at the dividing line in her growth. She has multiplied her weight 16 times since hatched. The feed—G.L.F. Chick Starter alone for six weeks with grain added for the last two weeks.

after...

From here to the first Egg, she goes on G.L.F. Growing Mash and Scratch Grain. Her growth now will be more gradual—she does not need quite as much of the costly minerals, vitamins and proteins.

This feeding system is used by more Northeastern poultrymen than any other method of raising pullets.

The plan outlined here—G.L.F. Chick Starter for the first eight weeks, G.L.F. Growing Mash to egg-laying maturity—has proven practical, economical and successful on thousands of farms.

G.L.F. chick mashes have the right amounts of everything science and experience says is needed by growing birds.

These mashes are manufactured by precision machinery from choice ingredients and shipped fresh daily to your own community. This farmer-owned system works so well that last year 17 million chicks were raised on G.L.F. feeds.

Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

G.L.F. Growing Mash

From Eight Weeks to the First Egg

PASTURE FOR PIGS

By John P. Willman

EFFICIENT and economical pork production should be the goal of every swine breeder or feeder. The use of pasture will aid greatly in reaching this goal because the use of pasture saves feed and is good insurance against losses due to deficiencies in the rations for swine of all ages. Swine that are given access to good pasture require less of the higher priced feeds, such as the protein concentrates, than are needed for pigs that are fed in dry lot. An acre of good pasture has a value equal to 1000 pounds or more of hog ration.

Kind of Pasture

Alfalfa, clover, or mixtures of these and timothy are good swine pastures. Dwarf Essex rape seed sown at the rate of 8 or 10 pounds per acre on well-fitted, fertile soil provides a palatable pasture for swine. Some pork producers prefer to sow a mixture of 6 pounds of rape and from one-half to one bushel of oats per acre. Rape or rape and oats may be sown in late April or in May and with favorable growing conditions is ready for use about eight weeks later. An acre of this or other good pasture crops is sufficient for 15 to 20 full-fed pigs from about weaning time until they reach market weight. The same amount of pasture will provide enough forage for 5 to 8 brood sows or gilts.

Early fall sown rye, wheat, or rye, wheat and vetch are excellent for sows and litters from early in the spring until the pigs reach weaning age. An acre of this type of pasture is enough for 10 or 12 sows and their suckling pigs. The pigs that are given access to pastures of this sort are more healthy and vigorous than those that are raised

in the barn or on old hog lots.

If pasture areas are limited it will pay to provide pasture first, for the boars, brood sows, and gilts in the breeding herd and second, for the pigs under 100 or 125 pounds live weight.

Pasture Fences

Permanent swine pastures for open or bred sows and gilts should be fenced with woven wire. A 32-inch woven wire fence with the vertical or stay-wires 6 inches apart and with a barbed wire above is one of the best. It may be too costly in many cases to use this type of fence for less permanent pasture areas. A properly built electric fence is excellent for these areas. Two strands of smooth galvanized wire, one wire about 10 or 12 inches from the ground and another about 20 to 24 inches above the ground, if properly installed, should give good results. This type of fence has been used at Cornell University for several years with a fence controller operated with dry-cell batteries. The weeds and grass must be kept cut or burned beneath these wires. The pigs soon make a bare path near the fence and they require a great deal of urging to go across this path even though the current is turned off temporarily. Well-fed pigs are easier to confine with any kind of fence than pigs that are hungry much of the time.

Now is the time to plan pastures for profitable pork production. The use of good, clean pastures saves feed, produces healthier pigs, and promotes sanitation. Bred sows and gilts that have been given access to pasture during the gestation period produce stronger pigs than sows that are confined to the dry-lot. The fencing problem should not be too difficult for well-fed swine.

FARMER READER SAYS:

"We Must Do Something About Markets Ourselves"

THE FOLLOWING letter from Harold S. Wright of Pawling, N. Y., evidences some real, constructive thinking about the present marketing situation, especially for milk. *American Agriculturist* editors would like to know what you think of Mr. Wright's ideas.

"We farmers through our various Marketing Agencies, Extension Service, State Conference Boards, etc., must arrive at a cool and accurate appraisal of conditions in our markets, and take definite, concerted action to do something about it *ourselves*, instead of setting up a cry and hue for our government to do it for us.

"In both Connecticut and the New York Market, the supply in the fall of 1949 was 25% in excess of that of 1948. More milk per dairy and more dairies contributing to the market. Why? Good weather and feed conditions probably, coupled with a prolonged period of attractive prices. Demand has fallen a little but not to a great degree.

"What can be done about it?

"Every agency connected with the industry in any way should develop a practical plan of control at the source, with perhaps something of the following nature.

1. Raise the butterfat percentage of milk in all markets by approved methods such as are commonly known.

2. Every farmer has a few cows which are boarders, not economical producers. Cull them or dry them off, and don't replace with fresh cows but replace with heifers or cows to come into production at a later date to balance production.

3. Reduce the ratio of grain feeding so that more home grown roughage will be consumed, a little less milk pro-

duced but at a lower cost per hundred.

4. Plan a revamped crop program which will include some corn for grain or some other form of home raised grain. A little less milk made, but costs can be lowered with the new oats varieties yielding 70-75 bushels and hybrid corn 100 bushels, and with grass for silage furnishing the necessary succulence.

"Shout this message to the high heavens by every known means and then, if possible, *reduce* the price of Class I fluid if necessary to maintain volume consumption. In spite of all government support programs at the tremendous cost to the taxpayer, the law of supply and demand still rules the roost, as we will find out all the quicker if the Brannan Plan should come into being, *because of the tremendous cost*. Remember the consumer is in the majority and he is getting fed up with artificially supported prices.

"It is the obligation of our farm leaders, our marketing organizations, and all other agencies, to recognize the facts and leave no stone unturned to develop a sensible and practical program, and then put it into action.

"The common practice heretofore when faced with declining markets is for the farmer to increase his production on the premise that his costs can't be cut and that he must maintain his present income. Result: an aggravated farmer-made surplus condition and an accelerated price decline.

"The suggested items above may not be entirely correct but the importance of this phase of agriculture can, in my opinion, be rated as of No. 1 Priority and all guns should be turned on it."

—Harold S. Wright, Pawling, N. Y.

MILK PRICE WAR SHOULD STOP

DR. LELAND SPENCER of Cornell, nation-wide authority on milk marketing, told a New York State Farmers' Week audience last week that the milk price war which has been raging in New York City since last October is almost certain to have very serious consequences both to farmers and consumers.

The war came out in the open on October 13, when one of the largest milk distributing companies reduced the price of milk from 1½ to 2½ cents a quart. Other dealers immediately followed with a similar reduction. Now it is a known fact that the dealers' profit on fluid milk is less than 1 cent a quart. In some cases it is only a few mills. That means that the reduced prices are causing heavy losses to every dealer. Consumers benefit only temporarily from this price cutting, for the resulting chaos in the milk market will bring about higher prices than ever when the dealers who survive the fight try to make up their losses. Furthermore, the losses incurred by this price cutting, if continued, will surely find hundreds of smaller dealers out of business, thereby decreasing the competition which safeguards the consumer against monopoly.

To dairy farmers the consequences of this price war are even more serious. For example, all premiums paid by some of the dealers to farmers have been discontinued, or will be. Handling charges for cooperatives have been reduced, or are being drastically cut. This will result in reduced prices to members of cooperatives. And of course this price war will cause all kinds of pressure on farmers and their dairy marketing cooperatives to reduce farmers' prices.

Much of this price cutting problem stems from the almost constant war that goes on between those who sell milk out of stores and the dealers who distribute it to homes. Mixed into the complex situation also is a war between the advertised brands and the non-advertised. The larger dealers, who mostly sell the advertised brands from house to house, often have to cut their prices to meet prices set by those who sell unadvertised brands of milk. That situation has frequently started price wars.

Some of the responsibility for this disastrous situation in the milk business in New York City rests upon the New York City Administration, which started a demagogic campaign to convince consumers that milk prices were too high and that dealers were getting rich. Acting under this pressure from the City administration, some of the chain stores cut their profits and reduced the price of milk sold in their stores. This put the dealers who sell the advertised brands and other dealers on the spot, and undoubtedly was one reason why the price war started.

In any case, this price cutting is particularly unfortunate now when farmers are plagued by a large surplus of milk and when there has been little or no reduction in the cost of producing milk. It is high time that state and national authorities took note of the situation and steps to correct it. Under the New York State Milk Law the Commissioner of Agriculture has authority to act. So does the U. S. Secretary of Agriculture, who could re-write the New York milk shed order to include authority to control unfair practices in milk marketing. The Federal Trade Commission also could act immediately to put a stop to unfair trade practices. It is for situations just like this that the Federal Trade Commission is supposed to exist.

GOOD PROPERTY

DURING THE next few weeks, the Dairymen's League Cooperative Association will distribute nearly three million dollars worth of certificates of indebtedness to League members, to cover the fiscal year which ends March 31.

I well remember how this revolving method of financing League operations was bitterly opposed by many when it was first started. Yet over the years there have been few investments that dairymen could make that would have paid out better

By E. R. Eastman

than these certificates. They bear 4% interest, payable annually, and they have always been paid off when due or before. They may be used as collateral at banks, and conservative investors prize them. This method of financing League operations with the members' own money has proved highly successful.

IT'S STILL QUITE A CHORE

RIDING ACROSS a great dairy section of the Northeast in the middle of March, when a heavy blanket of snow covered the ground, I was interested and amused to see the patterns or pictures laid upon the snow by the manure spreaders. There were at least a dozen examples, where someone had tried to get a little gay and spread the manure in great circles or in figure eights, etc.

The total amount of manure that is spread on dairy farms every day in all kinds of weather is immense. As I looked at the evidence of the large amount of work involved even with the help of manure spreaders and barn cleaners, I thought how this dairy chore had changed since I was a boy. Then all of the pitching and spreading had to be done by hand. Frequently it was impossible to get into the fields during the winter, so the manure was piled up in the barnyard and a large part of it was wasted. Ever try to pitch manure when it was frozen and reinforced with old cornstalks?

The boys of a generation ago didn't drive the manure wagons and spread the manure in circles or in any other designs. They were just interested in dumping the darn stuff off the wagon or sleigh and getting back to the barn! Sometimes they had some fun, though. I knew one boy who got the bright idea of backing a horse against a pile of frozen manure and tickling her belly with a stick so that she would kick the frozen manure loose. Only trouble, the boy's dad caught him at it and the fun abruptly ended with the application of the same stick to the boy!

Not only have we found ways of spreading the manure easier, but the tractor and spreader have made it possible to get it back onto the fields that need it most—those farthest from the barn. We have learned how to balance the plant food and manure with superphosphate, and now we are learning that with many crops and on many soils we can profitably use more nitrogen and potash. Farmers of the United States are using far more commercial fertilizers even where they have farm manure than they ever have before, and making this increased use pay good dividends.

SOME GARDEN DECISIONS

IT HAS always seemed to me that the object of making a living is to live well. Therefore, I have never been able to see why many farm families don't give more consideration to the quality of their food. Relatively few milk producers use enough of their own product; only a few farmers grow their own meat; and were it not for the farm women there wouldn't be many farm gardens.

I am speaking from my own many years of experience when I say that these home-grown products pay in dollars and cents, and, what is far more important, they pay in much better living for the farm family. So many times I have heard farmers say, "I can buy it cheaper than I can raise it." But I know that you cannot buy meat like we have in our freezer from our fat Herefords; I know that the wilted, second-rate stuff that you often get from a grocery store is not to be compared in quality with the garden products and small fruits which we grow and eat not only during the season but have fresh from the freezer the year round. For example, you wouldn't have been able to tell any difference between the strawberry shortcake we had last night for supper and one made in June.

This year, prices of the stuff farmers sell are down, and, unfortunately, will be lower. But if we plan right, we can live just as well as we did when prices were higher. But it will take some planning,

and the time to plan a garden is right now.

Part of that garden planning is based upon saving work. Few men will work all day in the field and do a lot of hand work in the garden after supper. But we plow and fit our big gardens with a tractor and field equipment, and we cultivate them with the tractor. Some use garden tractors. Last year we had bushels of peas by sowing them broadcast and never touched them after sowing except to pick and freeze them. This year we will do the same with some of the small things like radish and lettuce. If the land is well fitted the small stuff will grow broadcast in spite of the weeds.

Of course, I am talking about the farm garden, where land is cheap and plentiful. Villagers with a little land and little equipment will have to do the work by hand. But even then, a good garden pays.

OPPORTUNITY KNOCKS BUT ONCE A YEAR

FASTER THAN most of us realize, changes and improvements have come about in farm practice even in the last five years. Some of these are now essential on every farm if we are to continue in business, and the decision as to whether or not you are going to use them in most cases has to be made in the next few weeks. Here are some of these changes:

PASTURE IMPROVEMENT

It is now possible to extend the length of the pasture season in both spring and fall and to keep the pastures good during the dry months of July and August. Are you going to do anything about pasture improvement this year?

LEGUMES AND BETTER HAY

We know a lot more about quality hay than we did even a short time ago. Are your grass seed mixtures for this year up to date? Will you cut your hay early this year? And how will you harvest it?

GRASS SILAGE

This practice, which has come about mostly within five years, has probably done more to increase milk production and cut down costs than any other one factor.

EATING AT THE FIRST TABLE

Prices for farm products are going down, but with a garden and a freezer, home-grown meats, vegetables and berries, and more milk and eggs on your own table, your family can still live as well as ever, and better than most.

HOME IMPROVEMENTS

The house is where we have to live most of the time. Paper and paint, and maybe a little remodeling, can add a lot to the happiness of yourself and your family.

GREAT STUFF

EAST OF OUR house is a five or six-acre meadow which I seeded four years ago with a good hay mixture, including a small amount of alfalfa. Gradually the alfalfa has crowded out everything else so that for the last two years we have cut from 2 to 3 tons per acre of alfalfa hay from that piece, in two or three cuttings. It is the most satisfactory hay crop I have ever had.

The meadow is like a great lawn, the first thing around us that is green in the spring, and the last thing in the fall. Right through the drought of last summer, which was the worst I can remember, that alfalfa never stopped growing for a day.

On farms where it will grow, there is no grass or legume that can beat alfalfa either from a production or a feeding standpoint.

EASTMAN'S CHESTNUT

OH, WHAT a strange looking cow," exclaimed the sweet young thing from the city. "But why hasn't she any horns?"

"Well, you see," explained the farmer, "some cows are born without horns and never had any, and others shed theirs, and some we dehorn and some breeds ain't supposed to have horns at all. There's a lot of reasons why some cows ain't got horns, but the reason why that cow ain't got horns is because she ain't a cow, she's a horse!"

AA's Farmers' Dollar Guide

BUSINESS OUTLOOK: Recent predictions by economists indicate the probability of continued business at about present levels during 1950. One of chief needs of country is lower taxes and a balanced budget. Congressmen are showing a disposition to guard the purse-strings. Representative Wadsworth of Geneseo, N. Y., recently declared he would be "stubborn" and would vote for no appropriation that was not absolutely essential. Others have joined him and "stubborn" may become word of high praise for legislators. **This is no time to embark on new, costly, socialistic experiments, no matter how admirable the goals.**

WORRIES: Washington bureaucrats are worrying about long-range job prospects, claiming that industry has not expanded to serve increased population and give jobs to growing army of workers. Therefore, bureaucrats will scold business, threaten business, and finally demand legislation to encourage or force business to expand, with actual taking over of some segments of business by government as final goal of "planners." **Worry is based on misconception that government should be responsible for all things, including jobs for its citizens.**

PRICE SUPPORTS: History of price supports is one of steady increase in support levels and continuous addition of crops eligible to support. Politics are becoming more and more evident in these supports. Particularly in election years (and no matter how essential the need), congressmen squirm at reducing support levels or tightening acreage controls. Recently Congress passed legislation to compel increase in cotton, wheat and peanut acreages above those set by the USDA. **Result will be added surpluses, added tax dollars to support prices.**

At present, value of price-supported products owned by Commodity Credit Corporation, or on which it has loaned money, totals \$4,000,000,000 including: cotton, \$1,012,663,736; wheat, \$1,011,791,572; corn, \$880,651,070; tobacco, \$150,695,354; linseed oil, \$116,649,787; flaxseed, \$84,987,974; dried eggs, \$98,116,167; butter, \$62,434,199; wool, \$40,140,430; dry beans, \$43,078,689; barley, \$35,024,655; and dried milk, \$35,024,655. Storage charges on products owned and for which there is no visible market amount to about \$500,000 a day.

We keep hammering at these facts only because we feel certain that in the long run the present situation, if allowed to continue, will be bad for all agriculture and particularly for our readers in the Northeast.

MILK AND EGGS: U. S. MILK production in February was a record high for the month—8.7 billion pounds, 3% more than a year ago and 6% above the 1939-48 average. But the figure is misleading. In studying production figures, never forget that population is increasing rapidly. **ON A PER CAPITA BASIS, FEBRUARY MILK PRODUCTION WAS NEAR THE LOWEST POINT IN TEN YEARS.**

The CCC acquired more than 100 million pounds of butter in its 1949 support operations, for which there is no visible market. Butter production is running 10% over last year, and the 1950 support price is actually 1 cent higher than last year.

February EGG production was 8% above February last year and 22% above the 1939-48 average; reasons, 6% more hens, 2% heavier production per hen. Price supports 10 cents per doz. lower than last year have been costing about 5 million dollars a month, and, so say the experts, cost is due to jump sharply in April, May and June.

The Commodity Credit Corporation owns 73 million pounds of dried eggs, equal to 1½ doz. eggs for every person in the country, yet is buying twice as many dried eggs as it did a year ago.

CROPS: U. S. DRY BEAN acreage goal for 1950 has been reduced by 20.4%. Individual farmers will get allotments soon. Price supports countrywide for all varieties, averaging \$6.30 a hundred, are available only to those who plant within allotments.

In New York processors plan to contract 34,000 acres of PEAS FOR CANNING, 4% less than last year. For U. S. the prospect is for an increase of 1%.

Prospective 1950 ONION acreage in late summer states is 65,980 compared to 61,650 last year. In New York prospect is for 15,000 acres, 3% above last year.

—H. L. Cosline.

The Song of the Lazy Farmer

MY NEIGHBOR'S nervous as can be, he acts as jumpy as a flea, 'cause at this time in ev'ry year he's overcome with dread and fear that luck's run out and ev'rything is bound to go all wrong this spring. He's sure that either snow or rain will mean he can not plant his grain and when it's harvest time next fall he won't have any crop at all. He gets up at the crack of dawn and never even stops to yawn before he's over to my place, with worried look upon his face, to say, "It looks like snow some more, spring's never been this late before."

Then he starts pacin' up and down, his brow all furrowed in a frown, and when I try to make him set and talk 'bout something to forget, he shakes his head and wonders why the overcast and threat'ning sky don't get me all excited, too, and asks, "Whatever will we do?" I claim that question's sillier than askin' which came earlier, the chicken or the egg, 'cause we can't do a single thing, by gee. So I'll just count it fortunate because a late spring will mean that I've got more time to save my strength and give my life some added length.

which came earlier, the chicken or the egg, 'cause we can't do a single thing, by gee. So I'll just count it fortunate because a late spring will mean that I've got more time to save my strength and give my life some added length.

Make all your crops pay DUST and SPRAY the IRON AGE WAY

Here's why you get more coverage at lower cost with IRON AGE

LISTEN to what users say about spraying the Iron Age way: "Sprayed over 155 acres the full season without putting a wrench to my pump" ... "Iron Age saves me money because I never have any pump trouble" ... "Get better coverage with Iron Age than any other sprayer I've seen" ... Iron Age performance pays off, because Iron Age builds sprayers in sizes and capacities to meet every orchard, grove or row crop grower's demand for a machine that delivers maximum coverage with low upkeep. The famous Iron Age Pump maintains high pressures needed, and still takes a beating season after season without breakdowns. See your Iron Age dealer about the model you need to make your crops pay off with greater yields and bigger profits! Or mail the coupon for complete details on the Farquhar Iron Age Line.

IRON AGE HIGH VELOCITY DUSTERS built in all capacities and sizes to meet your crop protection needs. High velocity blower is designed for accurate dust feed. Operates normally at 3700 RPM. Levers permitting boom control from tractor seat eliminate nozzle drag.

School District Centralization

Good or Bad?

By FRANCIS T. SPAULDING

Commissioner of Education for the State of New York

EVERY YEAR, on the advice of members of the Education Department, the Commissioner of Education must come to some definite conclusion as to whether to provide for local votes on the inclusion of scores of common school districts in new central districts. The problem of school district centralization is important to thousands of voters and thousands of children.

Eighty Per Cent Centralized

Most citizens seem to have agreed a long time ago that centralization is an excellent idea. The local votes on the centralizations that have been recently laid out show a majority opinion. For example, I have checked the voting figures for the 103 centralizations most recently voted on. The total number of votes cast was approximately 77,000. More than 55,000 votes were in favor of the proposed centralizations; less than 22,000 were against them. Out of these 103 proposed centralizations, 99 were approved by local majorities on the first vote; two more were disapproved at first and then reconsidered and approved at special meetings later; and only two have been voted down and not subsequently approved.

If one bears in mind the somewhat uncertain fate of propositions submitted to local referendums, one must grant, I think, that this record of votes on school-district centralizations represents an extraordinary batting average. The public opinion lying behind these votes has brought us to the point of centralizations now established in New York State—384 central school districts, composed of more than 5,500 former common school districts and several hundred union free school districts, and including nearly 80% of the State's area qualified for centralization.

Why Centralize

Much of what centralization has meant is clear to anyone who drives through countless areas in up-state New York. These central schools have buildings that any community can be proud of, with equipment that allows not just teaching out of books but first-hand experience in music and art, agriculture and industrial arts, science and homemaking, dramatics, school clubs, and physical sports, in surroundings that are clean, healthful and attractive, with teachers selected to do the work they can do best and given the kind of supervision and teaching programs which enable them to do that work. Beyond these educational changes centralization has brought with it other changes as well: the improvement of country highways, the growing inter-

est of rural people in the new kinds of community activities which their central schools make possible, the greater neighborliness of people over wide areas. It is because of what school district centralization has meant, in these terms, that year after year the numbers of our centralized schools have continued to grow.

Objections to Centralization

Though public opinion in general strongly supports centralization, various objections to it have been raised. The people who put forth these objections are practically always minority groups, because a majority which is opposed to a proposed centralization does not have to state or defend its position; it has only to vote the proposal down, if and when a vote is required. But the fact that the objections come from a minority of the voters certainly does not mean that

Without central schools, thousands of boys would be denied the opportunity of studying vocational agriculture.

they do not deserve thoughtful consideration.

One of the earliest objections to school-district centralization and one which is still occasionally put forth, is that the central-district organization will do away with the little red school house. My only comment is that this is exactly what central district organization is intended to do. To judge whether the results are good or bad, one need only compare the programs of the central schools with the programs of the schools they have displaced. Of course, there were and are many good one-room schools with splendid teachers. In their time they made a great contribution. The horse and buggy were good for their time, also, but few would wish to return to this means of transportation.

A second objection (and this is one more commonly heard at the present time) is that centralization will take away from the people in the common school districts the control of their schools to which the principle of home rule entitles them. To judge how valid this objection may be in connection with any particular centralization, one must know how much control the people in the common school districts now have over their schools. Let me explain:

Many Have No Voice

Any single proposed centralization may include some common school districts which literally have no pupils. Because of shifts in population or the moving of young people away from the community these districts have no children of school age. Except through centralization, they would have no schools over which to exercise any control.

Furthermore, more than half the common school districts included in the average centralization proposal are districts which contract with neighboring school systems for the education of all their children. Neither do the people in these districts exercise any present control over their schools, apart from their choice of the school districts from which they will "buy" their children's education.

Finally, none of the common school districts included in any proposed centralization exercise control over the education of high school pupils, beyond designating the high schools to which it will pay tuition. The arrangements for high school education are always on what amounts to a contract basis with neighboring schools.

So far as home rule is concerned, what centralization does for the com-

mon school districts is to give them a voice in determining educational policy for all their children, from kindergarten through high school. It does so in part by providing that through their votes they shall have direct representation on the central district boards of education. It is fair to say that in most centralizations one important gain is greater control by the people in the common school districts, rather than less control, over the whole period of their children's elementary and secondary education.

A third objection often raised by those opposing centralization is that centralization may force two neighboring communities which have habitually had little or nothing to do with each other to work together in providing an educational program for all their children. Sometimes the objection grows out of long-existent and deep-seated rivalry between two communities.

In no part of our democracy have we yet discovered any sure formula for keeping a determined minority from frustrating the will of the majority if it is bent on doing so. One may question whether the fact that school centralization makes necessary cooperation between groups which do not wish to work together is a valid objection to centralization, any more than it is a valid objection to democracy.

Cost More, Worth More

A further objection is that centralized schools cost more than common schools, and in particular that centralization will increase the tax rates in

certain school districts without appreciably lowering the tax rates in others.

To the best of my knowledge, there has been no contention on the part of any responsible person from the beginning of the centralization movement in New York State, that centralized schools will be cheaper than the common schools which they displace, in terms of dollars actually spent. The fact that they are not expected to be cheaper has been recognized over the years in provisions by the Legislature for special additional State aid to centralized schools. The position of those who have favored centralization has been that, for the money spent on them, central schools can provide a better education for rural boys and girls than can be provided at the same cost by any collection of one and two-room rural schools, or of such schools combined with the schools in union free school districts.

As to the districts which object to centralization because their own tax rates will go up out of proportion to the general increase in local taxes which the centralization may impose, it should be noted that part of the purpose of centralization is to extend more broadly the local tax base for the support of education. If this purpose is to be achieved, districts which in the past have borne less than their share of the cost of education in the area in which they are situated can properly be expected to assume a share equal to that of their neighbors in the area covered by the centralization.

Why Not Vote by Districts?

Another objection of opponents of centralization is to the statutory provision under which the final decision to accept or reject a centralization laid out by the Commissioner of Education is determined by the total number of votes cast in the districts to be centralized, and not by separate tabulations of the votes in the separate districts.

The New York State law governing school-district consolidations, which was in effect long before the Central School Law was passed and is still in effect, clearly illustrates what would happen if the Central School Law provided for district-by-district votes on centralization. The law governing consolidations provides that a negative vote by any one district terminates the proceedings and continues all districts in their nonconsolidated status. If voters could vote by districts, it would result in a practically complete blocking of many school district reorganizations. Common school districts which hoped to get their high school pupils educated at low cost to themselves through contracts with other districts — sometimes, even, through

(Continued on Page 26)

You make better
quality hay... faster...
with a smaller crew... the *McCormick* way

Win the race against weather. Mow 4 acres an hour with the McCormick semi-mounted tractor mower. Among its many advantages are V-belt drive for trouble-free, smooth operation; easy square corners without knocking down hay; safety cutterbar breakaway to prevent damage; and optional hydraulic lift. It fits most tractors. Attached to the drawbar in minutes.

The tractor driver is the baling crew with a McCormick heavy-duty, engine-driven, pickup baler. This all-automatic machine bales up to 6 tons an hour, and is available for either twine or wire tie. Fast, yet mighty gentle, it seals the precious leaves into snugly-tied bales. Built for large acreage and constant custom operation. Handles heavy windrows smoothly.

Mowing is made easy when your Farmall tractor is equipped with its own quick-attached mounted mower. Easy to back and turn, easy to get into tight corners; all the features and speed of the semi-mounted mower above. McCormick A-21, C-21, A-24; and HM-24 mowers have hydraulic lift.

Family-sized farm baler. The McCormick power take-off operated, all-automatic baler is ideal for baling your own hay. No risky delays—start to bale the moment your hay is cured to finest quality. Bale 5 tons an hour, all by yourself. A Farmall H or equivalent tractor will power this machine.

You save the precious leaves, yet rake at fast speeds, with the McCormick heavy-duty, 8-foot side rake. Ground driven, it's never out of time—makes uniform windrows no matter how you vary the tractor speed.

Protein-rich cured hay or grass silage—full of vitamin A—is easier to make with a McCormick hay chopper. It picks up the crop from the windrow, chops it into pre-selected lengths, blows it into a trailing box or truck.

INTERNATIONAL HARVESTER

See your IH dealer for IH 5-Star SERVICE for all your farm machines... the year around!

GET THESE FREE BOOKLETS

All the McCormick hay machines shown above, and many others, are described in colorful, fully illustrated booklets. To learn more about the equipment you need, mail the coupon below. No obligation, of course.

Farmers Outnumbered by City Consumers...

Our Best Farm Program Lies in Cooperative Self-Help

More than four out of every five people in America live in towns, and work at something other than farming. We farmers are thoroughly outnumbered—a minority both on the census rolls and on the voting lists.

Our greatest hope for a prosperous agriculture lies in cooperative action among ourselves rather than in any form of price subsidy or government help.

Government Listens to the Greatest Number

Any government is going to be more sensitive to the demands of the four-fifths of the voters who live in towns than it is to the demand of the one-fifth who live on farms. Hence, in the long run, government control will surely tend to fix farm prices at a lower level than they naturally would bring in an open market. Price subsidies of any kind are only a temporary stop-gap for the farmer. Over the years, they can only bring him higher taxes, government limitation of acreage and production, and loss of freedom of action in running his own farm.

Farmers Themselves are Confused and Divided

Unfortunately there have been so many claims and counterclaims by interested groups that we farmers ourselves hold divided opinions as to what is best for our own welfare.

We should stop and consider—every one of us—how much good has come to all of us through the cooperative action of the Dairymen's League. If the 26,000 dairy farmers in the League can accomplish so much good, both for members and non-members alike, what couldn't be done if all dairy farmers got together and pooled their efforts in an attempt to maintain fair prices, equality of opportunity, and freedom of the individual farmer to live his own life in his own way.

The cooperative way is the only way by which we outnumbered farmers can make our voices heard, and our rights respected.

DAIRYMEN'S LEAGUE

Cooperative
ASSOCIATION, INC.

Ayrshire Breeders Plan Diamond Jubilee in May

A RECORD-BREAKING attendance of approximately 600 Ayrshire breeders is expected at the annual meeting and sale in Syracuse, N. Y., May 5 and 6 to celebrate the 75th anniversary of the founding of the Ayrshire Breeders Association. The meeting will be Friday, May 5, in the Onondaga Hotel, where new officers will be elected and the policies of the A.B.A. will be reviewed.

The Ayrshire Diamond Jubilee sale, (Saturday, May 6, at 10:30 a.m.), is being eyed by the Ayrshire men as one of the most important events of the year. Breeders from 30 states and several foreign countries will attend the sale or approximately 75 head of the world's finest registered Ayrshires. Tom P. Whittaker will be sales manager. Requirements for the sale are stringent. All females with completed records must have made a mature equivalent 2X record of at least 9,500 lbs. milk or 380 lbs. fat, and have a butterfat content of not less than 3.9%. Dams of females not in milk must also meet these minimum requirements.

Not more than 10 bulls will be auctioned and these must have dams with an actual 2X M.E. record of not less than 10,000 lbs. of 4% milk. All the cattle offered for sale must come from herds that are T. B. accredited and under supervision for Bangs Control. They must also pass tests for T.B. and Bangs within 30 days prior to sale date, and be vaccinated for shipping fever.

A.B.A. President Charles M. Rodriguez, owner of Vista Grande Farm at Cropseyville, N. Y., expressed pleasure at the tremendous strides made by the Ayrshire breed during the past few years. The A.B.A. was one of the few livestock registry associations to register more cattle in 1949 than in 1948. The services rendered to breeders by 58 full-time men and women at the A.B.A. headquarters in Brandon were praised by Mr. Rodriguez as playing an important part in the growth of the breed.

Officers elected at the first meeting in 1875 were from New York, Massachusetts, Connecticut, Rhode Island, Vermont and Illinois. Today, the A.B.A. Board of Directors represents every region in the United States, and purebred Ayrshires are raised in all 48 states. The A.B.A. now has almost 9,000 members from coast to coast.

An essay contest for youngsters under the age of 18 launches the 75th anniversary celebration. The two winners of the contest will be given an expense-paid trip during the week of September 18, 1950, to the Eastern States Exposition in Springfield, Mass., where each will be presented a purebred Ayrshire calf.

Youngsters anywhere in the United States are eligible, whether or not they own any Ayrshire cattle. Essays on "The Ayrshire Is the Breed for Me," should be between 100 and 250 words and mailed to Contest Committee, Ayrshire Breeders' Ass'n., Brandon, Vt.

"Never saw such good times — Nobody wants to hire a bum."

How I Cut Costs With Birdsfoot Trefoil

By **ALTON L. CULVER**
Tompkins Co., N. Y., Dairyman

ON MANY FARMS there is some rough hilly land that is being pastured, and was pastured by our forefathers. Such land is for the most part green for a month or two in the spring and then turns brown. From there on until winter, these fields are little more than exercise lots.

The time has come for these neglected back lots to have a face-lifting. Plow and fit a good seedbed in these fields that have never had a load of manure or a pound of commercial fertilizer; then give them the recommended treatment of lime and phosphoric acid and sow broadcast about 5 pounds of inoculated broadleaf birdsfoot trefoil seed per acre. In some cases good seedlings have been obtained by sowing less seed per acre, but in general 5 pounds is the recommended amount.

How to Start

To establish a birdsfoot seeding, plow the land early in the spring or the previous fall, then harrow occasionally until about the 20th of June. This forms a firm seed bed and destroys as many weeds and as much natural clover as is possible. Clover is a decided disadvantage in a birdsfoot trefoil seeding, as it furnishes strong competition to the tiny birdsfoot plants. After the seed is sown broadcast, it requires no covering. Rolling or cultipacking may be a benefit.

If the topography of the land is such that it cannot be readily plowed, a heavy disc harrow may be used to fit the soil without plowing. In this case a limited amount of small brush is no problem, and much will be destroyed by the discing operation. Other organic matter, such as golden rod or natural grasses, is no disadvantage if the seed bed is prepared in this manner. It may prove to be an advantage because such chopped material will tend to retard erosion, thus storing moisture. It also acts as a mulch, which prevents evaporation during dry periods. Another definite advantage is that this organic matter mixed in the surface of the soil will give considerable protection during the following winter and spring.

The one greatest risk in establishing a seeding of birdsfoot trefoil is freezing, thawing, and subsequent heaving. There is little danger of winter-killing after the seeding is one year old. My personal experience is that birdsfoot should be sown alone and not mixed with other legumes or grasses. If sown with a nurse crop, the nurse crop should be pastured.

Controlling Weeds

Clip new seedlings of birdsfoot with a mowing machine once or twice during the summer and fall following seeding to keep weeds down. It has been my observation that little if any damage to the seeding is inflicted by pasturing. Animals walking over the ground press the soil tightly around the little plants and press the plants down to withstand better the following winter. It is my opinion that if the foliage is nipped off, root growth is stimulated.

Some articles that I have read give the impression that birdsfoot needs good fertile soil. I think this impression has no foundation.

Editor's Note: Some years ago, too much was said to the effect that birdsfoot would grow anywhere regardless of lack of fertility. It won't do that! Now perhaps, too much emphasis is being put on the need for a fertile soil.

Birdsfoot will produce more forage

or pasture than any crop that I know of on poor land. Apparently the only care it needs for years (indefinitely) is an occasional liming and fertilizing. Then again I wonder if it needs the lime and fertilizer. I recall many cases where it seemed to be better and thicker in the deadfurrows and ditches where the topsoil had been plowed or washed away.

In one case there was a field of birdsfoot along the highway. In reconstructing the road, the highway department had bulldozed all the topsoil off the roadside. During the years following, the birdsfoot has spread over the bulldozed area to the road ditch and grown so thick and rank that one cannot see the ground. Because the topsoil is acid and the subsoil alkaline in this area, it would seem that birdsfoot needs the lime, but what about the phosphorus? It seems reasonable that a sustained high production can be maintained over a period of years only with fertilizer or manure, or both.

No Bloating

Ladino clover is an excellent legume, probably best adapted to pastures and mixtures for meadow seedings. It also yields far better on fertile soils that lie in lower and more protected areas. Birdsfoot trefoil does well on a wide variation of soils and elevations. It is very drought resistant and will do well on wet soils. There is no danger of bloat from pasturing birdsfoot.

I have described as well as I can the ideal soil preparation and seeding procedure. However, birdsfoot may be seeded from March until the forepart of August with very good success.

When growing birdsfoot trefoil for hay, expect only one cutting in a season. However, it yields 2 to 4 tons per acre. If the elevation on which it is grown is less than 500 feet, two cuttings may be expected. The harvesting for hay may be delayed until well into August, and yet the quality and greenness are retained remarkably well. Other grasses which are mixed with birdsfoot will be overripe and very poor quality. For this reason I again recommend sowing birdsfoot alone. The hay should be raked quite green to prevent loss of leaves.

If silage is made from the first cutting of birdsfoot during June, a second cutting of very high quality hay can usually be had.

Harvesting Seed

The harvesting of seed is a difficult and very often a disappointing enterprise due to the green and succulent condition of the foliage at harvesting time. The seed pods shatter very easily. They may be made to open and drop their seeds by extremely hot weather, a dashing rain, or being left to stand a little too long. Most of these conditions, and sometimes all of them, are beyond the grower's control. There is always a reason for any article bearing a high price tag.

To my knowledge, there are no diseases or insects that harm birdsfoot trefoil yet. In the present economic situation, farmers are caught with lower incomes and high expenses. Over a period of years, I know of no other crop that will give a higher return according to the cost of production than birdsfoot trefoil on soil that is not suited to alfalfa.

WORLD'S FIRST Anti-Rust FARM FUELS

Today ordinary farm fuels have become old-fashioned. Today your Sinclair representative offers you farm fuels with an amazing extra value—a new chemical ingredient that solves the problem of rust and corrosion in your fuel tanks and fuel systems. It's RD-119, a product of Sinclair Research. The prescribed laboratory test, above, shows the amazing extra value of RD-119.

Get the extra value of the World's First Anti-Rust Farm Fuels—at no extra cost. Phone or write your local Sinclair Representative today.

New Anti-Rust SINCLAIR GASOLINES • TRACTOR FUELS HEATING OIL • KEROSENE

CORRECT HEALING OF THE VITAL MILK DUCT

demands, above all else, that the SHAPE of the duct be held in exact, normal position during healing. No device does this like scientifically-shaped, ivory-like BAG BALM Dilators. Smooth, flexible, sterilized and packed in medicated ointment. Will not dissolve, come apart or snag tissues. Cannot absorb pus infection. 25 in medicated BAG BALM. At all farm-supply stores.

DILATORS**

IF YOU MILK 10 COWS OR LESS... IT'S FOR YOU!

DE LAVAL SPEEDETTE MILKER

Time was when many people thought that you had to be milking 15 or 20 cows before a milker would really pay off.

That was before the De Laval Speedette Milker was introduced. Especially designed for milking the herd of 10 cows or less, it is saving users up to 2 hours a day... producing more and cleaner milk... and saving a lot of hard, disagreeable work that is now so unnecessary.

So simple that anyone can use it... so dependable you never worry about milking... and so inexpensive to buy, install and operate that you can't afford to be without it.

If you milk 10 cows or less and are tired of the daily drudgery of hand milking... see your local De Laval Dealer today.

De Laval Speedway Water Heater

Engineered for the dairyman. Supplies 12 full gallons of 185° water. "Lifetime" copper tank. Easy to clean.

De Laval Junior Electro Separator

Streamlined and efficient. No gears, no belts, no oiling. Direct drive. Cleanest skimming, quiet operation. Capacity: 400 lbs. per hour.

■ **PUMP REQUIRES NO OIL**—You never have to oil the De Laval Speedette vacuum pump. Its economical 1/4 hp. motor operates on only 110 v. lighting circuit. It gives lowest cost milking.

■ **QUICK, LOW-COST INSTALLATION**—The Speedette can be installed in an hour at correspondingly low cost, thanks to special fittings which do away with costly pipe cutting and threading.

■ **MOST EASILY CLEANED PIPE LINE**—The new type De Laval Speedette pipe line, because of its special fittings, can be taken down in short sections for inspection, easiest cleaning, sure sanitation.

Better Meals the Year 'Round with the DE LAVAL SPEEDWAY FOOD FREEZER

Better table fare, at lower cost, with less work, and brought to you by dependable De Laval Speedway Food Freezers, which are designed especially for farm use. Three sizes—8, 16½ and 35 cu. ft.

Preservatives for GRASS SILAGE

SOME YEARS back when grass silage was tried at intervals, one of the chief disadvantages mentioned was the strong smell which grass silage usually developed. Realizing that grass did not contain as much sugar as corn, various experiments were undertaken to find a possible material to add to grass silage to improve quality by increasing acidity.

For example, after some trials, phosphoric acid was recommended, but at present we do not hear much about it. At the New Jersey Experiment Station cows were fed on grass silage which had phosphoric acid added when it was put in the silo. They ate large amounts of silage but tests indicated that the urine was so acid as to make heavy feeding of this silage inadvisable.

Wilting

During the war when it was difficult to get molasses, putting up silage by the wilting method was recommended. This consisted only of allowing the grass to remain in the swath after cutting until the moisture content was about 65%.

Some good silage resulted, especially where the percentage of legumes in the mixture was not too high. However, some definite disadvantages developed. For one thing it is practically impossible for anyone to judge accurately the degree of moisture in grass. If grass were allowed to wilt too much, mold would develop in the silage with a loss of nutrients and palatability. If it was put in too wet an objectionable odor frequently resulted. This objectionable odor comes from the development of butyric acid which is the same substance that you find in rancid butter.

Many a dairyman has questioned the advisability of putting up grass silage because his wife complained about the "stink" and in some cases, milk, which everyone knows absorbs odors easily, was returned from the station because of off-flavor.

Molasses or Grain

As a result of the lack of uniformity in making silage by the wilting method, most authorities now recommend the use of a preservative as an insurance factor. Two materials most commonly recommended now are molasses at the rate of 100 pounds to the ton or ground corn and cob meal, hominy, or some form of grain at the rate of 300 pounds to the ton.

In a recent discussion about grass silage, John Babcock who is known to our readers as an occasional guest contributor to *Kernels, Screenings & Chaff*, made the following suggestion. Where grain is used as a grass silage preservative it is just as effective to spread the grain on the bottom of the truck as it is on the top of the load if the truck is fitted with an unloader. Most unloaders have a false front on the truck which is pulled backward by a motor and it is easy to see that the grain is mixed just as well when it is put on the bottom of the truck as it is if put on the top of the load. The only advantages of grain over molasses are that it is often available right on the farm without cash cost, and in many cases it is less messy to add to the grass silage.

A number of different ways of adding molasses have been tried. The simplest is to put the molasses in a barrel or tank above the silage blower or cutter and run in the molasses as the grass goes through. The amount to apply can be determined by check-

ing the time that it takes to run a ton of grass through the cutter or blower and checking the time which is required to run a given weight of molasses on the grass. The one trouble is that molasses will run more slowly as the temperature gets colder. To offset this it has been suggested that molasses could be kept in an air-tight container and that a compressor, which is now found on many farms could be used to compress the air in the tank above the molasses.

Pipe Clogging

It is also necessary to turn off the molasses just before the last grass in a load goes through the blower, and to turn it on only after the next load has started to go through the blower otherwise you may clog your delivery pipe. While it has been stated that the use of molasses should not result in a clogged pipe if the blower or cutter is properly adjusted, it is a fact, nevertheless, that many a dairyman has used cuss words because the pipe did clog from time to time.

Pumping molasses to the top of the silo and adding it just as the grass is blown in, has been tried. Two disadvantages here are: First, that this set-up costs more money; second, there is serious doubt that the molasses is adequately mixed with the grass. This whole problem of ease of adding molasses is being studied and new developments will be reported to you from time to time.

Sulfur

The newest method of insuring good quality grass silage is to use sulfur dioxide. This is a gas which comes compressed in cylinders. After a foot or two of silage has been added to a silo the gas is introduced through a pipe connected to the cylinder and pushed down a foot or so in the silage. A valve is opened and the amount of gas added is figured on the basis of the

(Continued on Page 23)

Allegany County, New York, dairymen are quite convinced that their homegrown roughage is their cheapest source of feed, consequently they are determined to produce not only quantities but also quality.

This year more than 150 samples of hay and silage were exhibited at the 4th Annual Dairy Congress at Friendship. In picture, Walter Kopp, right, of Rushford, N. Y. and 1949 Hay King, crowns Donald Holcomb of Portville as "1950 Allegany County Hay King." Donald Holcomb is just a beginner in the farming business but, he is well on his way to success with a good roughage program.—H. I. Blixt, Allegany County Agent.

The bridge that runs from Wyoming to Boston

It's a long way from Medicine Bow to Boston . . . from the western cattle and sheep range country, from the feed lots and hog farms of the Corn Belt, to the hungry cities of the east. Between where the meat animals are raised and where the meat is eaten there's an average gap of a thousand miles.

Bridging that gap is a service performed by the meat packing companies of the United States. They buy the livestock on the farms and ranches, and in the scores of markets. They process it into meat. Then they deliver that meat to 300,000 retail stores in every city and town across the nation.

It's truly a nation-wide job. And just as truly it's a necessary and important one. For without this "bridge" that runs from Wyoming to Boston—without the meat packers' "pipe lines" which link supply to demand—livestock producers would have to limit their herds and flocks to the numbers that their small local markets could consume. And the supply of meat available for consumers to eat would be limited by the small numbers of livestock produced near the cities where they lived.

We of Swift are proud of our company's part in starting, organizing and carrying on the nation-wide distribution of meat. Gustavus Swift pioneered in the development of the refrigerator cars which made the whole thing possible. Today thousands of refrigerated freight cars and trucks supply the Swift network of refrigerated branch houses and plant sales routes which crisscross the nation. It is an important factor in one of the world's most efficient low-cost food distributing systems . . . Yes, we are a part of that great "bridge" which serves and benefits producers and consumers alike. And we are mighty proud of it!

OUR CITY COUSIN

Have come unplanted!"

Marketing Clean Cream

by T. J. Claydon
Department of Dairy Husbandry
Kansas State College
Manhattan

T. J. Claydon

When it comes to *marketing clean cream*, dairymen can't even trust the air they breathe. Even on clear days, the air is filled with sediment. This material settles into containers and utensils and contaminates cream that is openly exposed. On the way to market, dust commonly collects around the edge of cream container lids. This sediment is jarred into the cream when lids are removed. On the farm—and en route to market—it is *good business* to protect cream, containers and equipment.

Clean cream is also dependent upon the use of approved-type dairy utensils that are unsoiled and in good repair. Old pots, crocks, syrup buckets and worn-out dairy containers should not be used. Such pieces of equipment are carriers of rust and collectors of dirt. They are not easily sanitized and cannot be tightly covered to keep out dust.

Cream is *practically clean* as it leaves the spout of mechanical separators, according to farm and laboratory investigation. Hand skimming and water dilution methods of separation leave some sediment in cream. Well-kept separators also have proven the most economical means of separating cream. *The marketing* of clean cream, however, is not assured by use of the mechanical separator. Cream that is sold with poor sediment test is a problem of concern to both the producer and butter manufacturer. *Attention to detail*, all along the line, is an answer to this problem.

Quote of the Month

"Plastics from animal hair, drugs to ease your aching back, and steaks guaranteed to melt in your mouth: Research on these and hundreds of other major and minor projects is being pressed in packing house labs."

The Wall Street Journal

Soda Bill Sez:

You will never be broke as long as your earnings keep ahead of your yearnings.

If the mistakes others make annoy you, remember, you could make them all yourself.

Well Dressed U. S. Girls

Last fall a group of people from Uruguay visited us in Chicago. They noticed the girls who work in our office returning from their noonday meal. One of the Uruguayan ladies asked, "Are they visitors, like us?" "No," we replied, "they work here as stenographers and clerks." Astonished at how well they were dressed, she commented, "Certainly the business of the United States, and the so-called 'capitalistic system' must be all right, for I notice that all your women have that well-dressed look. There are not many countries in the world where working girls could do that."

GROWING IS GOOD

When I was a boy I liked to watch living things thrive and grow. Growing was *good*. That's the way I still feel. And that's the way Americans have always felt. As a nation we have grown from thirteen states to forty-eight—across the entire continent. We have grown in size and numbers, in strength and power. It's an American trait to be proud of growth.

Yes, whether it's the nation or livestock, men or businesses, I believe *growing is good*. Many companies have grown in size to meet their responsibilities. They served better.

Why has Swift & Company grown?

Most important is that people liked what we could do for them. Retail meat dealers learned that we provided the products and services they needed. Everything we sell must win the favor of the public. We were pleased to find housewives asking food stores for more of our meats, and asking for them oftener. We had to grow to keep up with the expanding demand for our services and products.

A lot of livestock and other products are needed to meet this demand. To get them we must buy in many markets. We're dealing with big areas and long distances and with food stores in every corner of the nation.

Meat packers of all sizes are needed to handle the nation's huge volume of livestock, and to process and distribute the meat. Some of these began business many years ago and have grown to serve producers and consumers across the nation. Swift & Company is one of these which grew up because there was a big job to do.

Hope you have a fine summer. If you get to Chicago be sure to drop in and see us. We will be with you again in September on this page.

Martha Logan's Recipe for BARBECUED FRANKS

Prepare a thick barbecue sauce. Add one cup sauce for each one pound of frankfurters and heat 5 to 8 minutes.

Thick Barbecue Sauce:
2 small onions, sliced thin 1 tsp. chili powder
2 tbsp. vinegar 3/4 cup water
2 tbsp. Worcestershire sauce 3/4 cup catsup
1 tsp. salt

Mix all ingredients in a heavy skillet. Cover and simmer about 45 minutes. Yield, 1 pint sauce.

Northeast Farms Get High Yields of Feed Grains

(Continued from Page 1)

Mohawk type are resistant to the common strains of rust in the Northeast and much stiffer strawed than the old varieties. Since the yields are not limited by rust to the extent that once was true, and since they are stiffer strawed, and lodging is not generally as serious a problem as it once was, more nitrogen can be applied profitably in many instances. One can overdo the nitrogen, though, particularly if the oats are seeded to a hay or pasture mixture. Excessive nitrogen can still result in lodging or a rank dense growth detrimental to the seeding.

A Broad Outline

What fertilizer to use and how much is dependent on the crop, on the soil, what kind of a sod, if any, will be plowed, how much manure will be applied, or has been applied within the past year. Obviously, it is not possible to estimate the amount of fertilizer that will be most profitable to the nearest pound or whether 300 pounds of 5-10-10 will be more profitable than 350 pounds of 4-12-8. We do not know what the weather will be and we are also dealing with constantly changing Nature. We do have the recommendations of the State Agricultural Colleges that are based on many years of research and farm observations. These provide "guide posts" from which one can plan a sound fertilizer program. Analyses and rates can, in fact often should, be varied somewhat from them to fit the particular set of conditions.

Some facts to keep in mind are; first, that sandy soils are usually more deficient in nitrogen and potash than silt and clay loams and that for a cultivated crop like corn on a sandy soil it is likely to be best, if the fertilizer rate is heavy, to apply part of the nitrogen in the mixed fertilizer and the remainder later as a side dressing. In other words, for corn on a sandy soil instead of a 6-12-6 or a 10-10-10 at planting time, a 5-10-10 is likely to be preferable providing a side dressing of a straight nitrogen material is made at the last cultivation.

Second, the manuring program must be taken into consideration. Manure is usually a good source of nitrogen and is also a good source of potash if the bulk of the liquid portion is saved by use of sufficient bedding or otherwise. Manure is a poor source of phosphoric acid and unless it is reinforced with superphosphate, the commercial fertilizer applied for the crop should be relatively high in phosphoric acid as compared to nitrogen and potash. In other words, if 300 pounds of 10-10-10 was the tentative program, a shift to 500 pounds of 6-12-6 would likely be better if the manure was not superphosphated. The same amount of nitrogen and potash being applied, but twice as much phosphoric acid. Only about one-half of the nitrogen in manure is available to crops the year it is applied. This means about 5 pounds of nitrogen per ton of manure. One hundred pounds of a mixed fertilizer analyzing 5% nitrogen contains as much. If ten tons of manure not reinforced with superphosphate are applied, the total plant food contained would be equivalent to about 1,000 pounds of a 10-5-10 commercial fertilizer, if, though, the manure is reinforced with 50 pounds of 20% superphosphate per ton, it would be equivalent to 1,000 pounds of 10-15-10. All of the nitrogen in the commercial fertilizer will, though, be available the year applied.

Most corn in the Northeast is planted on sod. What kind of sod makes a big difference in the amount of nitrogen available to the corn. High yields of corn are possible only where there is an abundance of nitrogen. It is con-

sidered that a good legume sod is the equivalent of 100 pounds of nitrogen (the amount in 1,000 pounds of 10-10-10). A timothy sod probably has no more than 25 pounds of nitrogen (the amount in 250 pounds of 10-10-10). Mixed legume and timothy sods would fall in between depending on the proportion of legume remaining. In Cornell experiments conducted some years ago, the difference between corn on alfalfa sod and corn on timothy sod was about 26 bushels of shelled corn to the acre. Substantial differences in favor of alfalfa also continued for two years in succeeding crops of oats and wheat.

In growing corn, if one is aiming at 100 bushels of shelled corn per acre or 20 tons of silage, about 1,600 pounds of 10-10-10 per acre would have to be applied if all of the plant food was to come from commercial fertilizer. We quote this example, not as a recommended rate. Since we can guess the nitrogen supplied by different sources closer than the other plant foods, we will illustrate fertilizing for a 100 bushels of shelled corn and we will need 160 pounds of nitrogen, not allowing for any loss. From 15 tons of manure we would get 75 pounds of nitrogen; from a timothy sod, 25 pounds, which leaves us 60 pounds needed in commercial fertilizer which can be supplied with 600 pounds of 10-10-10. If we start with an alfalfa or clover sod, though, we have 100 pounds; 8 tons of manure would supply another 40 and 200 pounds of 10-10-10 the remainder of the 160 needed. Not everyone wants to try for 100 bushels of corn or 20 tons of silage to the acre and only the best land is suitable. In trying for such yields, planting rates, soil tilth and many other things become important. When heavy rates of fertilization are practiced, it is usually best to apply at least one-half of the fertilizer broadcast and plow it under.

Typical Recommendations

New York: 150 to 400 pounds of 10-10-10 depending on the amount of manure also applied.

Vermont: 300 pounds of 8-16-16.

New Jersey: Not manured. 500 to 700 pounds of 5-10-10 plus 150 pounds of ammonium nitrate at last cultivation; manured land 300 to 500 pounds of 4-12-4.

Pennsylvania: On fertile soils or with manure, 200 to 250 of superphosphate or 4-12-4; without manure on only moderately fertile soils 200 to 250 pounds of 4-12-8, 3-12-6 or 5-10-10.

The above differences in recommendations naturally reflect difference in soils and in manuring practices.

We won't attempt to illustrate the fertilizing of oats to the extent we did with corn. The same factors, though, govern. A 50 bushel oat crop will only use about one-third as much nitrogen as a 100 bushel crop of corn. Typical state recommendations follow:

New York: For oats seeded to hay or pasture. Manured — rotation 400 pounds of superphosphate or 300 pounds of 0-20-20. Unmanured—rotation — 350 pounds of 6-12-6 or 250 pounds of 8-16-16. Unseeded oats in a manured rotation 250 pounds of 6-12-6 or superphosphate. Unseeded oats in unmanured rotation 350 pounds of 6-12-6 or 250 of 8-16-16.

New Jersey: 300 to 500 pounds of 4-12-8 plus, if they are to be seeded, a separate application of 500 pounds of 0-14-14 per acre.

Pennsylvania: On fertile soil or with manure, 250 pounds of superphosphate 0-14-14 or 4-12-8 or 3-12-6. Without manure on only moderately fertile soils 200 to 300 pounds of 4-12-8 or 4-12-12.

Planning for the Control of ORCHARD PESTS

By E. Stuart Hubbard

President, N. Y. State Horticultural Society

WE HAVE attended winter fruit meetings and spray schools. We have packed and marketed much of our fruit. We have spent much thought on the economic situation and our financial problems.

From this mass of interwoven fact, fancy, data, machines, materials, methods, market trends and a realization of one's personal and material limitations there emerge certain fundamentals.

Consumers appreciate a handsome, perfect, fine flavored apples delivered fresh at convenient places in constant supply. There has been a record movement of this fine quality apple crop but at prices that have weakened the financial reserves of a great many apple growers.

There is ample reason to believe that there are many factors favorable to the producer of good apples the coming year. There is reason to expect that many of the adverse factors will be less harmful or absent this year.

We therefore plan to proceed confidently but cautiously.

In analyzing our balance sheet it is evident that the shrinkage in sales value, which was the lowest in eight years, was so great that our lower production costs had little effect on the net return.

Our difficulties were so largely climatic: in the production of a national surplus of nearly all fruits and by damage to the size, quality and yield of our own through frost, heat and drought, that we can rather confidently look for more normal conditions the coming season. And, with normal conditions our fruit sales have always been ample to bring a net profit over costs.

So we are planning to do what we can to lessen the frost damage by re-

moving trees in low spots; to lessen injury by drought by removing trees on the driest spots, by removing part of the trees to provide more root space for those remaining; and by pruning so heavily as to reduce the leaf surface somewhat on the drier areas.

We will continue to spend what money and time we can spare for fertilizer, for brought in mulch whenever possible and for moderate broadcasting of manure in the winter and early spring.

We are doing but little detail pruning of small wood but are pruning as much of the orchards as possible with a few expert men in cutting larger branches so as to be able to cover the under side of the lowest branches with spray, to make openings in the sides of the trees at different levels to permit the free passage of spray across the inside of the tree; and to keep down the highest tops to a regular level for more exact dust and spray coverage.

In spraying equipment we expect to lessen our labor, material costs and, we believe, increase our efficiency, by dusting in early applications when possible, by using a new mist sprayer requiring a driver only; by putting a "Maine" mast on the front of each of

two tractors for the driver alone to use with our power spray rigs; and by endeavoring to apply so thoroughly the right materials, and time applications so correctly that we shall need fewer special or extra sprays.

We believe our customary D. N. dormant sprays for aphid varieties, the oil-bordeaux delayed dormant spray for mites and many insects; sulfur, dust or wettable, for scab; fermate for rusts and for better finish on Golden Delicious, are still the safest and most reliable materials through bloom. After bloom there are so many problems of insects or diseases, weather, machines used, operator ability, etc., and there are so many materials, old and new, to choose from that we cannot lay out an arbitrary chart that we can expect to follow exactly.

In all these details we religiously respect the physical welfare of the tree above and below ground by choosing materials that damage the least the breathing and photosynthesis action of the leaves; that interfere the least with the best biological, chemical and mechanical conditions in the soil, and that result in the most delicious, beautiful and wholesome fruits to attract, delight and nourish our people.

—A.A.—

GRANGE ESSAY CONTEST

A nation-wide essay contest on "Soil Fertility and the Nation's Future" with \$10,000 in prizes has been announced by the National Grange and the American Plant Food Council. It is for young men and women through 20 years of age and it ends April 15. Entries are to be sent to the nearest Subordinate Grange. They should not exceed 800 words.

Say you saw it in AMERICAN AGRICULTURIST

THE MARCH 15TH GETTYSBURG ADDRESS

One-score and 16 years ago our fathers brought forth upon this nation a new tax, conceived in desperation, and dedicated to the proposition that all men are fair game.

Now we are engaged to a great mass of calculations, testing whether that taxpayer, or any taxpayer so confused and so impoverished, can long endure. We are met on Form 1040. We have come to dedicate a large portion of our income to a final resting place with those men who here spend their lives that they may spend our money.

It is altogether anguish and torture that we should do this. But in the legal sense we cannot evade—we cannot cheat—we cannot underestimate this tax. The collectors, clever and sly, who computed here, have gone far beyond our power to add and subtract.

Our creditors will little note nor long remember what we pay here, but the Bureau of Internal Revenue can never forget what we report here. It is for us taxpayers rather to be devoted here to the tax return which the government has thus far so nobly spent. It is rather for us to be dedicated to the great task remaining before us; that from these vanished dollars we take increased devotion to the few remaining; that we here highly resolve that next year will not find us in a higher income tax bracket. That this taxpayer, underpaid, shall figure out more deductions, and that taxation of the people, by the Congress, for the government, shall not cause our solvency to perish from the earth.—Anonymous.

Repower your FORD Car or Truck with an Authorized Reconditioned Ford Engine

ONLY AN **Authorized** RECONDITIONED FORD ENGINE GIVES YOU ALL THIS:

- ★ One-day installation.
- ★ Genuine Ford Parts—new or completely reconditioned.
- ★ Built and tested to Ford-factory standards in Ford-authorized, Ford-inspected plants.
- ★ Material and workmanship fully guaranteed by authorized reconditioner.
- ★ Costs only a few dollars more than a ring and re-bore job.

Wireworm Control With CHLORDANE

By DR. R. W. LEIBY

Extension Entomologist, Cornell University

SIX POUNDS of actual chlordane applied to an acre of soil gives 80 to 90 per cent control of wireworms according to tests conducted in New York over a period of two seasons. Its use by a few growers under field conditions has also shown its effectiveness. Although an unqualified recommendation can scarcely be made at this time, taste tests made thus far of cooked potatoes grown in soil treated with chlordane at six pounds per acre have not indicated any off-flavor or odor produced by the chemical.

Growers of potatoes or other crops might wish to try the chlordane treatment but only in fields or parts of fields where they have a wireworm problem.

The chlordane is distributed best by spraying or dusting machine. It is applied in early spring preferably after the soil has been plowed and then worked into the soil one to three inches deep by further fitting of the land. It may be applied just before the potatoes are planted.

Distribute Evenly

Special efforts must be made to distribute the six pounds of actual chlordane over an acre uniformly. If applied at a higher dosage to a part of an acre, the potatoes in that area might have a slight off-flavor. If applied at less than six pounds per acre, the wireworms may not be killed by the chlordane vapors.

A 50 per cent wettable powder of chlordane may be purchased and in this form it is used at the rate of 12 pounds per acre. This could be added to 100 gallons of water and applied in a potato sprayer to an acre. The chlordane is available also in an emulsifiable form at various strengths. The following quantities are needed per acre to be equal to six pounds by weight of actual chlordane; 40% strength—2 gallons; 72% strength—3 quarts; 90% strength—2 quarts. These quantities may be added to 100 gallons of water and applied to one acre of soil.

Dusts containing 10 per cent or 5 per cent of chlordane can sometimes be purchased. To get six pounds of a ten per cent strength dust on one acre would require the use of 60 pounds. If 5 per cent strength is used, 120 pounds of dust would be needed for an acre.

The chlordane can be mixed with fertilizer and then broadcast prior to soil fitting. Care must be used to apply uniformly the proper amount of 5 pounds of actual chlordane to an acre regardless of the fertilizer. It should not be applied in the row when mixed with fertilizer.

WHAT DO YOU THINK?

(Continued from Opposite Page)

to increase each item of canned goods 5 or 10 cans each year.

She says, "I would be lost without the garden. I spend many hours outdoors in the fresh air and sun and feel that this is a real contribution toward my good health. It doesn't hurt your waistline either!"

Authoritative substantiation of what these ladies have to say about their gardens comes from Richard Hopp, assistant horticulturist at the Vermont Agricultural Experiment Station. His first reason for producing vegetables in the home garden is to be able to harvest them when quality is at its peak. The second reason for a garden is its actual value in dollars

and cents. "The value," he says, "is often overlooked." He says that it has been estimated that around 30,000 to 40,000 farm and city gardens have been grown in Vermont in recent years, and that at a conservative estimate of \$150 worth of produce each, the total value in the State is around 6 million dollars. "This may be a hidden income," he says, "but it means that these 6 million dollars are available in the state to be spent on other things."

Another New Englander, William A. Burt, of Exeter, N. H., has this to say about gardens:

"I read with interest the letters to you about whether a home garden pays or not. 'It is my opinion, as one other person remarked, that it cannot be valued in dollars and cents. One gets so much more out of a garden than can be bought with money, to say nothing of the convenience of having things at a moment's notice—fresh in the summer, canned in the winter. One wouldn't be likely to buy as much if he had to depend on the store entirely."

"It brings to mind the story of the farmer who decided it was too expensive and too much bother to raise a pig—he'd buy his pork when pig-killing time came. Finally, he decided he'd like some. He went to his pork barrel; it was empty. He went to his pig pen; that was empty too. Then he opened his pocketbook, and that was empty. He kept a pig after that. The 'littles' one puts into it don't seem to amount to much at the time, but it makes a big difference at harvest time."

— A.A. —

FERTILIZING A YOUNG ASPARAGUS BED

Reporting on work with young asparagus beds, E. P. Brasher, Delaware Experiment Station, recommends that 800 lbs. of a 5-10-10 fertilizer be applied in early spring and a like amount after harvest. A sidedressing in August with 200 lbs. of muriate of potash per acre improved yields even though 1,600 lbs. of a 5-10-10 fertilizer had been applied during the early spring. The fertilizer should be applied over the row rather than over the whole bed or in bands.

— A.A. —

USE LIMITED SPACE FULLY

If you have a backyard village garden, put the rows relatively close. You will have to cultivate the garden by hand anyway, and putting rows of smaller crops just a little farther apart than the width of a garden rake will make better use of the space you have available, and will help you in controlling weeds.

A garden rake is an excellent cultivating tool if used before the weeds get a start. It will kill them and will not go deep enough to injure the roots of the crops. Then as soon as the crops get a good start they will practically cover the ground which is very discouraging to weed growth.

— A.A. —

Cauliflower on Long Island needs 15 lbs. of borax per acre to prevent brown rot on the heads, and hollow stem. Where the fertilizer did not contain enough borax, it may be applied as a sidedressing with nitrate of soda or it may be sprayed onto the plants. If the weather is rainy enough to leach the borax out of the soil, it is advisable to sidedress cauliflower with 10 lbs. of borax per acre, even though the fertilizer contained 15 lbs. (1/4 of 1%) of borax.

Get ALL TEN advantages of

NATURAL CHILEAN NITRATE

- 1. Natural.** Chilean Nitrate is the only natural nitrate in the world.
- 2. Nitrate Nitrogen.** The nitrogen is 100 per cent nitrate.
- 3. Sodium.** Chilean Nitrate contains sodium equivalent to about 35% sodium oxide (Na₂O). This acts like potash (K₂O) and helps to make the phosphate in the soil more available.
- 4. Iodine.** Chilean Nitrate contains iodine to help meet the needs of plants, animals, and human beings.
- 5. Other Plant Food Elements.** Chilean Nitrate contains small quantities of other elements that contribute to strong, healthy plant growth, such as manganese, potassium, magnesium, boron, calcium, iron, sulphur, copper and zinc.
- 6. Ideal Condition.** Chilean Nitrate

comes in free-flowing pellets—easy to handle and to apply in any distributor.

7. Quick Acting. Chilean Nitrate is immediately and completely available.

8. Anti-Acid. Chilean Nitrate helps keep the soil sweet.

9. Time-Tested. Chilean Nitrate has been proved by more than 100 years of research and practical farm experience.

10. Doubly Profitable—Economic. Chilean Nitrate improves the quality of crops as well as the yield. Consistently excellent effects of heavy applications year after year upon crop and soil alike make it an outstandingly profitable, economical nitrate.

AMERICAN AGRICULTURIST

10 N. Cherry St., Poughkeepsie, N. Y.

A three-man crew can plant 500 seedlings an hour working under ideal conditions as shown above. Man at left keeps grip on seedling to see that it is firmly set before moving on to the next one. Man at right drives mattock almost straight in and while left hand is still on mattock, reaches for seedling from bucket man.

A Three-Man Planting Crew

By HENRY S. KERNAN

THIS spring approximately 25,000,000 tree seedlings will be distributed for reforestation by the New York Conservation Department and other agencies. Some will be planted by machines, but the greater part will be set in the ground with a mattock.

In organizing a crew for hand planting, the usual method is to assign one man the job of opening the hole and a second that of carrying the trees, inserting one in each hole, and packing the earth around the roots firmly. These two-man crews are lined up the desired distance apart and guided by one or several flags as the length of the field requires. The average number of trees planted per man day using this method varies from 500 to 800 according to the experience of the labor and the planting conditions.

Another and far more efficient three-man crew is now being advocated by foresters. Here two men plant while the third passes out trees, checks on the spacing and alignment, and watches for careless work. The mattock must be swung so that when the blade is driven into the ground, the end of the handle is below the knees. Otherwise the seedling cannot be set upright. Next the planter receives the tree in his left hand from the bucket man. Holding it at the juncture of the root and stem, he inserts it into the hole so that the roots point down and are spread. With the mattock in one hand he taps, but does not pound, the soil around the roots, all the while exerting a slight pressure upward with the hand setting the seedling until he feels that it is firmly in place.

The bucket man's job is not wearing, so that by changing every 500 trees, the need for rest periods can be eliminated. Moreover for every tree planted, only one man is bending instead of two.

Using this method, I have no trouble planting 4,000 trees a day, even with two inexperienced men, on brushy and rocky ground. With excellent conditions we have easily done 500 trees an hour.

NEW YORK CO-OP COUNCIL ELECTS

A. G. Waldo of the Canastota Growers Cooperative Association was re-elected president of the New York State Council of Farmer Cooperatives at the Council's second annual meeting at Syracuse. Other officers are: Roswell P. Kinney of Eastern Milk Producers Cooperative Association, vice-president; Paul Taber of Cooperative G.L.F. Exchange, treasurer; and Prof. G. W. Hedlund of the Department of Agricultural Economics at Cornell, secretary.

Ernest Miller of the Hortonville Grange Cooperative Association was

elected to the Board of Directors to fill a vacancy and Paul Taber to succeed C. L. Dickinson.

Since the Council organized a year ago, nine new members have been added, making a total of 30 cooperatives in the Council. The new members are: Western New York Milk Producers Co-op Ass'n.; Accord Farmers Co-op, Germantown Co-op Ass'n.; Hortonville Grange Co-op Ass'n., Capital District Co-op; N. Y. Certified Seed Growers' Co-op; N. Y. State Sheep Growers Ass'n.; Oak Orchard Producers Co-op; and the Producer-Canners Co-op.

CAMP MINIWANCA SCHOLARSHIP

AGAIN this year *American Agriculturist* is offering a scholarship with all expenses paid at a two weeks' leadership training course at Camp Miniwanca, Shelby, Michigan. The scholarship will be awarded to some young man in the Northeast between the ages of 17 and 21. The winner will be chosen primarily on the basis of his leadership experience in organizations to which he belongs.

If you would like to apply for this, write to *American Agriculturist*, Dept. M, Savings Bank Bldg., Ithaca, N. Y., giving the following information:

1. Your age and birthday.
2. The youth organizations to which you belong, honors you have won as a member of these organizations, and leadership contributions you have made to them or to your local community.
3. Names and addresses of 3 adults other than your parents as references.

If you know of some young man who might be interested in the scholarship and who would profit by it, we would appreciate it if you would call this opportunity to his attention.

Last year's scholarship was won by Frank L. Arnold, Jr., of Rushville, N. Y.

How I Grew 144 Bushels of Shelled Corn per Acre

By Harold Metzner

THIS yield of 144 bushels of shelled corn was obtained under normal commercial dairy farm conditions. If it had been grown to produce a maximum yield regardless of cost, there would be no point in my telling you how we grew it.

I operate Roy Shaver's farm in Dover Plains, N. Y., on a profit sharing basis, so you see I have to make ten cents profit in order to have a nickel for myself. This type of program does not leave much latitude to do things for show.

This crop was not obtained by one year's good farming practice alone. I am sure that we did not do any more diligent job on our corn crop in 1949 than hundreds of other farmers did. I feel that the main reason for the results that we got is the fertility that we built into the soil over the past seven years and the choice of a variety that is bred to take advantage of that condition.

Neglected Acres

In order for you to appreciate what can be done to make poor soil yield corn up to Mid-Western standards, I will give you some of the background of Dover Dale Farm and the field that yielded 144 bushels per acre.

This farm had been tenant-operated from 1905 to 1928, and from '28 to '39, and had been used for pasture and standing hay sold to the highest bidder. In 1940 before Roy Shaver purchased it, the whole farm of 257 acres with 230 tillable only cut 40 tons of hay. Today this farm grows hay and ensilage and 80 per cent of the grain for 115 head of stock. These are big Holsteins and we feed very liberally; many of the cows weigh 1,600 pounds.

Our usual crop program is 40 acres of alfalfa, 25 mixed hay, 55 corn, 20 oats, 10 wheat and 60 acres of improved ladino pasture. We rent 100 acres of pasture for dry stock. The topography of the land is good, being level to gently rolling. The texture of the light to medium loam soil is well suited to corn and alfalfa.

Building Fertility

The field that we entered in the De-Kalb contest in 1949 had never been plowed or manured before Mr. Shaver bought the farm and I came on it in 1943. The cedar stumps were on it when I plowed it in the spring of '43

and it looked like it might furnish a month's pasture for some dry stock. There were no legumes so it was necessary to get some started as soon as possible. Contrary to usual practice, we plowed up sod and planted oats, seeding it down to clear alfalfa. The pH was only 5.5 so 3 tons of limestone was applied. Five hundred pounds of 5-10-5 was sown in the drill with the oats and alfalfa. The oat crop was very poor, yielding only 18 bushels per acre.

The new seeding of alfalfa came on good. I had planted 18 pounds per acre. The next year I tested the soil and found it low in everything but lime, the pH being 6.8. I applied 700 pounds of 0-20-20 after the first cutting. We had excellent alfalfa from that field for four years. I applied 500 pounds of 0-19-19 the third year when tests showed phosphorus and potash slipping again.

During the four years, we had taken three cuttings every year except one. When it was plowed for corn there was still a half catch of alfalfa left. Our treatment of this field prior to planting the corn is what I mean by building fertility into the soil. By generous applications of phosphorus and potash, we maintained vigorous stands of alfalfa, the alfalfa built up the nitrogen in the soil and there were still good amounts of phosphorus and potash left over from the 0-20-20 application, plus a lot of humus in the form of inch-thick alfalfa roots.

For the 1948 corn crop I applied 2 tons of ground limestone, the pH being down to 6.2, so that the ground would be up to pH 7 when the alfalfa would be planted 2 years later. We applied about 12 loads of manure per acre, which was the first manure this ground ever had other than cow droppings. We put on 500 pounds of superphosphate per acre since we had not used it in the stable. I do it this way to be sure of a more even application. Four hundred pounds of 6-12-6 was put on with the cornplanter.

The ground was fall plowed for the 1948 crop. We plow 8-9 inches deep for corn since we have sufficient depth of top soil. I feel that a deeper seed bed holds more moisture and also buries a lot of weed seeds deep, so that they can't get up to the top so fast and start with the corn.

We harrow the ground as much as

(Continued on Page 21)

A 15-YEAR-OLD VETERAN

I THOUGHT your readers might be interested in one of our old foundation cows. Her name is Butter Girl Aaggie Colantha Segis. She is 15 years old and has just completed a DHIA record of 19,100 pounds of milk, 705 pounds of fat 3.7% test, milked twice a day for 365 days. Many of the animals in our herd trace back to

this old cow and we are using a son of hers as one of our herd sires.

We have been using bulls in our herd for a number of years from the cow family of Mr. LaMotte which you featured on the cover of the July 16, 1949 issue of *American Agriculturist*. Fall Creek Ormsby Ace, our former sire from Mr. LaMotte's herd, was a grandson of the No. 1 cow in the series and he was sire of the No. 5 heifer. We have three herd sires and one former sire of Mr. LaMotte's breeding. Three are sons of over 100,000 pound cows and one is a grandson of a 100,000 pound cow.

Our Aaggie Cow's son, sired by Fall Creek Ormsby Ace, combines the blood of two outstanding long-lived cow families and I believe he will breed into his daughters the qualities that have kept these two old cows producing and reproducing for so many years.—James Robertson, Laurens, N. Y.

control
your
harvest

It's a comfortable feeling to have your own ALL-CROP harvester, independent of a neighborhood harvest. You — one man — are in complete control.

Who decides what day to begin harvesting? You do. There's no waiting your turn. Catch the crop at its peak of ripeness . . . your ALL-CROP is ready.

The optional hydraulic header lets you follow uneven land, uneven crops, or pick up down grain, with a touch of the controls.

The 5-foot rubber-faced bar cylinder, matched exactly to cutterbar width, threshes the crop just as it grew in the field without bunching or slugging. Smooth-running, adjustable V-belts supply steady power for cutting, feeding, shelling, threshing and cleaning.

What new crops can you grow to fill the profit gap left by acreage allotments? The new model ALL-CROP gives you a choice of 106 grains, beans and special seed crops. With increasing seed demand, many of them are real profit-makers.

Select your best soil-building crop rotation, providing high-protein, meat-and-milk-making legumes as well as grains. The ALL-CROP harvester allows you a wider range of cropping systems to fit your family farm.

Ask your Allis-Chalmers dealer to show you the new A Series ALL-CROP harvester.

By J. F. "Doc" ROBERTS

LIVESTOCK farming, grass farming, fewer acres of cash crops and grain—all add up to a reduction in so-called surpluses. But, does this mean surplus meat in the not too distant future?

We have seen livestock surpluses in this country. We have killed little pigs, and in drought years we have slaughtered and mostly wasted great numbers of cattle. Milk has sold below cost of production, and wool, hides, fats, etc., have all seen times of surplus when they were hardly worth the cost of transporting them. Not a pretty picture, but is it necessary or probable under our present economy, population growths, better diets, etc.?

Geographically the Northeast has tremendous advantages in any livestock expansion program. The South is our greatest threat now. But in spite of all we are hearing about the South's "pasture all the year around," new breeding for heat resistant animals, ability to grow new corn hybrids to withstand dry heat, they still have a long way to come to equal the Northeast as a livestock producing area.

Disadvantages

Not many people go South in the summer time and see those dried up brown grasses which carry no food value and which are a constant fire threat, or how far apart they have to plant corn rows because of lack of moisture, or the dried up corn fields in August, or how their animals look and act during those hot, dry months. Anyway, generally speaking, our livestock comes out of our cold barns in better shape every spring than their livestock comes through their hot, dry summers every fall.

The western ranges are rapidly becoming unavailable as meat producing areas for consumers in the East. Population increases in the far West, in the mid-West, and on the ranges are resulting in the consuming of most of the meat they can produce.

Economic factors are becoming more and more difficult for livestock expansion. Land costs, foundation stock costs, transportation costs, labor costs and taxes are all on such a high dollar basis that just sitting back and letting little animals grow into big mature animals ready for breeding or sale has become, with most of us, an impossibility. We must do something else while they are growing.

New diseases, parasites, health regulations, etc., are also contributing factors in a slower livestock expansion than might be expected. Today we must have high producing cows; they in turn are subject to more troubles than low producing cows and the same illustration applies to highly bred meat animals. Of course these troubles are being overcome but they tend to slow up rapid expansion.

Good Animals Scarce

Livestock numbers will and should increase, particularly here in the Northeast. But, they will not increase as fast here or anywhere else as our pessimists are apt to think, or as fast as they could have some few years back. It costs no more to bring up a high producing animal, but it is worth more because it produces more and this is about the only way we can get away from the high costs of growing and maturing animals. This country has never produced a surplus of good animals; the surplus has always been

How Big Are Poultry Flocks ?

By L. E. Weaver

SOMETIMES when I am writing the items for this page I get to wondering about you who will be reading them. Are you mostly general farm owners with a lot of acres, but only one or two hundred hens, or are you the "commercial" men with several thousand layers? Should

L. E. Weaver

I write about the newest discoveries in the vitamin laboratories and so on, or just remind you of the seasonal chores that you might be overlooking; or should it be a mixture of both? That is what it has been for the most part, a little of both. Awhile ago Hugh Cosline and I decided to try to get an indication of the size of the poultry flocks of AA readers, and we put a request in the paper asking you to tell us five things; the size of your farm, how many hired men you have, how many layers you usually keep, how many broilers you grow each year. The response was sufficient, I think, to mean something. I would like to pause here to say 'thank you' to all who took the time and paid your own postage to send us the information. Exactly one of every five returns was from what I call a "commercial" poultryman. Of this group the smallest flock was 700 layers and the largest 3,000. The average size of all the group was 1,730 hens.

Four-fifths of the returns were from what I call "farm flocks." The two smallest were 100 layer flocks. There were three flocks of 300 layers each. All the rest were in between, the average size being 197. Not one backyard flock owner reported, which was not surprising since we asked about acres, hired men and so on.

Few Broilers

Broiler growing was not very important on these farms. Only four reports showed any at all, and then only small lots. The number of hens didn't have much relation to how many hired men were kept. No farm had more than one hired man and those were the ones with big acreages. I imagine they were dairy farms.

If any conclusion of value can be drawn from such a sketchy survey, I think it is that we had better continue to emphasize the practical, but spice it up with some of the more interesting new angles from time to time.

From another source I recently got

some authentic figures on large (commercial), medium (farm flock) and small (backyard) flocks in New York State. The figures came from the 1940 census report and were brought together by Dr. Kearls in his Ph.D. thesis at Cornell. Chickens were kept on 100,000 farms in New York State in 1940. Only 8,000 of those farms kept flocks of more than 400 hens. I know that 400 hens don't make much of a "commercial" flock, but to simplify the discussion let's call this 400 plus the commercial farms. Now here is a rather astonishing fact: more than

half of all the hens in the State (53% to be exact) were on those 8,000 farms. All the other 92,000 farms together kept fewer hens than were on those 8,000 farms. It is easy to see that if we are considering hens, and not owners of hens, the commercial group is most important.

Many Small Flocks

Now let's take the farms with 100 to 400 hens, our middlesized group. There were 23,000 such farms—almost three times as many as of the commercial group, and they owned a total of 4,000,000 hens against 7,000,000 in the commercial flocks—so they really are a big factor in the egg-producing job in the state.

Last of all comes the group with fewer than 100 hens. I was astonished at the number—69,000. The group rep-

resents a lot of people, even if they own only a few hens each.

So we are right back where we started. Since what is written or printed is read by people, and not by hens, as far as we are concerned it rather looks as though a paper published primarily for everybody who is rural-minded should devote a lot of its poultry space to the things of most interest to the small and middle-sized poultry owners, because there are so many of them. I plan to do that!

Some chick orders are being cancelled. The present low price for eggs is in part the result of starting too many chicks late last spring.

There are other reasons also for the low egg prices. Pork is more plentiful and cheaper, and probably that has re-

(Continued on Page 20)

A word from the man who produces SUNNYBROOK Chicks

Regardless of ups or downs, people in this great country of ours are going to continue to eat. They are eating more poultry and eggs than ever before and they will continue to do so. Poultrymen in the East are producing the highest quality of eggs in the world for the finest market in the world. Poultry prices are steadily rising. So do not let fear, inaction and hesitation keep you from a wholesome, pleasant and substantial means of living.

For all around sound and secure investment—assured results and pride of ownership, as well as freedom from those money-losing illnesses, so common in ordinary cheap baby chicks, there are no baby chicks on the market that can equal Sunnybrook Chicks for 1950, for we have, beyond all doubt, the greatest baby chicks ever grown.

Although our hatching facilities are running at full capacity, we have made plans for those of you who have hesitated in buying your baby chicks for this year. We have some of the finest Started Pullets you have ever seen, 4-6-8-12 weeks of age up to ready-to-lay, as well as some dandy Started Capons 4-6-8 weeks of age—all astonishingly low priced. We can be of great help to you, so you have not lost a day. So, may I urge you to start right this year—buy Sunnybrook. We have all the popular breeds.

Let me send you our latest picture story of Sunnybrook Poultry Farms. Just drop me a card or better yet, phone me. If you want to order Chicks or Started Pullets or Capons and if the order is for \$100 or more, reverse the telephone charges—I will gladly pay it.

My best wishes for the best poultry year you have ever had.

duced the demand for eggs somewhat. Then, too, not so many eggs are going into incubators now. They are going on the market and adding to the supply, and the price-support level now is 75 rather than 90 per cent.

It doesn't take long to get the industry "back to normalcy" as a rule, so I expect that things will be looking a lot better by mid-summer. What I hope will not happen is that these folks who are cancelling chick orders now will reconsider and order again in June. A lot of late-hatched pullets coming into heavy production a year from now could put us back in the same surplus situation we are in now. It has happened before.

The smart poultryman will start as many chicks as he has room for, no less, no more, and he will start them early.

* * *

THE names of poultry diseases are often long and hard to pronounce. They usually are shortened to a nickname after they have been around long enough for folks to feel on intimate terms with them. Coccidiosis, for example, is often called Coxy, and Laryngotracheitis has been cut down to Tra-cheitis. It seems to me that Lymphomatosis has been around long enough that we might call it Lympho now. Probably I am not exactly correct when I say that Lymphomatosis is the same as Leucosis, or Leukosis, as it is sometimes spelled, but for all practical purposes they both refer to that complex of diseases which includes fowl paralysis, big livers, iritis and various tumorous conditions. Lympho would be an easy handle for practically the whole group.

From time to time I hear comments that indicate that it seems funny to the speaker that after all the years Lympho has been around, and after the thousands, probably millions of dollars' loss it has caused, so little is known about the disease or how to fight it. No cures are known, no vaccines have been developed.

All I can say is that this discouraging situation has not continued because of any lack of effort to do something about it. Many state experiment stations have been working at a solution for years. The federal government established a laboratory in Michigan ten years ago that has done little else but study this number one poultry killer—Lympho. Their tenth annual report contains some hints that they may be getting somewhere at last. Here are some of the highlights:

For a long time they have suspected that Lympho can be transmitted through the eggs to the chicks, but the evidence they gave has not been too conclusive. During the past year they were able to find the infection in chick embryos from apparently healthy mothers. They feel, therefore, that not

only is it possible for the infection to be transmitted through the egg, but the carrier hen may not be affected herself, the same situation that we have with pullorum disease. Now, as a result of that discovery they are trying to do two things: (a) devise a test that will detect the carrier hens, as the blood test detects hens that are pullorum carriers; (b) develop a method of fumigating the inside of the incubator while chicks are hatching so that infected chicks will not spread the disease to healthy chicks.

They have shown also that chickens of all ages up to 600 days may be affected, but that some family lines don't show it until they are much older than other lines. The use of old hens for breeders is one way, therefore, of cutting down the number of young pullets that will die from Lympho infection. That, of course, is not a new idea.

One statement in the report seems to me to be particularly significant. It says, "Thus, if this interpretation is correct, most, if not all, chickens appear to be infected with causative agents of Lymphomatosis early in life; subsequent development of the lesions depends upon host-environment-pathogen interactions." If that statement means what I think it says, then we may finally conclude that the development of an active case of Lympho is a three-way proposition. In order for the disease to appear in an acute form, three requirements must be met: 1. a chick that is susceptible; 2. an environment that is favorable to the development of the disease; 3. the virus that causes the disease.

The big "unknown" is the No. 2 requirement. Just what things in the environment can make it possible for the disease to get a start no one seems to know. However, I feel very sure that a good job of brooding will help the situation.

—L. E. Weaver.

—A.A.—

WATCH WATER SUPPLY WHEN MOVING PULLETS

On January 30, we moved 170 12-week old White Rock pullets from the brooder house to a 24'x24' pen in the laying house. As the days went by some of the birds began to look sick. On February 10 it was noted that approximately 25% of them looked like specimens used in advertising worm, blue comb, and coccidiosis cures. The remaining 75% seemed perfectly normal. Two birds were sent to the Massachusetts Veterinary Science department for diagnosis. Dr. Bullis reported that they either had an uncommon type of coccidiosis or had not had anything to drink for some time. The latter proved to be the case.

Two water pans were placed on the floor of this pen and some of the weaker birds had their heads dunked. By February 11 there was marked recovery.

ery and by the 14th all birds looked normal. No mortality was experienced.

The 24x24 laying pen was equipped with an automatic waterer—water pan on an elevated stand. In the brooder house the birds were accustomed to 5 gallon water pans set directly on the floor.

I was fully aware of the fact that young chicks sometimes have difficulty in locating the water supply but did not realize that this would occur as late as 12 weeks of age. Dr. Bullis informs me that this may occur even later in life.

Moral — don't take anything for granted in the chicken business.

—F. P. Jeffrey

—A.A.—

GO TO THE HEN, THOU SLUGGARD!

It is worth emphasis that hens are smarter than humans.

They are smarter about eating. They choose balanced diets of natural foods, eat heartily, and have good health and trim figures.

They are smarter about working. They work steadily, sing at their work, and accomplish more than humans.

They are smarter about living. They choose plenty of fresh air and sunshine, get sufficient sleep, and have relatively longer and healthier lives than humans.

They are smarter about life. They do not go in for wild isms, debilitating night life, do not coddle the drones, and set an example of community tolerance and peaceful existence.

Finally, they turn out a better product than humans. An egg is a wonderful achievement, one of Nature's great protective foods, full of vitamins and minerals and proteins, in a beautiful protective package, and easily digested by both sick humans and well ones.

Humans, who make a lot of health mistakes which hens don't make, might well compensate for some of their foolishness, by eating more eggs to improve their pep, their health, and their physical beauty.

This article pays tribute to the hen. Humans, in humility, should give attention to the fact that they are dumber than hens.—Pacific Rural Press.

—A.A.—

HOW I GREW 144 BUSHELS OF SHELLER CORN PER ACRE

(Continued from page 17)

necessary to produce a well pulverized and smooth seed bed, the kind that you like to have to plant your vegetable garden in. This usually means two diskings at different angles, once with the culti-mulcher at another angle and once or twice with a chain harrow.

We plant corn in 36 inch rows, try to have the kernels spaced 8 inches apart and about 1½ inches depth. The reason for the smoothness of seed bed is to attain uniform depth of seed.

The planting distances would not necessarily apply to all fields, the balance of soil fertility and plant population is a matter of judgment. If I have a field lower in fertility, I space the kernels further apart. I wish that I had planted a little thicker in 1949, as the size of ears showed that the ground could have stood closer planting and my yield would have been larger.

Keeping Ahead of Weeds

We cultivate only as much as is necessary to control the weeds, the important things being to get ahead of the weeds. Just when the first shoot makes its appearance, the ground being dry enough, we go over the field with a chain harrow to kill all of the weeds just starting and still not injure any corn. This holds the weeds back enough so that we can delay the first

regular cultivation until the corn is about 3 inches high. Then, using a narrow tooth next to the corn we can throw a little dirt in the row, which is the main place to control weeds.

Every cultivation after that, of which there are usually two, we throw as much dirt as the corn will stand against the plants. When the corn is about 18 inches high we stop cultivating as the plants will shade out the weeds.

The corn in the 1948 and 1949 contests were in the same field, the practices and fertilizer applications were the same, the exceptions being that lime was applied in 1949 and 1948 ground was fall plowed and 1949 ground spring plowed. The 1949 crop was absolutely weed free and the 1948 crop had a few weeds.

DeKalb 458 was used in 1948 and DeKalb 404 A which is about a week earlier was used in 1949. The 1948 yield was 128.45 bushels, shelled, which was within ¼ bushel of the state championship. The 1949 yield was 144.09 bushels. Of course the extreme heat had something to do with the increased yield in 1949. The crop was not bothered by drouth as it was on river bottom land.

I think that we can all feel assured that it now pays to grow corn in New York State to fit in our dairy program. Our yields being as good as the corn belt states mean that our cost of production is as low as theirs and there is a \$24 per ton difference from the time the corn leaves the Illinois farm until you receive it on your farm. In the operation of our farm this \$24 per ton means \$2,880.

Editor's Note—Mr. Metzner recently reported the above account of his experiences on the Rural Radio Network.

CLEMENTS BROS. FARMS CHICKS

DR. SALS'BURY'S Ren-O-Sal

Drinking Water Medicine

Given From Start Helps Chicks

Develop Better

Gain Weight Quicker

Lay Eggs Earlier

Ren-O-Sal's exclusive ingredient, 3-nitro 4-hydroxy phenylarsonic acid, helps chicks gain 14.8% more weight...lay eggs up to 15 days earlier. Birds feather-up faster, have better pigmentation. Use right from the start.

Controls Coccidiosis—larger doses prevent spread of cecal coccidiosis—at about 1c per bird treated. Buy at hatchery, drug or feed store. Tablets for drinking water or powder for feed. Dr. Salsbury's Laboratories, Charles City, Iowa.

When you need poultry medicines, ask for

Full or part time, protected territories, liberal commissions. W. D. Carpenter Co., Inc., Irving Ave., Syracuse, N. Y.

DEALERS wanted to sell popular low priced concrete silos. Territory protection and excellent commissions paid. Write giving full particulars to Haycorn Silo Co., P.O. Box 387, Binghamton, New York.

SITUATION WANTED

MARRIED Man desires farm job about April 1st. 25 years experience. Write P. O. Box 161, Fultonville, New York.

EXPERIENCED Agricultural School Graduate wants to rent or work on shares small, well equipped dairy farm. Donald Walter, Harriman, New York.

POSITION Desired: Cornell University, College of Agriculture graduate, farm reared, age 30, married and no children. I desire a position with a firm who can use me as an agricultural consultant. I have had practical experience in farming, management, labor supervision, marketing and accounting for farm businesses. References available. Reply Box 514-CO, c/o American Agriculturist, Ithaca, New York.

YOUNG married man wants position on Purebred Holstein Dairy to gain additional experience working with quality cattle. Five years previous experience, Agricultural graduate, references. Available late April. Robert Eklund, Laurens, New York.

SEED POTATOES

FOR SALE: Certified Essex Seed Potatoes. 1. They need no spray for blight. 2. Out yielded all varieties in New York Test—1947. 3. Out yielded all varieties in Pennsylvania—1948. 4. Out yielded Cobblers. 150 cwt. to the acre in the south—1949. 5. Booking now for spring delivery. Thompson Farms, Clymer, New York.

FOR SALE: Blight resistant seed potatoes: Essex, Placid, Virgil, Filmore, Ashworth, \$1.75 per bushel. Order now. Bernard Blinn, Phone 9-D, Candor, N. Y.

HONEY

HONEY: Delicious Old Fashioned Buckwheat New Crop. 5 lbs. \$1.25—6.5 lb. pails \$7.20 postpaid 3rd zone. 60 lb. cans \$7.20 F.O.B. Sold by ton or pail. Howland Apiaries, Berkshire, New York.

CLOVER honey: Five pound pail \$1.45. Six pails \$7.00 prepaid third zone. Sixty pounds clover \$8.00 F.O.B. Sixty pounds buckwheat \$5.00 F.O.B. John Mosher, Moravia, New York.

MAPLE SYRUP

FANCY Vermont Maple Syrup \$5.50 gal. del. 3rd zone. Sugar on order. Franklin Hooper, Johnson, Vt.

PURE 1950 Maple Syrup. We use latest methods and equipment to guarantee the best syrup. Try some and you will order more. \$5.00 a gal. \$2.75 $\frac{1}{2}$ gal. Any quantity. Edgar Gould, Shelburne, Mass.

PURE Vermont Fancy Maple syrup \$5.00 per gal. Post paid third zone. E. J. Urie, West Glover, Vt.

Strathbar Major's Fairy, Grand Champion Ayrshire cow at the 1950 annual Pennsylvania Farm Show at Harrisburg, won the same honor in 1949. She was exhibited by Cuthbert Nairn of Blackwood Farm, Douglassville, Penna. Classified Excellent, the 8½-year-old produced at 7 years of age 13,702 lbs. of 4.1% milk and 561 lbs. of fat. Bred by Herb Dodge of Strathbar Farm, Frankfort, N. Y., she was purchased for \$2,000 at the Strathbar milking herd dispersal in 1948.

DOWN THE ALLEY

(Continued from Page 18)

made up of poor animals.

The Northeast can grow more good grasses, use more efficiently its already available grasses, grow more corn, and with its diversified farming slowly produce more and better animals and create again the kind of agriculture on which our great Northeast was built.

This is what I mean: Every agricultural trend today is toward the efficient machine-age good farmer. This is the death knell to big or little poor farmers and that in turn probably will be the eventual end to subsidies and surpluses. But, the efficient good little farmer has no equal with his good little herd of cows, flock of sheep, or few sows—and never will have. The big boy may be

CHINCHILLA

CHINCHILLAS—The world's most valuable fur animal. Chinchilla raising is highly profitable and enjoyable. Inexpensive to feed. No odors. Highest quality, registered breeding stock, and complete information obtainable from Great Bay Chinchilla Farm, Durham Point Road, Durham, New Hampshire.

MISCELLANEOUS

A LAND BANK Mortgage gives extra safety and extra service. Long time to pay. Low interest. Other advantages all geared to meet farmers' credit needs. Without obligation write for further details to Federal Land Bank, 310 S. State St., Springfield 2, Mass. Serving New England, New York, New Jersey.

POP CORN, Thompson's Original Bear Paw, white, hullless, tenderest corn you ever ate. 35c lb. 5 lbs. or over 30c lb. postpaid. Glenn Thompson, Johnson, Vt.

PREVENT horns painlessly. Rub D-Horn-R direct from tube onto horn buttons. No grease. No mess. Won't rub off. Safe, easy, painless. 15 treatment tube \$1. ASL, Box 232-CP, Madison 1, Wis.

LADIES DRESSES \$1.09. Shoes \$1.49. Women, children's. Wool Sweaters 99c. Rubbers, boots. Men's work clothing. Shoes. Shirts, underwear. coats, mackinaws, housedresses, hose, skirts, blouses. COLOR FILM. 116, 616, 620, 120, 127, 35mm. Free literature. Sample Roll—25c. More Film, Hemlock, N.Y.

ENLARGEMENTS of your favorite snapshots 8x10, 3 for \$1. Send negatives with remittance. Willis D. Shook, Sewickley, Penna.

able to produce more potatoes on more acres cheaper, but he cannot mass produce livestock with anything like the same results as the good little livestock farmer because animals will never respond en masse as they do as individuals. Little flocks and little herds made our Northeast farms and farm families possible. Are they on their way back?

—A.A.—

UIHLEIN BUYS MAJOR PART OF CLUB FARMS

HENRY UIHLEIN, owner of Heaven Hill Farm at Lake Placid, New York, one of the country's foremost breeding establishments for purebred Jersey cattle, has purchased and added to his holdings the major portion of the land and buildings comprising the Lake Placid Club Farms.

The purchase gives Heaven Hill Farm a total of 1,600 acres. All tillable land will be used for pasture, hay, grain and the production of certified and foundation stock seed potatoes. Favor R. Smith, manager of the Lake Placid Farms from 1935 to 1947, has been engaged to manage Mr. Uihlein's enlarged holdings and herd of 170 purebred Jerseys. They plan to have 100 milking cows. Mr. Uihlein purchased the initial part of Heaven Hill Farm in 1942 and since then Heaven Hill stock has been sold all over this country and Canada and frequent shipments have been made to Central America.

—A.A.—

PRESERVATIVES FOR GRASS SILAGE

(Continued from Page 10)

time element. Last fall, I saw two lots of silage at Montrose, Pa., on a farm which has been operated on an experimental basis by the Pennsylvania State College of Agriculture. One lot had sulfur dioxide added and in the other, grain was used as a preservative. Both lots were excellent. There was not the slightest objectionable odor.

The silage where sulfur dioxide had been used was greener and a test on 10 cows which ate this silage compared to 10 others that ate the silage containing the grain showed that the ones eating silage with the sulfur dioxide produced slightly more milk. Whether or not the increase was significant remains to be seen from further trials,

AN OPPORTUNITY

WANTED: A young, experienced dairy farmer to operate on a share basis a 50-75 cow dairy farm in Dutchess County, N. Y. The cows are first-class grade and purebred Holsteins, with some Guernseys. There is an excellent house with all modern conveniences, pleasantly located. The farm is fully equipped with 3 tractors, 3 trucks, and all other modern equipment, with up-to-date and handy buildings. The land is high in fertility and in fine condition.

This is an interesting and attractive proposition for the right man. When replying give all details as to age and experience. Address reply to Box 1, American Agriculturist, Savings Bank Building, Ithaca, N. Y.

but certainly so far as I could see, and apparently so far as the cows could judge, the silage with sulfur dioxide was equal or better than the other.

There is the possibility that continued long-feeding of heavy amounts of this silage containing sulfur dioxide might show harmful effects on the cows. However, there is no reason to expect that it will. In general, state colleges in the Northeast are willing to say that this method shows promise but they are not willing to give it a whole-hearted recommendation until they have experimental evidence to back up their statements.

—H. L. Cosline

OLD THINGS HAVE *Charm!*

By LOUISE PRICE BELL

SOMETIMES it seems a bit discouraging when many pieces of furniture are needed and the budget is temporarily, at least, in a growling state! Such times are the ones to give some thought to the charm that old things can have . . . the way they can be fitted into our homes to make them livable and attractive, and perhaps radiate a charm that new pieces cannot.

Shown here are two rooms that are simply done, at very little expense. You can see for yourself what the "old things" do to create charm. The little dressing-room was added to a bedroom to give space and a storage-drawer-wall with a usable top. The ceiling is wallboard, neatly divided into squares with wooden bats.

The windows are low and treated with sheer glass curtains of the same fabric as is used at the dressing-table front. The painted wooden floor is a leaf-green, and a lovely old grandmother-rocker makes a wonderful spot for mending or reading. Everything except the floor is bone-white. It's a room that a teen-ager, her older sister, or even her mother, would love.

In the other room an old Franklin stove is the center of interest, and another old Boston rocker, antique brass kettle holding wood, and quaint silhouettes of ancestors tie in with the stove in creating a homey atmosphere. A quaint colorful chintz, such as

Grandmother may have worn, hangs at the windows. A Franklin stove, used in this manner, can turn a non-workable corner into one of warmth and cheer. A backing of brick is not only a safety idea, but also forms a suitable and attractive backdrop for the pseudo-fireplace.

If you have some old pieces similar to the ones shown around your house, or in the attic, dust them off and work them into your decor; they're sure to add charm to the spots in which they are used.

If you have an old Franklin stove, and have always longed for a fireplace, why not use this idea? The backing of brick not only creates the illusion of a fireplace but is a good fire-prevention idea. The chintz curtains, brass kettle and old rocker all add to the homey atmosphere.

(Morley Baer photographs)

The lovely old grandmother-rocker gives added charm and coziness to this bedroom and affords a wonderful spot for mending or reading.

LOOK ON the grocery shelves and what do you see? A bewildering array of detergents, soaps, soap-powders and special purpose cleansers. Many are new and no two are exactly alike as to contents. Small wonder that the homemaker feels a little uncertain which one to get.

Let's take soaps first since they are familiar ground. They group into (a) neutral [unbuilt]—for fine laundry, hand dishwashing and light cleaning, and (b) strong [built by adding borax, washing soda or other compounds]—for very soiled clothing and heavy cleaning. Where water is soft, soaps or soap compounds still are most desirable for cottons and very soiled work clothes.

Our standard in how much soap to use has been how much suds it will make. Hardness of water often re-

quired extra softeners and made a problem of rinsing out suds. In fact, so accustomed are women to using suds as a sort of measuring stick that manufacturers, even with the new detergents, made their product yield suds.

Wartime shortages gave great im-

penetrate grease, soil or fabrics more easily; they do not form lime soap curds; they (the sudsing types) suds freely in hard water, soft water, salt water or in acid solutions, and they work in hot, warm or cold water.

They, too, fall into the classes of un-

detergents removed soil in dish-washing better than others with abundant foam.

Most of the unbuilt detergents, intended for light cleaning, fine laundry and hand dishwashing, suds voluminously. They are used for washing china, glassware, silks, rayons, woolens, nylons and other fine fabrics. Being neutral, they are kind to woolens and keep fast colors unclouded because they leave no in-

soluble scum. Also, being neutral, they are kinder to the hands than are the built detergents. Naturally, a cleansing agent strong enough to remove greasy dirt from clothes will remove oil from one's skin, but a good hand lotion quickly replaces this oil, or, given an hour or two, Nature takes care of it herself.

Instructions on the package indicate how much of the detergent should be

(Continued on Page 26)

Let's Talk About DETERGENTS

By GRACE WATKINS HUCKETT

tus to the new cleansers, the detergents, which had long been used in industry but not adapted to home use. Now the big companies make both soaps and detergents, some of them putting out both unbuilt and built types.

Recognized advantages of the soapless detergents are that they are efficient wetting agents, making water

built, for fine laundry, and built, for heavier uses. Hence in trying a new one it is important to read the label and see for what uses that particular detergent is intended. Some make suds, while others do not. But do not be deceived by this, for suds do not clean, according to G. J. Hucker of the N. Y. State Experiment Station, whose washing tests proved it. Some of the sudsless

Enjoy Maple Treats

By GRACE WATKINS HUCKETT

MAPLE flavor is one of nature's kindest gifts to mankind. For those fortunate enough to have maple sugar or sirup to use in cooking, the following recipes will add much pleasure to their use:

MAPLE NUT MUFFINS

2 cups flour 1 cup milk
1/2 cup maple sugar 1 egg
1/2 teaspoon salt 1/4 cup shortening, melted
3 teaspoons baking powder 1/4 cup chopped nuts

Sift dry ingredients into mixing bowl. Break egg into small bowl, beat until very light and add milk. Stir egg and milk into dry ingredients, add melted shortening and nuts and stir just enough to blend ingredients. Pour at once into greased muffin tins and bake 20 to 25 minutes at 400° F.

MAPLE SYRUP SAUCE

1 cup scraped maple 2 cups water
sugar 3 teaspoons cornstarch
1/2 teaspoon nutmeg

Melt the sugar in 1 1/2 cups hot water until it boils. Dissolve the cornstarch in 1/2 cup cold water, pour it in gently, always stirring to prevent lumps. Add nutmeg, if desired; cook 5 to 8 minutes. Delicious on puddings. Makes 2 1/2 cups sauce.

MAPLE CUSTARD PIE

5 eggs 4 cups milk
1 cup maple sirup Pie-crust, unbaked

Heat milk almost to scalding; add maple sirup and eggs beaten together until well blended. Pour into a deep 9-inch pie pan lined with unbaked pie crust. Bake at 450° F. for 10 minutes; reduce heat to 325° F. and continue baking until custard is firm when touched lightly in the center with the finger, about 30 minutes.

For variety: Chopped homegrown nut meats may be sprinkled on top of the custard before baking.—H.R.

MAPLE WALNUT CREAM PUDDING

1 cup maple sirup 2 eggs
2 cups milk 1/4 teaspoon salt
2 tablespoons cornstarch 1/2 cup chopped walnuts
1 cup cream

Scald 1 1/4 cups milk with the maple sirup, in the top of a double boiler. Combine the remaining milk with the

cornstarch and salt, and add gradually, stirring constantly, to the hot mixture. Cook 25 minutes, then add this mixture to eggs slightly beaten. Cook 5 minutes longer. Pour into the serving dish and sprinkle with chopped nuts while the pudding is still hot. When cold, cover with the cream, whipped stiff, and serve. If cream is not available, whip 1 can chilled evaporated milk. Serves 4.

PUDDING SAUCE

2 cups milk 1/2 teaspoon salt
3/4 cup maple sugar 1 beaten egg
1/3 cup flour

Scald milk, salt and sugar. Stir flour smooth with egg. Add to milk and cook in a double boiler for 15 minutes. Serve over cake, sliced bananas, stewed prunes or dates.

MAPLE SIRUP FRIED CAKES

1/2 cup maple sirup 1 1/2 teaspoons soda
1/2 cup white sugar 3 teaspoons baking powder
2 eggs 1 teaspoon salt
3/4 cup THICK sour cream 1/4 teaspoon nutmeg
1 1/4 cups sour milk 1/4 teaspoon ginger
5 cups bread flour 2

Beat maple sirup, sugar and eggs together; sift flour, soda, baking powder, salt and seasonings together and add alternately with the cream and milk to the egg mixture. Put in a cool place for a half hour, roll, cut, fry quickly at 370° F. Makes 3 to 5 dozen fried cakes according to size.—E.L.A.

MAPLE WALNUT BARS

1/2 cup shortening 1 cup nuts, coarsely cut
1 cup maple sugar (soft) or 1/2 cup dates and 1/2
2 eggs cup nuts
3/4 cup sifted flour 1/2 teaspoon baking powder
1/4 teaspoon salt

Cream shortening and sugar together. Beat eggs. Add to sugar and shortening. Stir. Sift together flour, baking powder and salt. Add flour mixture, nuts and dates to creamed mixture and stir well. Pour into well-greased 8"x8" pan and bake in moderate oven 350° F. for about 30 minutes. When cool, cut into bars about 1" wide and 4" long. Roll in confectioners' sugar just before serving.—E.M.C.

MAPLE SYRUP CAKE

1/2 cup butter 1 teaspoon vanilla
1/4 cups maple sugar 1/2 teaspoon salt
3/4 cup milk 2 cups flour
3 eggs separated 2 teaspoons baking powder

Cream butter and sugar, add egg yolks and beat until creamy. Sift flour, baking powder and salt; add to creamed mixture alternately with milk and vanilla mixed together. Fold in beaten egg whites. Bake in two nine-inch layers at 360° F. for about 25 minutes. Very good with whipped cream frosting.

MAPLE CREAM FUDGE

2 cups soft maple sugar 1 teaspoon light corn sirup
1 cup brown sugar 1/4 cup butter
1 cup sifted white sugar 1/2 cup marshmallows
1/4 teaspoon salt 1/2 cup nuts, chopped
2 cups cream 1/4 cup whipped cream
2 teaspoons vanilla

Boil the sugars, sirup and salt to soft ball stage; cool; beat in other ingredients and continue beating until thick and creamy and the mixture loses its gloss. Pour into buttered pans; chill, cut into squares.—E.F.

MAPLE APPLES

1 cup maple sirup 6 tart apples, pared and
1 1/2 cups water cored

Heat sirup and water to boiling and add apples. Simmer apples gently, turning frequently to insure even cooking. When soft, remove apples from saucepan. Cook liquid until thickened and pour over apples; serve either warm or cold with cream. Serves 6.

MAPLE TAPIOCA CREAM

2 egg yolks 1/2 cup maple sugar
4 cups milk 1/4 teaspoon salt
1/3 cup quick cooking tapioca 2 beaten egg whites

Mix egg yolks with 1/2 cup milk in top of double boiler. Add tapioca, 1/4 cup, maple sugar, salt and remaining milk. Cook 12 minutes. Beat egg whites with 1/4 cup maple sugar, fold into tapioca mixture. Chill and serve. Serves 8.

—H. E.

Douglaston Woman Edits Prize-Winning Recipes

Twins Carl and Neil Foehrenbach give their mother Mrs. Frank Foehrenbach, of Douglaston, N. Y., a helping hand in editing the final draft of her cookbook "Reunion Recipes." Most of the recipes are prize winners and are contributed from all over the country. Cookery expert Mrs. Foehrenbach says that it takes more than practice to be a prize-winning cook. "Good ingredients are very important in all branches of cooking," she says. "When you bake at home, for example, you have to use a good yeast—one that's fast and lively. Otherwise your results are likely to be below par. I, for one, have always used Fleischmann's Yeast because I know it's got plenty of pep and action. It's one yeast I can depend on for finest results."

That's right! Prize-winning cooks prefer Fleischmann's Yeast to all others.

GIFT TOWELS and PILLOWCASES

Feels Years Younger

"Sleepless nights due to caffeine in coffee had me feeling like an old woman—till I switched to POSTUM. Now, with 8 hours sleep every night, I feel — and look — years younger!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine. So, while many people can drink them without harm—others, *caffeine-susceptibles*, suffer nervousness, indigestion, sleepless nights. POSTUM contains no caffeine—nothing that can possibly keep you awake!

MAKE THIS TEST: Buy INSTANT POSTUM today—drink it exclusively for 30 days—judge by results!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

Feels Years Younger

Are sleepless nights and nervousness acting as a drag on your career?... making you feel old and worn out? Then, read this encouraging statement by a man who feared his advancing age—until he made an important discovery:

"Nights of sleepless tossing and turning made me feel old and tired—unable to meet the business competition of younger men. But my doctor put the blame on 'coffee nerves' and suggested I switch to POSTUM. Now, with nervousness gone, I get 8 hours sleep every night and I literally feel years younger!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine. And caffeine is a drug—a stimulant which acts upon the brain and central nervous system. Also—in susceptible persons—caffeine tends to produce harmful stomach acidity. So, while many people can drink coffee or tea without ill-effect, others suffer nervousness, indigestion, sleeplessness. But POSTUM contains no caffeine or other drug—nothing that can possibly keep you awake or upset your nerves!

MAKE THIS TEST: Give up coffee—give up tea—drink POSTUM exclusively for 30 days—and judge by results! Ask your grocer today for INSTANTPOSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

School District Centralization

(Continued from Page 6)

contracts with the central district on which they were voting—would be encouraged to stay out of the central district. Wealthy districts would often likewise vote to stay out in order to prevent any increase in their tax rates, and would thus deprive the centralization as a whole of taxable property without which the remaining districts could not carry the added cost of centralized schools.

To make sure that the opinions of the separate districts—including the opinions of rural voters as contrasted with village voters—are not overlooked, the Department has for many years gone beyond the law in the procedures it has set up. Specifically, it has required petitions for a proposed centralization before making a final decision on the districts to be included. These petitions have been tabulated district by district. Unless they have shown a majority of the total number of qualified voters in the rural districts involved to be in favor of the proposed centralization, the Department has declined to submit the proposal for official vote.

As to the wishes of voters in single districts, if the petitions from any single district have failed to indicate the likelihood of majority approval in that district, the necessity for including the district in the centralization has been carefully weighed. Districts not favoring centralization have been retained in the proposals only if and when it has been apparent that they were important to the success of the proposed centralization and that majority opinion in the area as a whole was in favor of their inclusion.

In connection with this first objection to procedure—namely, the objection to over-all district voting—it may be pertinent for me to speak of the provision in the present statutes under which the voting on a proposed centralization must be done at one central polling-place. The Department is aware that this requirement may in many cases work a hardship on voters living at a distance from the polling-place. It is also aware that the necessity for

naming a central polling-place may give rise to the suspicion that the polling-place has been selected to favor the voters of a particular part of the area. With these matters in mind, the Department is now working with representatives of the State Grange in the hope that amendments to the law may be devised which, without sacrificing the advantages of the present provisions, may nevertheless remedy some of their disadvantages.*

Another objection to the present centralization procedure is that the Commissioner of Education has final authority to decide whether or not a given district or group of districts shall be included in the centralization which is to be voted on. Obviously, this decision must be made by someone. The essential question is as to whether the making of it shall be the responsibility of the State agency whose business it is to see that the most constructive possible arrangements are made for the education of the children of the State, or whether the decision shall be entrusted to some other agency.

I should like, in conclusion, to tell you as clearly as possible exactly where the Department stands:

Ordered by Legislature

The State Education Department understands itself to be under legislative mandate to promote the reorganization of common and union free school districts throughout the State, until all these districts have been soundly reorganized. This mandate is expressed, first, in the basic law governing centralization procedures; second, in the various legislative provisions which over the years have given special State aid to central districts, beyond the aid available to any other types of school district organization; and third, in the approval given by the Legislature to the 1947 report of the Joint Legislative Committee on the State Education System, setting forth a Master Plan for school district reorganization throughout the state. The third part of this mandate—the Master

LET'S TALK ABOUT DETERGENTS

(Continued from Page 24)

used in water of average hardness. When mild alkalies or other stronger cleansers are added to "build" a detergent, then we get extra cleansing power suitable for heavily soiled garments or for heavy cleaning. Some of the built detergents are suitable only for heavy cleaning or family laundry; some for dishes, glassware, kitchen or bathroom fixtures, heavy cleaning or farm laundry, but not for fine laundry; others are all-purpose and can be used for fine as well as for heavy duty laundry; still others are especially for automatic dishwashers.

Since the electric dishwasher is becoming more and more a part of kitchen equipment, it is well to know the detergents recommended to use in it. Calgonite is made of Calgon, a complex phosphate water softener with an alkali added which makes Calgonite too strong for hand dishwashing. This detergent prevents film formation and removes film deposited by other washing compounds. Electra-Sol has been designed especially for use in electric dishwashers. Chat, a liquid detergent, may be used also for hand dishwashing.

It is necessary to read labels carefully also when using general house-cleaning compounds. Many are designed as water softeners or soap-savers; some have added cleaning action. Many

are not detergents but are aids thereto. For instance, Mel'O is classified as a general cleaner with softening action; Dic-A-Doo is for painted surfaces, kitchen and bathroom fixtures—and so on.

For your convenience and ready reference here are names of a few detergents, grouped according to their uses:

For Fine Laundry, Hand Dishwashing and Light Cleaning: Breeze, Dif, Dreft, Glim (liquid), Savex, Swerl, Tish, Vel.

For Family Laundering and Heavy Cleaning: All, Fab, Fun, Spin, Surf, Tide, Zero (liquid). All, Fun, and Spin are suds-controlled, for use in automatic washers.

For Softening Water without Forming Insoluble Precipitates: Calgon, Phosphotex, Hommel Softener, Tex, Quadrafos.

For Electric Dishwashers: Calgonite, Electra-Sol, Chat (liquid).

For General Household Tasks: Mel'O, Boon, Dic-A-Doo, Sing, Noctil, Spic-and-Span, Climalene, Soilax (treated to be easy on hands).

For Miscellaneous Uses: Woolfoam—for woolen materials; Diaperwite—for diapers; Aimcee Rug and Upholstery Cleaner, for rugs and upholstery; Carbona Soapless Lather for laundry, rugs, upholstery.

Even Upon the Cross

By Edith Horton

Compassion is the word
Most beautiful of all,
Like music faintly heard,
Like golden leaves that fall.

Compassionate was He
Who walked so long ago,
Beside the little sea,
Hearing a far wind blow;

And when He pressed the moss
Upon Golgotha's hill,
Even upon the cross,
He had compassion still.

Plan—clearly implies that no district unable by itself to provide a sound educational program is to be left out of an eventual plan of reorganization. The mandate further implies that no district whose financial help is needed to make the reorganization of its neighboring districts successful is to be exempted from inclusion in the ultimate plan.

The State Education Department accepts this mandate willingly, because it is thoroughly convinced that soundly planned school centralizations offer the first and clearly essential step toward bringing to rural and village boys and girls educational opportunities on a par with those open to boys and girls in the cities.

At the same time the Department recognizes that the 20 per cent of the State's rural areas which still remain to be centralized present problems more difficult than most of those which have been encountered in the 80 per cent of the area already reorganized. These problems grow in part out of the fact that earlier centralizations have left many isolated districts which it is now difficult to unite with any established centralization or with new centralizations.

Will Consider Rights of Minority

The Department is conscious that in what remains to be done to bring about sound district reorganization, the strong personal concerns and opinions of individual citizens will continue to be of great importance. The Department will give the fullest consideration to these concerns and opinions, whether they are expressed by most of the voters in a proposed centralization or only by a minority group. The Department will, nevertheless, continue to regard as its ultimate responsibility that of making the best possible educational provision for all the boys and girls of the State. For the young people in the areas that have not yet been centralized, this will mean moving forward, year by year, with the continued support of our citizens, toward the best plans of local school district reorganization that we know how to devise.

*A bill incorporating such amendments was introduced by Senator Griffith and Assemblyman Milmoie in the current session of the legislature.—Ed.

—A.A.—

PREVENTS MARRING THE WALL

The next time you hang a picture on your newly papered wall, place a thumb tack in each corner of the back of the frame. This holds the picture away from the wall far enough to permit circulation of air. It also will keep the dust from collecting and marring the wall. If all the pictures are hung in this way, they can be moved at any time without leaving disfiguring marks where they have been.—B. C.

Today in
Aunt
Janet's
Garden

I Guessed Right!

NOW THE National Garden Bureau announces the ten best sellers among flower seeds—and their top three exactly coincide with the three which for years I have considered the easiest for busy farm women to grow! They are petunias, zinnias and marigolds, as you might suppose.

The other seven on the Bureau's list—made up from a survey which it conducted—are asters, sweet peas, snapdragons, nasturtiums, portulaca, annual larkspur and sweet alyssum. It is interesting to know that petunias, zinnias, and marigolds originated in one of the Americas, petunias in the Argentine, zinnias and marigolds in Mexico. They were discovered in the wild forms, seeds collected and taken to Europe where the hybridists improved the forms enough to introduce into home gardens.

Hybridists are still at work. Just

compare the petunias listed in today's catalogs with the spindling magenta or white of the near-original forms and see how far we have come. We now have all the colors, except real yellow and there are rumors that soon we'll have that. The really red petunia, Fire Chief, new this year, is a great achievement for the patience and persistence of the hybridists.

Also, the fine forms available in zinnias and marigolds are such an advance over those I remember from my childhood!

Perhaps the two most modest of the Bureau's list of ten best sellers are the portulaca and the sweet alyssum—neither of them a flower show beauty, but oh, so valuable in flower borders. After bulb foliage has faded, the portulaca is ideal, with its shallow rooting system, bright colors and pleasing foliage, even until hard frost.

If an artist were commissioned to create a white flower ideal for edging borders, blooming all season to frame and enhance the beauty of other flowers while seldom drawing attention to itself, he could probably do no better than sweet alyssum. My own experience says no to the old form, maritimum, because it grows straggly. The smaller, neatly mounded forms are much tidier.

For Smart Styles
—SEW

No. 3515. A topper to top everything! This one comes with a gracefully flared back, and two dog-eared pockets for front interest. Sizes 12-20. Size 16, 2½ yards 54-inch.

No. 2141. Notice the deft detail in the collar, cuffs and scalloped front closing . . . the flattering way the skirt throws its soft flares forward. Sizes 14-20; 36-48. Size 18, 4 yards 35-inch.

No. 2137. Youthful cotton charmer has its shoulders buttoned for comfort, large patch pockets . . . and best of all, so easy to make! Sizes 12-20; 36-42. Size 18, 4½ yards 35-inch.

No. 2121. Adorable child's dress buttons down the back, and has an adorable flapper duck applique right in the front! Panties and applique included. Sizes 6 months, 1, 2, 3. Size 2, dress, 1½ yards 35-inch; pantie, ⅝ yard 35-inch.

THE YOUTH'S COMPANION

The Craigstone Meteorite

By CHARLES M. SHELDON

FOREWORD

In Chapter I of this story taken from the YOUTH'S COMPANION of June 1892, young, poverty-stricken Professor Craigstone tries to buy a fallen "star" from Farmer Bent, upon whose farm the meteorite fell. The farmer finally agrees to let him have it for \$450.00, if he can raise the money before another buyer appears.

CONCLUSION

IT WAS NOON when the professor reached home. He hurried to the president's house and told the story of his attempt to buy the meteorite.

"Four-hundred-and-fifty-dollars!" exclaimed the president, as if each word astounded him. "Im-possible! The college cannot do it!"

"But, sir, the stone is worth two or three times that, I assure you. Think of the glory of having such a specimen! There is nothing like it in America."

"Impossible! We haven't five hundred dollars to give for anything."

"Then do you refuse, on behalf of the college, to purchase this stone?"

"Yes, sir, so far as my authority goes, I do. And it would be useless to expect any other decision from the trustees."

"Doubtless," replied the professor, and rushed over to his own house.

"Belle, I am going down to Coleridge again this afternoon. I can't stop to tell you all about it now. No, I'm not hungry. I'll get something on the road if I am. Good by!"

The professor's little wife, with cheerful confidence in her learned husband's ability, kissed him goodbye, and watched him affectionately as he hurried down the street.

"He's only a boy yet. How soon he forgets the four hundred and fifty dollars we owe!" She watched him thoughtfully until he went around the corner.

There was one man in Wrayburn who understood Craigstone better than any other. This was the banker, Mr. Thurston. He had more than once interested himself in scientific matters for the professor's advantage. To him Craigstone went, and after telling his story briefly, boldly asked him for the loan of four hundred and fifty dollars to buy the meteorite on his own account.

"It is quite a sum," replied Mr. Thurston. "Are you sure the risk is well taken?"

"Yes, sir. I have no doubt of it. The specimen is exceedingly valuable."

"You have security for such a loan?" asked Mr. Thurston, curiously.

The professor colored deeply, but he spoke frankly.

"To tell the truth, if you let me have the sum it must be as a pure favor and nothing else. I have nothing whatever to offer as security. In fact, I am already just four hundred and fifty dollars in debt."

Mr. Thurston smiled, wheeled round his chair, and wrote out a check for four hundred and fifty dollars.

"Get it cashed here. I never did such a thing before, but I'll risk it this time.

BOSTON, THURSDAY, JUNE 23, 1892

Professor, there ought to be luck in stars!"

Professor Craigstone was too much moved to say a great deal. He cashed the check, and crowding his thanks to Mr. Thurston into a wringing handshake and an expressive look, he darted out of the bank for the station.

There was an express freight made up to go down the road to Coleridge and points beyond, and he was fortunate enough to reach the station in time to take this freight. This saved waiting two hours.

He took his seat in the way car more buoyant and hopeful than he had been in a long time. The four hundred and fifty dollars burned in his pocket.

The train was distressingly slow, and he felt a desire to get out and run. He looked around at the few passengers. One of them caught his eye at once.

Where had he seen that man? Somewhere. Ah! He began to recall now. It was at the teachers' convention which he attended two years before.

It flashed over him that the man in the spectacles with the small traveling bag was Professor Frost of the State University. And in the same moment it also flashed over him that he was probably on his way to Coleridge for the meteorite!

The State University was well endowed and doubtless could afford to give a large sum for the specimen. What if the University had sent Professor Frost down to buy at any cost?

Professor Craigstone looked over at Professor Frost, and Professor Frost

glanced at him. Evidently the State University man did not recognize him. They had only met to be introduced, and it was two years before. In that time Craigstone had grown a beard. He was glad he was not known. He would trust to his wits to get the meteor by himself.

He rose and walked over to the other end of the car. A man near the door who had been reading a paper held it out to him.

"See the paper, sir?"

"No, thank you. I don't care to read. But, yes, just let me take it a minute. Thank you."

He glanced over the news rapidly until he came to the following:

"The meteorite that fell at Coleridge has been discovered. It was plowed out of a field on the farm of a Mr. Bent two miles north of the town. The weight of the stone is nearly nine hundred pounds. We understand that he holds the meteorite at four or five hundred dollars. The State University will send down a man today with a view to buying the specimen if he finds it valuable."

"That settles it," thought Craigstone, as he handed the paper back to the man. "But if Farmer Bent is true to his word I stand the first chance, provided I get there before anybody else."

The train rolled into Coleridge at last, and the professor jumped off. With a stride that would have done credit to a giraffe on the run, he measured off the strip of platform, and started through the station to make a short

cut to the farm. He remembered that the road by which the farmer had brought him back started directly from the rear of the station.

There was no time to be lost. He noticed as he came out on the platform that a horse and two-wheeled cart were there, as if waiting for some one. He hurried across the street, and struck at once into a sharp walk up the road leading to the Bent farm.

Being a very rapid walker and having no baggage, he got over the ground rapidly. He had walked an eighth of a mile when he heard the noise of wheels behind him. He looked around, and there was the horse and two-wheeled cart he had seen back of the station. In the cart were Professor Frost and another man, who was driving.

They came up at a good pace, and passed the professor. The State University man looked sharply at Craigstone as the cart whirled by.

The road to the Bent farm was what is known as a "section road;" that is, it was a right-angled road. Each side forming the angle was a mile in length. The country was all fenced, so that to reach the farm it was necessary to drive one mile west and one mile north.

The professor knew that the hypotenuse of a right-angled triangle is shorter than the sum of its other sides. There was only one thing for him to do. He must run for it over the third side of the triangle, and beat the State University man if possible.

In his college days, when in training, the professor had been a noted runner. He still had a splendid physique in spite of his night work and close study since he came out of the university. In the present instance his professional pride, his love for his wife, and another reason which he kept to himself, urged him to get to that farm before the men in the cart could go on the regular road.

He flung himself over the fence, which was a barbed wire, by placing his hands on a post and clearing the wire from the ground. It was a trick of athletics which stood him in good stead now, as nearly all the fences in the country were of the same kind, and almost impassable.

It was a terrible run. The fields were partly plowed, and partly stubble from the wheat harvest, and partly corn as high as his head. Fortunately, only one piece of corn intervened, and he blessed his stars, or his star, as he began to call the meteorite, that the corn was planted in rows that ran nearly in the direction he was going.

So he rushed down the opening between the stalks, unable to see the cart, which was making good time on the first mile. As he came out of the corn field he caught sight of the men in the cart just turning the angle for the second mile.

He had run the entire distance so far, and had covered two-thirds of the distance to the farm. He could see the house very plainly now.

He ran down a sloping pasture, breathing heavily, but getting his second wind, and almost confident of beating the cart. But on reaching the bottom of the pasture he was dismayed to find a slough or gully fully twenty feet wide, and filled with water!

He cast his eye anxiously around for a narrow place. As far as he could

(Continued on Opposite Page)

SLIM & SPUD

A Bone for Every Occasion

see, the stream was wide, and how deep he could only guess. There was nothing for it but to swim it.

The four hundred and fifty dollars had been given him in large bills—four hundreds and a fifty. Wrapping them in a bit of paper, he rolled them up, put them into his mouth, and plunged into the muddy water.

Anyone who has tried to swim with his clothes on, and especially with boots on, will understand what a swim of even twenty feet means. The first plunge took the professor over his head. But he struck out pluckily, and much exhausted, pulled himself out on the opposite muddy bank.

Without waiting except for one brief instant to take the money out of his mouth and clench it in his hand, he started on.

The farm house was near now. The horse and cart were not in sight, but hidden by the slope up which he was now running.

As he panted into the farmyard, he saw the farmer and several other men about the meteorite, which was still in the same spot.

The professor went right up to the meteorite, and sat down upon it. As he did so Professor Frost and the other man drove into the barnyard.

"Mr. Bent," gasped Craigstone, as he hastily unrolled his bills, "here are four hundred and fifty dollars. Count it. You said this meteorite was mine on payment of that amount if no one else got ahead of me. Is the meteorite mine?"

"Yes, sir. It's yours," said Farmer Bent, in astonishment. "No one else has made me an offer. But what on earth have you—"

At this moment Professor Frost came up.

"How do!" said Frost. "What'll you take for that meteorite that fell here two or three days ago?"

"Ask this gentleman," said Farmer Bent, with a shrewd grin in which a good deal of disappointment was expressed. "He's bought it. 'Taint mine no more."

"Professor Frost, I presume," said Craigstone, rising and bowing as gracefully as if he had his wedding suit on, instead of being plastered with mud and looking very much like a "specimen" himself. "My name is Craigstone of Wrayburn. Had the pleasure of meeting you at the convention two years ago. Possibly you don't remember me."

Professor Frost burst into a laugh. "You have beaten me, professor, and I acknowledge it. But I want that meteorite and I am bound to have it. I'll give you five hundred dollars for it."

"Aren't you authorized to give more than that? The State University isn't exactly short of funds, is it?"

Professor Frost looked at Craigstone and laughed.

"Well, young man," he said, "science loves an enthusiast. You have the advantage of me in this transaction. I am twice your age, but I would give one thousand dollars to have your pluck. What will you take for half the meteorite?"

"I don't know. I want to think about it. Mr. Bent, can you lend me a suit of clothes?"

The professor was soon decked out in a dry though somewhat baggy suit, and before dark, he, in company with Professor Frost and the precious meteorite, was on the train bound for home. The University professor parted from Craigstone with many expressions of regret and congratulations.

"You will hear from us yet," he said. "That specimen is too good to be in Wrayburn College."

"But it is my specimen," said Craigstone. "All your bids for it must come to me."

For the next week the professor kept up a lively correspondence with the State University. They made him one offer after another, and he refused. An

Eastern college sent out a man to look at the wonderful stone. He made Craigstone an offer for half of it that almost took his breath away—two thousand dollars for five hundred pounds!

The offer was accepted, and the meteorite was cut in two. The State University heard of it, and the next day came a telegram, "Will give fifteen hundred dollars for remainder of meteorite."

About this time the trustees of Wrayburn College began to wake up. They visited the professor in a body. They even tried to make out that the meteorite belonged to the college. At this, the professor's wife, who was in the room, rose to the defence.

"After all of the money Alphaeus has spent for you out of his own little salary! You know you haven't a shadow of a claim on the specimen. If I was Alphaeus I'd sell every pound of it, and not leave you a bit."

But Craigstone was generous in the matter. He made terms with the State University by which three hundred pounds of the meteorite passed into their hands for twelve hundred dollars. The rest he gave to the college on the condition that it should not be sold.

"Thirty-two hundred dollars!" exclaimed the professor. "After paying Mr. Thurston his four hundred and fifty dollars and our own debt of the same amount, we shall have twenty-three hundred dollars. Belle, let's ask the college for a vacation, and take that long deferred wedding trip we never had. Will you?"

They went. When they came back the professor's little wife said archly, "If we didn't have a honey moon, we had a honey star."

And the professor forgave her.

— A. A. — The End.

MORE HIGH SCHOOLS MADE FOUNDATION AWARDS

IN THE March 18 issue we published the names of youngsters who were among 534 awarded American Agriculturist Foundation Achievement certificates and \$5 for outstanding work in their schools in vocational agriculture and vocational homemaking.

In addition to those names published, awards were made at the following schools but the names of the winners were not reported to us by the schools:

THE COUNTRY CHURCH

In some great day
The country church
Will find its voice
And it will say:

I stand in the fields
Where the wide earth yields
Her bounties of fruit and of grain,
Where the furrows turn
Till the plowshares burn
As they come round and round again;
Where the workers pray
With their tools all day
In sunshine and shadow and rain.

And I bid them tell
Of the crops they sell
And speak of the work they have done;
I speed ev'ry man
In his hope and plan
And follow his day with the sun;
And grasses and trees
The birds and the bees,
I know and feel ev'ry one.

And out of it all
As the seasons fall
I build my great temple alway;
I point to the skies,
But my footstone lies
In commonplace work of the day;
For I preach the worth
Of the native earth—
To love and to work is to pray.

BETTER FARM HOMES

Five Cornell University specialists—three women and two men—are working together to create better, more convenient homes for farm families. For a laboratory they are going to use two single-story, factory-made houses which were erected on the Cornell campus last fall for use by the College of Home Economics.

The two houses will be used to study kitchen arrangements for families of varying sizes, incomes and habits. All activities relating to food will be studied—its preparation, serving, cleaning up, dishwashing; also, there'll be studies on ventilation, lighting, and garbage disposal. Another phase of the research will deal with storage space needed for groceries, produce, dishes, and silverware.

The Cornell specialists taking part in the project are: Professor Helen Canon, head of the economics of the household and household management department; Mrs. Mary Heiner, specialist in kitchen storage and cupboards; Miss Grace Moorin, rural architect; Professor O. C. French, head of the agricultural engineering department, and Professor Glenn H. Beyer of the housing and design department.

Much of the study will be based on a recent survey of rural housing, undertaken cooperatively by the Federal Bureau of Human Nutrition and Home Economics and Northeast agricultural experiment stations. Prof. Beyer compiled the survey and it has been published in book form by the Cornell University Press.

FORTY-YEAR-OLD PONY

pasture early and now he is as slick as a mink. His name is Punch. When he was young, he and his mate Judy used to carry mail out of Sugargrove, Pa. They also plowed gardens and did light work around town.

The young man riding is our grandson, Michael B. McNeill. When he was younger, Punch led our Memorial Day parade for ten successive years.—Frank E. Thayer, Frewsburg, N. Y.

In your June 4 issue on page 6, Mrs. L. L. Johnson tells of a horse her father has that is 34 years old.

We are enclosing a picture of a Welch pony that weighs around 700 pounds and which is 40 years old. He was given to us twenty years ago and was 20 years old at that time. Our four children have all ridden and driven him and now our grandchildren are having fun with him.

Last winter was the first time that we noticed he didn't eat his hay as well as he used to do. We turned him out to good

Kernels, Screenings and Chaff

By H. E. BABCOCK

The present operators of Sunnygables are Jack and Jean Conner. Jack has been familiar with Sunnygables ever since he was in grade school. The war took him far afield. He accompanied a boat-load of mules to India. After the war he tried out ranching in Arizona. Although a town girl, Jean is a graduate of the New York State College of Agriculture where she got very high marks in Farm Management. For a while she worked for G.L.F. But now Jean and Jack have no other business interest in life but the operation of Sunnygables. Their account of their poultry operation may interest you.

BUILT-IN POULTRY

By JEAN and JACK CONNER

THE POULTRY operation at Sunnygables might well be described as "built in." It occupies the second and third floors of the barn, the basement of which is used to loose-house dairy cattle. Due to Mr. Babcock's ill health, little poultry and stock had been run in the barn for a couple of years prior to 1948 when I took over the operation here and decided to fill the houses with laying birds.

The outlook for poultry that year was favorable, and it was a good time to start. My only experience with poultry had been on an Arizona ranch the year previous where we had had a flock of about a hundred hens. But with the high prices of 1948 and some beginner's luck in managing the flock, I came through on the black side with some good experience to boot.

Since then, the outlook has changed to a less favorable one (according to the experts). But, we are keeping our houses full and sticking to the dairy-poultry combination, because in the long run we believe it will pay off. It gives us a good distribution of labor with regular cash returns.

Markets

Since starting out in 1948, we have produced eggs for the local market, the New York City market, and at present for a hatchery in Parsonsburg, Maryland.

We found that the local market netted a good margin above the prices paid for eggs shipped to New York City. The margin was more than enough to pay for the extra labor required in handling retail market eggs. Also, we did not have the extra charges for crating and hauling normally incurred in shipping eggs to New York. Nor were our brown eggs penalized in the local market as they were in New York, where whites bring the higher prices.

In 1949 we started producing hatching eggs and are continuing that prac-

tice this year with about 1400 birds now in the houses. We have a contract calling for a minimum premium of 20c per dozen over the top New York price and a guaranteed market of 44 weeks. Since most hatcheries in New York State buy outside eggs for only two or three months of the year, the 44-week clause is quite an advantage.

Because of the weight-for-age and feathering requirements, we use New Hampshire Reds in this operation. They are good producers of both meat and eggs. However, they do show a strong tendency toward broodiness, especially in warmer weather.

Since these birds tend to put on fat when fed normal amounts of scratch grains, we are attempting to hold down weight by feeding whole oats free choice, and limiting scratch grains to five pounds per hundred birds. This feeding practice has been used successfully in New Hampshire for a number of years, and so far, it is working very well for us. If we find the birds are tending to lose weight on this ration, we will increase their scratch grain.

Quality Pays Off

In all the markets we tried, quality was the payoff. The extra labor and equipment needed to produce quality eggs has been more than offset by the better prices received.

When producing eggs for the local market, one of my customers—a local grocer—raised his egg sales from 60 dozen a week to 150 dozen. By my watching quality at the farm, he was

able to handle these eggs with less loss due to cracks and poor quality eggs, thus enabling him to reduce his handling charges and undersell competing stores. It increased my market and benefited the grocer and the consumer, as well as myself.

One Man and 5,000 Hens?

At a recent meeting I attended of poultrymen from our area, a college professor startled his audience by stating that one man should be able to care for 5,000 hens. Poultrymen in the audience did not agree with this statement, but with the increasing mechanization and development of poultry equipment, the professor may not be too far wrong a few years from now.

In our limited experience with poultry, we have found one of our biggest strides toward making poultry pay has been in saving time and labor. Some of the newer equipment we are now using seems to be very worthwhile from this standpoint.

Colony-Type Nests—In one house we have a colony type metal nest with a slanted wire floor, which allows the eggs to roll away from the hen as soon as they are laid to a catching tray in the front of the nest. The eggs from this nest are easy to gather (as shown in the picture) and require little or no cleaning. However, we did find that these nests were not too successful if the birds had already become accustomed to another type nest. They worked very well when used with pullets right from the start.

We favor the community type nest over the single hen nest. Some community type wooden nests installed when the barn was built in 1933 have proved much more satisfactory and have been much more durable than the single nest metal sections we have purchased.

Soil Heating Cable—An investment in soil heating cable to protect our pipes from freezing saved many temper-try-

ing hours of pipe thawing during the recent cold snap. This electrically heated wire wrapped about the water pipes throughout the barn is controlled by a thermostat switch which turns off and on automatically.

Hydraulic Lift—Our poultry is in a multiple story barn and the problem of getting feed to upper stories conveniently and quickly was a major problem until we put our tractor power fork to work. Since the barn is built into a side hill, the feed for the second story can be delivered direct, but feed for the third story houses is elevated on the power fork of the tractor. With a flip of a lever, five hundred pounds of feed are hoisted to the third floor. Without this mechanical helper, each bag of feed would have to be carried from the truck up a flight of stairs to the third floor bins. That is the kind of labor that makes a man tired at the end of a day.

In addition to these labor-saving devices, it has been our experience that such simple things as the arrangement of feed hoppers to save a few steps each day constitutes a major saving over the period of a year. An hour spent in replenishing nest material will save many hours of egg cleaning, besides the saving in broken eggs.

Replacement Stock

Based on experiences to date, I am not planning to raise my own replacements. The lack of proper facilities is the main reason. Baby chicks seem to be quite susceptible to a multitude of diseases. The common recommendation to avoid most of them seems to be isolation from the older birds. If I were to raise my own replacements, the older birds would have to be sold off or new buildings constructed.

In 1949, when I could not purchase birds to start my original flock of breeders, I sold my old birds. It meant several months of high feed bills and no cash income, besides the investment of capital in brooders, feeders, waterers, and other equipment which is used only a relatively short time each year.

At present, birds of the strain I want for breeding are available as started pullets. Other poultrymen change their plans or buy more than they can handle. These birds can be bought at a lower cost than I can raise them when all the extra labor and equipment, as well as death losses are considered.

Poultry Future

The life cycle of a hen is rather short and poultry plans are usually made in a very general way and the details filled in each year. As we look ahead, we are convinced that our best bet is to produce eggs the year around for either a hatchery or the retail market. These markets pay a premium for quality. The flock will probably number between 1200-1500 producing birds. Poultry must work with dairy in our set-up and not against it.

↑ Gathering eggs from a "direct delivery" nest. The floor of the nest is slanted so that the egg rolls away from the hen as soon as it is laid. Hens cannot walk on the eggs and broken, dirty eggs are at a minimum.

➤ Nest opened to show slanted wire floor and curtain dividers.

American Agriculturist Subscriber Recognizes Pettit's Picture---Arrest Follows

By H. L. Cosline

WHEN WE published the picture of Lincoln Pettit and the girl he abducted on our March 4 Service Bureau page, we hoped it would get quick results. It did! The first person to recognize the pictures of the two and to take action was our subscriber, Mrs. Adrian Blankenburg of Williamson, Wayne Co., N. Y.

The date was Saturday, March 4, the date of the issue containing the pictures. In her issue on the Service Bureau page Mrs. Blankenburg recognized the couple, having several times seen them peddling fruit and vegetables in her neighborhood. She immediately called the Newark, New York,

This picture of Lincoln Pettit which appeared in the March 4 American Agriculturist led to prompt recognition by a subscriber and to his arrest by New York State Troopers.

station of the State Police and told them her suspicions. The descriptions of the two people were radioed to the Alton State Police Barracks. Two troopers located them in a nearby cabin and Pettit was arrested.

On questioning, Pettit admitted that he knew he had been recognized several times but that he was always able to leave the area before he could be arrested.

The incident leading to Pettit's arrest is one which aroused the indignation and sympathy of many people inasmuch as he had abandoned his wife and children, taking with him a 13-year-old girl. Pettit waived extradition and he and his companion were taken back to Connecticut by Trooper George Bunnell and State Policewoman Theresa Petrina.

Almost immediately after the arrest a letter of appreciation was received from Edward J. Hickey, Commissioner of State Police of the State of Connecticut which, in part, said:

"Please accept the gratitude of the Connecticut State Police Department and in particular the gratitude of the Kirby family for the cheerful and cooperative efforts and the excellent results obtained through your interest in publishing in *American Agriculturist* the 'wanted' notice for the fugitive Pettit."

Naturally, every member of the *American Agriculturist* staff and family will feel a distinct satisfaction in the service which was rendered. The incident is convincing evidence of the wide distribution of *American Agriculturist* and the thoroughness with which it is read by members of the A.A. family.

I BOUGHT A "HAY PRESERVATIVE"

LAST SPRING I received literature from a local feed dealer advertising a mixture which, the manufacturers claimed, would prevent heating and spoilage of farm products such as hay, grain, or silage while in storage.

I was interested in the part which stated that hay of high moisture content could be safely stored without excess heating or spoilage if a small amount of this powder were mixed with it.

I purchased 100 pounds of the material at a cost of \$15.00. From the

printed information on the bag I learned that it was guaranteed to give satisfactory results or the purchase price would be refunded. I also discovered that it was composed of sodium bicarbonate and calcium carbonate.

This is what started my skepticism of the value of the product. Apparently it was soda and a "salt." It was a very busy time of year, so I did nothing to investigate it until this winter.

I looked up methods of curing hay in the 1948 Yearbook of Agriculture. It has this to offer: "Experiments in this country do not indicate that the addition of salt or other chemical substance, supposed to aid in keeping hay from heating in the mow, will prevent hay from heating or increase or preserve its feeding value."

I have a complete report from the Agronomy Department at Cornell of the tests made with preservatives whose principal active ingredient was sodium bicarbonate.

A laboratory test showed that samples of hay, treated or untreated, reached essentially the same maximum rate of respiration, indicating equal molding. The samples heated to a maximum of 15° F. above air temperature. Thus this method of testing gave negative results.

The report concluded that preparations containing sodium bicarbonate, drying agents, or mixtures of the two, offer no promise as a practical solution of the problems involved in the storage of undercured hay. I have a similar report from General Research, Inc., Chicago, Ill.—T. M., N. Y.

— A.A. —

WATCH OUT

Many New York subscribers have reported unsatisfactory dealings with itinerant truckers. For the protection of farmers selling produce to such truckers who are not operating from an "established place of business," the New York State Department of Agriculture and Markets requires that they shall be registered with the Department. A list (arranged alphabetically by counties) of registered truckers is available on request to the Department of Agriculture and Markets, Albany, N. Y.

Each merchant truckman who is registered is provided with a permanent metal sign which must be clearly displayed. It contains the name and address of the registrant and the expiration date of his registration. In addition, each truckman is given a personal identification certificate giving his name, address, description and photograph. This certificate must be shown on request.

We feel that *American Agriculturist* subscribers will be wise to deal with registered merchant truckmen in New York State. Also, it is important to keep records of transactions, deposit immediately checks received in payment, and report promptly to the Commissioner of Agriculture and Markets, Albany, N. Y., any complaints or delay in settlement for farm products sold to merchant truckmen.

— A.A. —

WHERE CHARITY BEGINS

I have been solicited for money by the Girls Vacation Fund of New York City. Is this reliable?

So far as we can learn, this organization is doing a good job. However, it appears to us that New York City residents should be glad to take care of their own boys and girls. Certainly there are plenty of opportunities for upstate farmers to contribute to worthy projects which are aimed to help upstate young people.

Clean Sweep and a Faster Job

The New Idea Mower is completely power operated, hitched in a jiffy to any modern tractor; unmatched for smooth cutting and easy handling. Stronger, sturdier, always reliable.

that's why a **NEW IDEA** is a good idea!

Brand New! NEW IDEA No. 175 Elevator

Extra sturdiness for your heaviest handling jobs. Safely and speedily handles bales, bags, boxes, crates, ear corn, small grains, etc. Body and closed return trough built of weather-resistant galvanized iron. Performs efficiently at speeds of 100 to 140 R.P.M. on inclines up to 40 degrees. Available in lengths from 26 to over 50 feet—and for operation with gas engine, electric motor or power take-off. Many other special features.

Whatever your field conditions — hilly, level, rocky, gullied — the NEW IDEA Side Rake takes them all in steady stride. Rigid steel-girder frame holds it permanently in line at any tractor speed. Flexible 4-bar spiral reel yields quickly to any obstruction. Here's the solid strength of NEW IDEA quality construction. Here's the added advantage of a dependable tedder — always ready when needed. Here's smoother, faster raking season after season.

And positive pick-up too! NEW IDEA double-curved teeth make a clean sweep of every crop. They're tough, resilient, quickly and easily detachable. No other tooth design can match their gentle, thorough windrowing and tedding. No other rake can give you this plus-performance feature!

There are many more facts about NEW IDEA Haying Machines that mean money to you—how they can safeguard feeding value, save you hours of hard labor, boost your profits. Get them first-hand from your friendly NEW IDEA dealer. Mail coupon for free literature.

AMAZING GROWTH

FROM THIS

TO THIS
IN ONLY 5 WEEKS

Proved by 101 Million Chicks on PURINA STARTENA CHECKER-ETTS

This is an actual photograph showing the amazing leg growth in less than 5 weeks on PURINA STARTENA CHECKER-ETTS.

Is it any wonder that folks by the tens of thousands switched to Checker-Etts last year? We've received reports from all over U. S. and Canada... and here's what they say:

- ... "Fastest growth ever."
- ... "Unusually high livability."
- ... "Chicks take to them quicker than mash."
- ... "Less waste from feeders."

Aren't these the things *you* want from the chick starter you buy? Then why not do as folks who raised 101 million chicks did last year? Go to your Purina Dealer and say, "I'll take STARTENA CHECKER-ETTS—just 2 pounds for each chick I'm starting."

**RALSTON PURINA
COMPANY**
Buffalo, N. Y. • St. Johnsbury, Vt.
Wilmington, Del.

"In 26 years in breeding and hatchery business Purina Checker-Etts are right at the top of starters I have used."

—Q. A. SCHILMEYER,
ORANGE, CALIF.

"The chicks I started on Checker-Etts were uniform in size, feathered early, and wasted little feed."

—MILTON VOIGHT,
MARYVILLE, WIS.

"The good start my chicks got on Checker-Etts helped them come into production lots earlier than usual."

—WALTER WOOTEN,
TAMPA, FLA.

"I've never seen chicks grow faster or feather better than those I started on Checker-Etts."

—VINCENT BUFARLE,
PERKASIE, PA.

He Never Got the Barn Built

Each year at the end of March, when the first buds of spring appear with the warm sun, and balmy air brings a touch of spring fever, my follow-up file regularly produces a story by Roy O. Eastman to keep me toeing the line:

"Old Sam Hubbard died the other day. Some allowed it was inflammatory rheumatism, but my opinion is that it was just old age and disappointment.

"Judge Hicks came around the day of the funeral, and as the folks were carrying out the coffin, he looked about at the tumble-down corncrib, the rusty pump handle, the apple tree with one dead limb that was blown down time of the big storm five years ago, and all the rest of the surroundings; and then he spat at a bumblebee, squinted at the sun and said:

"So Old Sam never got the barn built."

"And that in a sentence was the story of Sam Hubbard's life.

"It was twenty years ago that he settled on the Hull place, a fairly young man, and pretty spry.

"Likely place you got here," a neighbor said. "You ought to do right well on it."

"Sam drawled in reply, 'Likely enough. But it sure does need a new barn bad. That's the first thing I got to do—build me a new barn.'

"But a year went by and no signs of starting the barn, though we all knew Sam had the money in the bank.

"You have some nice trees in the orchard," the county agent remarked one day. "But you're going to lose them unless you do some pruning and cultivating."

"That's right, that's right," Sam agreed. "Got to get at them the first thing after I get the barn built."

"Why don't you plow up that north forty?" another asked. "Get a good stand of corn there."

"Yes, ought to do that. But I've got no room for the fodder as things stand now. First I got to get the barn built."

"Your tools are rusting bad out there behind the cowshed," said another.

"Now that's a pity," Sam would reply. "No other place to put 'em. Clean 'em up good and put 'em away just as soon as I get the barn built."

"Two years, three years, finally ten years rolled by. Place got seedier and seedier. Kids grown up and out of school. Oldest boy suggested that the old man—that's what they called him now—sell out and move to town. 'Nope,' Sam demurred. 'This place has got the makings of a darn good farm. Just wait till I get the barn built, and you'll see.'

"Finally Sam just up and died. And except that the place was twenty years older and twenty years more tumble-down and rickety, and twenty years sadder, it was just the same as the day he moved in. As Judge Hicks said, 'HE NEVER GOT THE BARN BUILT!'"

♦ ♦ ♦ ♦

I have a definite schedule for my "farm." What's yours?

(Date) _____ Barn built

(Date) _____ Orchard pruned

(Date) _____ Plowed the north forty

AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

GREEN GRASS to Red Meat

AS ONE of twenty guests of Armour's Livestock Bureau, I have just returned from a two-weeks, 7,000 mile trip through eight western states to take a look at our great livestock industry. We travelled by air, leaving a major part of each day for visiting ranges and ranches.

The livestock business, from raising animals to selling meat at retail, is intensely competitive. Fred Hatch, president of a group of livestock salesmen in the Chicago stockyards, told us how sellers watch buyers very carefully to observe any peculiarities which might give away their thoughts. "For example," he said, "there is one buyer who always hitches up his pants when he is very anxious to buy. When we see him do that we are always a little slow to sell and want a little more money."

The Chicago stockyards are not owned by the packers. They are owned by a separate corporation which charges a definite fee per animal per day for the service it provides. The animals shipped from farms are put in pens and sold by "good old Yankee dickering."

Livestock men ship to market when they think the animals will bring the most money. Packers buy all that come. If the supply is short, the seller wants more money; if the

supply is large, he will take a little less. Supply and demand still operate in livestock selling.

When livestock is processed into meat nothing usable is wasted and among the latest by-products are many useful in the treatment of diseases. But before these medicinal products can be made, tremendous sums must be spent in research to develop new products, and particularly to develop better and cheaper methods of preparation.

If you agree, as those of us on the trip did, that the packer cannot be blamed for high meat prices, we must also agree that the fault

By H. L. COSLINE

does not lie with producers. Over the years the increases in efficiency of meat production have been tremendous. Better animals use feed more efficiently. Where once cattle were kept on ranches from four to six years, some are now marketed before they are a year old. Every possible labor-saving device is used. Losses of stock are kept at a minimum by providing water and by controlling coyotes and other wild animals, as well as external and internal parasites.

In most of the West, water is the big problem. Peter Mocho of San Mateo, New Mexico, told me his state has everything but water and practically no problems, not even noxious weeds. But if they had plenty of

Each steer is run through a chute where an electric prod encourages the progress of stubborn animals. The man at the right catches each animal in a stanchion with a lever as it starts to jump through the opening. The man at the left is ramming a worm capsule down a reluctant steer.

water the weeds would doubtless develop!

In general we found that there is more rain or snow at higher elevations and more as you travel from West to East. For example, at Tucson, Arizona, where the elevation is about 4,000 feet and the annual rainfall is about ten inches, you will find little but cacti. Thirty miles away where the elevation is 6,000 feet and the rainfall around twelve to fourteen inches, there is some cacti, but there is also considerable grass.

Like many other western areas, the Imperial Valley in Southern California is a barren desert except where irrigated. The annual rainfall is variously reported as from two to two and one-half inches a year. One man there is reported as saying, "I saw it rain once, but my six-year-old son doesn't know what rain looks like." While the principal crops there are vegetables. (Continued on Page 17)

A small corner of the Sinton and Brown feed lot where an average of 100 steers are sent to market every day. In the background there is a beet sugar factory. The beet pulp is delivered by an overhead pipe into pit silos that hold 100,000 tons.

Left to right: Tony Valdez, sheep herder; L. M. Skelington of the Gannett Newspapers; and Jack Kippen who owns sheep. Tony and his helper live in the wagon for months at a time. The nearest settlement is 10 miles distant.

"No Better Corn At Any Price"

There's a G.L.F. Hybrid to Fit Your Farm

HYBRID seed corn need not be high priced in order to be good. There is no great mystery about hybrid corn which is not general knowledge to plant breeders and seed producers. G.L.F. hybrids have been developed by some of the outstanding plant breeders in the United States. They have been consistently rated high in agricultural college tests for yield, standability and husking qualities.

More and more farmers each year turn to G.L.F. for hybrid corn that will grow and produce under Northeastern soil and climatic conditions. Because they fit G.L.F.'s overall distribution program so well, it is possible to make these high quality hybrids available at reasonable prices.

A G.L.F. Hybrid to Fit Your Farm

The G.L.F. line of hybrids ranges from very early through to late varieties so that there is a G.L.F. hybrid to suit practically every local growing season in G.L.F. territory.

G.L.F. Hybrids develop strong root systems and sturdy stalks which prevent lodging and

make harvesting easier. Thorough drying and chemical treatment of all G.L.F. seed corn before shipment controls the growth of molds and seedling diseases.

Open Formula

G.L.F. hybrids are the same each year and the open formula assures farmers of consistency in

How to Select the Right Hybrid

The Hybrid Corn Chart displayed at your local G.L.F. Service Agency shows the full line of G.L.F. hybrid corn in actual color. The growing season for each hybrid is listed along with what each variety is best suited for—grain or ensilage. To determine the right hybrid, you should consider the length of the growing season and the elevation of your farm. Your growing season can be determined by the frost dates in your area. A corn that takes advantage of the full growing season is the one best suited to your farm and will usually produce the greatest yield.

type which lets them know what they are buying. The plump, well-matured kernels have high germination power, and grow stronger even under cold, spring soil conditions.

Fertilize Well

NEW YORK—150 to 400 pounds of 10-10-10 or 250 to 700 pounds of 6-12-6 depending on amount of manure and whether or not manure was superphosphated.

NEW JERSEY—Not manured: 500 to 800 pounds of 5-10-5 plus 150 pounds of ammonium nitrate or 300 pounds of nitrate of soda at last cultivation. Manured: 300 to 500 pounds of 4-12-4.

PENNSYLVANIA—200 to 500 pounds of 5-10-10, 4-12-8, or 6-12-6. Note: All states, to avoid seed injury, do not apply over 300 pounds with corn planter, unless planter places fertilizer at least two inches from the seed; broadcast remainder.

Terrace Hill, Ithaca, N. Y.

G.L.F. Hybrids for Crib and Silo

The Farm and Home Center in Genesee County, N. Y.

By JEANNE PONTIUS RINDGE

THE GENESEE County Farm and Home Center—one of the country's finest—is a unique demonstration of co-operation between farmer and city citizen. An outgrowth of it, the Farmer's Round-up, has become a highly successful annual affair for money-raising, instruction, and plain good fun.

What these Western New Yorkers are doing can be done with equal success elsewhere.

The Center idea was spearheaded by a group of Farm Bureau, Home Bureau, and 4-H Club Association members who wanted an adequate building to house all agricultural groups and offer meeting space for farm and civic affairs. Within 15 months, they had taken option on the dilapidated, once-handsome Lay Mansion on Batavia's main street, raised money for its purchase and remodeling, and pushed the project through to completion in spite of post-war costs and shortages. The building has been in use for more than a year.

To raise the \$8,500 purchase price of the historic house, 75 farmers contributed more than \$6,000—enough to permit borrowing the full cost when the option deadline was reached.

Remodelling the great structure became a \$60,000 task. Volunteer labor, used wherever possible, saved thousands more. In the spirit of early frontier "house raisings", farmers trekked in after a hard day to pull down plaster, knock out walls, reset partitions, insulate the roof and cover the bare floor with plywood as a base for linoleum tile. Two hundred farmers worked all one winter—seven or eight from one area joining up on one project.

Everybody Helped

Home Bureau units, in the meantime, were holding card parties, rummage, linen and bake sales, dances, suppers and other money-raising events. 4-H'ers gave a series of one act plays. Farmers sat down with farmers and came away with contributions.

Batavia, happy at the prospect of restored beauty for the old mansion—

and proud of its largest "industry"—backed the campaign. Business and industry gave. The women pushed a "proud pennies" project ("give a penny for each year you have lived in Batavia") which netted enough to restore the outside of the building.

The two Farmer's Round-ups, held in August of '48 and '49, were the largest single money raising events. With no paid concessions, they featured agricultural exhibits; hedgerow removal, potato digging, beef grading and airplane dusting demonstrations, speeches, dancing, and great stacks of food including a well-filled barbecue pit. Labor, once again, was strictly volunteer.

The auction of donated livestock and produce at the second Round-up brought in \$4,500. Five thousand attending contributed \$2,500 net at the first Round-up. Twenty thousand swarmed into the second, grossing over \$11,000. Plans for '50 are on the fire.

Thirty months after the idea was born, only \$14,000 remains to be raised—and the Center teems with activity. Farm Bureau, Home Bureau, 4-H Club and Soil Conservation offices (with adequate mimeographing and filing rooms), the Production Credit Ass'n., Federal Land Bank, and The Genesee County Cancer Society, all are housed there. Agricultural Conservation will move in soon.

A unique feature is the large demonstration kitchen which stands on a raised platform at the end of the auditorium. 150 people can observe instruction in food preparation. Local Home Bureau instructors are trained here. The auditorium is used for meetings of all kinds.

Behind the building is that boon to the farmer—a spacious parking lot. No detail, you see, has been overlooked.

—A.A.—

The "Call of the Land", a new book by Harold Sherman, is a novel which tells how the formation of a 4-H Club brought life to a backward community. The price is \$2.00 and it is published by M. A. Donohue & Company, 711 South Dearborn Street, Chicago, Ill.

Through joint efforts of city and farm folks, the former Lay Mansion, built in Batavia, N. Y. in 1820, has been converted into this modern Farm and Home Center above. The modern demonstration kitchen, at one end of the auditorium, is shown at left.

For rugged farm work and bigger crop profits

SPRING IS A BUSY TIME ON THE FARM . . . plowing, harrowing, planting . . . lots of heavy work for your farm machinery. TAKE CARE of that important machinery and equipment with dependable ESSO lubricants and fuels . . . keep your tractor, truck, and family car in tip-top operating condition during the busy spring work season. ESSO FARM PRODUCTS are specifically made to meet the most rugged farming requirements.

Esso Extra Motor Oil — for Extra engine protection . . . Extra oil economy in your car, truck or tractor.

Esso Extra Gasoline — gives tremendous power, long mileage and high anti-knock performance under load!

Essolube HD Motor Oil — just right for heavy-duty diesel or gasoline tractor and truck engines. Dependable all-weather service for rough going.

Esso Tractor Fuel — for "distillate" burning tractors. High power, smooth efficient operation . . . low flash-point for faster starting.

SEE YOUR ESSO FARM DISTRIBUTOR FOR THE COMPLETE LINE OF ESSO FARM PRODUCTS

Constant Esso Research aids the farmer

At one of America's largest and most modern petroleum research centers (above), we are constantly seeking ways to make farming easier, better, more profitable. New products and methods are being tested in co-operation with state farm experiment stations to meet farming problems.

A RESPONSIBILITY

THE first Tuesday in May is the date of the annual school meeting in the common school districts of New York State. Some school meetings, like those in some central and union districts, are held later in the summer.

The point that needs emphasis here is that the school meeting is the most democratic institution we have left, and it is the least used. Unless there is a row on, few voters have enough interest to come out to the school meeting and take an active part in the proceedings.

The school meeting has the power to elect the trustees or members of boards of education, and these boards of trustees can hire the teachers. State authorities have nothing to do with this important function except to see that the teachers are properly qualified.

The school meeting determines the budget for the district and arranges for financing the school. If new buildings are needed or old ones need to be remodeled, voters at the school meeting must approve.

If it is necessary to contract with other districts for education of the children, the meeting must approve the contracts or do it through its trustees or board. In other words, the local school meetings have almost complete jurisdiction over their own affairs.

Very little can be said for criticisms of schools, teachers, trustees or members of boards of education by any citizen who has not been in a school-room since he left school, who has taken no part in organizations like the Parent-Teacher Association, and who has not been enough interested to attend and take part in the school meeting.

On the other hand, school meetings should be well enough organized and made interesting enough to be worth attending. They should be well advertised in advance, the business should be well presented and explained, there should be plenty of time for discussion, and music or some entertainment could well be provided, including refreshments and possibly a good speaker.

School populations in the elementary and high schools are increasing by leaps and bounds. Our national population has increased three times in the past 75 years, but high school enrollments alone in the United States have grown 90 times since 1900. And the number of high school graduates has soared from 1 million to 30 million. Half of this increase has come in the last 15 years. The 25 million students now comprising our American public school population will be increased in the next decade by some 30%, another 7 or 8 million students.

These facts place a tremendous responsibility upon all of us interested in education, and particularly upon the fathers and mothers and the voters in the local communities.

WE NEED MORE LIKE THEM

"This country is composed of two kinds of people: one group believes that the government can support all the citizens; the other wonders whether all the citizens can support the government.

"If we take the cost of government for 1950, and then figure the same rate of increase for the next 50 years, our government would cost six trillion dollars, or six times as much as the whole national income. On that basis, we would also have working for the Federal government alone 20 million men and women. The lesson of these simple figures is that unless we find some way of reducing the cost of government it will soon grow so great as to consume not only everything that we all earn but everything that we have all saved, and ultimately everything we call property, which is owned by all of us."—James A. Farley, Postmaster General under Franklin Roosevelt and formerly Chairman of the Democratic National Committee.

THE average "hidden" tax bill of 45 million taxpayers receiving \$5,000 or less per year is over \$500. In 1948 the Federal Budget was $\frac{1}{3}$ greater than the total returns from the 6 million American farms.

Senator Paul H. Douglas, a Democrat from Illinois, recently told Congress and his constituents that he would not support their favorite canal

By E. R. Eastman

project in the south Chicago area and another 100 million dollar navigation project in the western part of the state, and he has been outspoken in trying to get 3 billion dollars cut from President Truman's 1951 Budget.

Hats off to men like Farley, Douglas and Senator Harry Byrd from Virginia, who brave the spenders in their own party and their own constituents to try to put a stop to the ruinous spendthrift policies of the politicians in both the states and the nation!

THE BASIC SEVEN

ASSOCIATE Editor Cosline comes back from a quick airplane trip across America to report that the emphasis placed by Ed Babcock and *American Agriculturist* on the great value of the animal diet has caught the interest of people everywhere in America. The animal diet is another way of emphasizing the need for the "basic seven" foods advocated by dieticians and nutritionists. They are:

1. MILK

A very minimum of a pint a day; a quart is better, and Dr. McCay of Cornell says that even more is necessary for people of middle age or older.

2. EGGS

At least 2 or 3 a week; one a day is better.

3. MEAT, CHEESE AND FISH

At least one serving a day.

4. BUTTER

At least 2 or 3 tablespoons daily.

5. VEGETABLES

Two or more daily, besides potatoes, with a green and yellow vegetable frequently.

6. FRUITS

Two or more a day.

7. BREAD OR CEREAL

Bread should be whole grain or enriched.

The above standard diet may be varied by your physician if you are not well. In general, it is better to eat lightly if you are middle-aged or older, particularly if you are not working at hard physical labor all the time. Every extra pound you add to what should be your normal weight adds another burden to your heart. It's the lean horse for a long race!

LET'S TALK ABOUT and USE MORE DAIRY PRODUCTS

"The superiority of good butter and its continued use on the tables of America is basically unchanged; in fact, the colored oleo will have nothing except convenience to offer above the uncolored product so long on the market. The half cent tax now repealed will obviously not be reflected in retail prices. In fact, we shall be surprised if the price is not raised to whatever the traffic will bear.

"The oleo industry we suspect was quite content to have the battle drag along and kept a live issue in Congress. They were getting editorial support from metropolitan newspapers and national magazines which money could never have bought.

"Let us not waste time in mourning or recrimination, but rather get fully back of our own industry groups in the improvement and merchandising of our own products. Let's talk about how good dairy products are, rather than how poor or dishonest is the product of our competitors."—Editorial, *The Holstein Friesian World*.

TO the above excellent advice should be added that the responsibility rests more heavily than ever on the butter industry to improve its quality. Nothing will drive a customer to oleo more quickly than poor butter.

Also, it is more evident than ever that a dairyman who sells milk and buys oleo for his own family is helping to cut his own throat and has no just complaint whatever about low milk prices.

CRUSHED HAY IS GOOD

AMONG the many new ways of harvesting the hay crop is the use of a new hay-crushing machine. Dr. Kenneth L. Turk, head of the animal husbandry department in the New York State Col-

lege of Agriculture, writing in the *Dairymen's League News*, reports results of tests on the effect of crushing the stems of hay when harvesting upon rate of curing and palatability of the resulting hay.

The process greatly speeds up the curing of the hay and improves its quality because it is unnecessary to leave it so long exposed to the weather.

In the tests, milking cows were given free access to crushed and uncrushed hay cut from the same field at the same time. The cows chose the crushed hay.

The tests were not conducted to show the difference in feeding value of the crushed hay with regular mowed hay, but because the crushed hay was of higher quality, its feeding value was no doubt higher.

The crushing machine used consists of a cutter bar followed by a pick-up arrangement that delivers the hay through steel rollers which crush the stems. It operates on a power take-off with a hydraulic lift. The hay then falls to the ground in a flat, uniform swath.

WORTH TRYING

A SURVEY conducted by the G.L.F. in New York State last August resulted in 172 replies from farmers who have tried birdsfoot clover on their own farms. Of this 172, 81% rated their results to date as fair, good or better; 16% said they had poor results; and 3 were not yet sure. More than 80% of the farmers indicated that they will use more birdsfoot in the future, and 90% were of the opinion that birdsfoot could be used to advantage on other farms in their neighborhood.

These birdsfoot growers represented a total of 527 years experience on 1,731 acres.

Growers were asked to name advantages and disadvantages of birdsfoot. Only one disadvantage was mentioned often. It was "difficult to establish." Good results listed were: "long-lasting," "re-seeds itself," "makes good pasture and roughage" (with many comments on good yields and high feeding value as pasture or as hay or silage), "withstands dry weather," "longer, later harvesting season," "good on hillsides and rough land," "does well on poor soils."

It would seem that this experience is enough to justify at least a trial of birdsfoot.

AN AMERICAN VICE

IT is unfair, even discourteous, to ask a speaker to travel a long distance to take part in your program and then start the meeting so late and put so much business ahead of the main speaker that both he and the audience are completely tired out by the time he comes on the program.

That's one of the chief reasons why it is difficult to get good speakers for meetings. It has always been hard for me to see why a meeting called for 8 o'clock should start at 9 or later. Why is it that it seems to be the habit of most Americans to be late for everything? Those who arrive on time have to wait and waste their own time until the tardy ones get there.

No other one thing could more improve the ordinary conference or meeting, large or small, than to start it on time even if there were only two or three present. The next time, most of the late-comers would be there on time.

EASTMAN'S CHESTNUT

CURRY WEATHERBY comes back from a much deserved vacation in Florida to tell a story that he got from a minister at a church service which he attended. The story could be applied to a good many people.

It seems there was a young preacher who was sent to a mission for a Sunday service. Several Indians attended. Anxious to know how he did, the young minister asked one of the braves:

"How did you like my preaching?"

With a deadpan face the brave replied:

"Big wind! Much thunder! No rain!"

AA's Farmers' Dollar Guide

FARM PRICE TRENDS: In studying probable price trends two impressions have stood out. First, farmers generally have known that favorable war-time relationships between what they sold and what they bought could not continue. Second, in recent months farmers have been more alarmed over the possibility that prices would continue down than they have over the drop in prices up to date.

Several talks to Cornell Farm and Home Week audiences were encouraging. Speakers believe that the price decline may be over, at least temporarily, that we may be in for a year or two of relative price stability, and that efficient farmers who are not heavily overburdened with debt should do all right. They base conclusions on industrial activity which brings good demand for food, and on the fact that prices of what the farmer sells and what he buys now seem to be in reasonable adjustment. Prices of individual products will continue to fluctuate with supply and demand.

Some farmers may be surprised to know that price declines of past two years have hit all groups producing basic raw materials. Farmers are one group, but there are others including producers of minerals, steel and other basic commodities.

GOVERNMENT IN BUSINESS: Few citizens realize the extent to which Federal government is in business. For example, government (taxpayers) manufactures about 10% of the country's electric power. If visions of some planners become realities, the government share will be nearer 50%. It's strange but true that government properties pay no taxes, often build up deficits. Nowhere in world is government operation noted for efficiency.

GOVERNMENT ECONOMY: Probably current talk of government economy will not bring startling budget reduction. It will kill, at least temporarily, many ambitious schemes for government expansion into fields of socialism and government ownership.

Some signs are encouraging. Senator Douglas of Illinois flatly refused to support local "pork barrel" project. He said it wasn't essential that he go back to Congress. Placing the national welfare above personal gain deserves comment and support. Representative Wadsworth of New York has adopted "stubborn" attitude saying he would vote for appropriations only if absolutely essential. To be effective, such attitudes must be supported by taxpayers.

CENSUS: Present U. S. census is expected to show at least 150 million souls. In time, surplus food may be no problem. In meantime some economists question the ability of consumers to buy more meat which is one recommended remedy for crop surpluses. Consumer has the final say as to what his pay check is spent for (for example a better diet or a new car) therefore, more information about the importance of a better diet should increase market for food. The feeling that this education of consumers is primarily the job of farmers rather than government seems to be increasing.

SMALL BUSINESS SOUND: Recent conference of small business organizations at Washington representing 600,000 little concerns gave an emphatic "no" to government proposals to bolster small businesses through government loans. Instead, delegates demanded a cut in Federal spending, a reduction in the national debt, and support of the Taft-Hartley Labor Law!

WORLD TRADE: In many respects America is unique. One is that its citizens want to export more goods to foreign countries but desire restrictions to decrease imports. Many countries in the world think in terms exactly opposite. The more they can import, particularly if they don't have to pay for it, the better their standard of living.

Citizens, including farmers, must understand that in the long run, value of imports must equal exports. Congressmen who rave about American jobs lost by imports ignore American jobs MADE by exports. We agree, however, that it does not make sense to allow large imports of products, U. S. prices of which are maintained above world levels by price supports. For example of what we are talking about, consider potato imports from our neighboring country across the border. Real answer is that potato support prices have been too high. —H.L.C.

The Song of the Lazy Farmer

IF APRIL showers make you blue, I've naught but sympathy for you, because I'm sure that worrying will never change a single thing; and it proves you don't understand that Nature's way is really grand. The very folks who cry with pain at ev'ry little springtime rain, would prob'ly also be the first to moan if ground and plants should thirst; and if spring flowers didn't bloom, they'd plunge the deepest into gloom; they'd holler loudest 'bout the dust and say it absolutely must cloud up and rain to beat the band or we can't even plow our land.

But farming problems are not my main worry 'bout a spring that's dry; there's other things upset me more when rain don't splash or thunder roar. For one thing, I can sleep more sound whenever I hear raindrops pound upon the roof and window pane, 'cause there's no lullaby like rain. And when the day is overcast, there ain't no jobs to be done fast; there's time to spend upon the porch without fear that my wife will scorch me 'cause the field work isn't done; there isn't anything more fun than list'ning to the rain-drops say, "You do not have to work today."

NEW MILD CHEMICALS

Control Diseases Better,
Help Increase Yields of
Fruits and Vegetables

FRUIT AND VEGETABLE growers report greater vigor of growth in their crops when they control diseases with Du Pont fungicides . . . "Fermate" . . . "Parzate" . . . and "Zerlate." And more important, this increased growth results in higher yield and better grade.

This comes from two important characteristics of these new Du Pont organic chemicals: They are effective against many fungous diseases, and they have such extraordinary mild reaction on foliage and fruit that the growth reaches its fullest normal extent. Moreover, these fungicides are compatible with most other spray and dust materials.

ON APPLES, for example, in a six-year test "Fermate" improved the yield of scab-free fruit by 74% and increased the total yield 59%

compared to sulfurs. The test showed that "Fermate" also improved fruit set above that with harsher fungicides, and produced no leaf burn even in hot weather.

In addition to scab, "Fermate" controls rust, black rot, and sooty blotch on apples and pears, brown rot of stone fruits, cherry leaf spot, grape black rot and raspberry anthracnose.

FOR POTATO BLIGHT, both early and late, "Parzate" is outstanding, as shown by farm tests with 7 fungicides in 9

states. Potatoes sprayed with "Parzate" gave the highest yield and produced 236 more bushels per acre than untreated potatoes. Michigan growers report that potatoes sprayed with

★ ★ ★

DU PONT CHEMICALS FOR THE FARM INCLUDE:

Fungicides: PARZATE*, (Liquid and Dry), FERMATE*, ZERLATE*, Copper-A (Fixed Copper), SULFORON* and SULFORON*-X Wettable Sulfurs . . . Insecticides: DEENATE* DDT, MARLATE* Methoxychlor, LEXONE* Benzene Hexachloride, KRENITE* Dinitro Spray, EPN 300 Insecticide, Calcium Arsenate, Lead Arsenate . . . Weed and Brush Killers: AMMATE*, 2,4-D, TCA and 2,4,5-T . . . Also: Du Pont Cotton Dusts, Du Pont Spreader Sticker, PARMONE* Fruit Drop Inhibitor, and many others.

*REG. U. S. PAT. OFF.

On all chemicals always follow directions for application. Where warning or caution statements on use of the product are given, read them carefully.

"Parzate" produced 40 bushels more per acre than with other fungicides.

WITH TOMATOES, "Parzate" controls leaf mold, leaf spots, early and late blight. Grower reports from 1949 show that it

gave better disease control and an earlier ripening crop that was a third larger than with other fungicides. "Parzate" is also excellent to control celery leaf blights, downy mildew of cucurbits, anthracnose of beans, downy mildew of spinach and beets, plus other diseases of vegetables and flowers.

FOR ANTHRACNOSE of tomatoes, "Zerlate" is the outstanding fungicide. Control of early blight and anthracnose with this Du Pont fungicide has increased the return as much as \$250 per acre. It also gives remarkable results against downy mildew, anthracnose and leaf blights of squash. In Massachusetts, for instance, "Zerlate" increased the yield by 32%.

NEW INSECT KILLER HAS MANY ADVANTAGES

ON CROPS, insect control is both safer and more effective with the new long-lasting Du Pont "Marlate" methoxychlor insecticide. It doesn't burn the most sensitive growth, such as cucurbits and tomatoes, and it can be used any time, even close to harvest, since normal residues it leaves are harmless to people and livestock.

AS A FLY SPRAY to use on the animals and in buildings, "Marlate" is highly recommended. It is the only residual insecticide recommended by the U.S. Department of Agriculture for use on dairy cows; controls hornflies, stable flies, houseflies, lice and mosquitoes.

FOR SUPPLIES of these and other Du Pont pest-control products, see your local dealer. Ask him also for free booklets giving full details on their use, or write to Du Pont, Grasselli Chemicals Dept., Wilmington 98, Del.; 152 Housel Ave., Lyndonville, N. Y.; 55 Maple Ave., Sodus, N. Y.; 34 Riverside Ave., Rensselaer, N. Y.

Listen to Du Pont "Cavalcade of America"—Tuesday Nights, NBC Coast to Coast

New **CASE**

3-Way

FIELD FORAGE HARVESTER

MODERN WAY TO MAKE LOW-COST HAY AND SILAGE

CORN SILAGE...

Built from the ground up for both row crops and hay crops, the Case Forage Harvester takes care of all needs on farms having both hay and silage. With row-crop unit in good corn or sorghum, under average conditions, it cuts 12 to 18 tons an hour, depending on yield and size of tractor used.

CHOPPED HAY...

For making chopped hay, either fully cured in the field or partly cured for barn finishing, the wind-row pick-up unit does a clean job. The all-steel knife wheel keeps on spinning to clear itself, avoids plugging. Over-running clutch prevents "pushing," lets knife wheel come up to speed before starting travel.

GRASS SILAGE...

The same strong, clean-working windrow pick-up handles hay cut for silage and wilted to the desired degree—enables you to save hay by ensiling when bad weather prevents curing. Cutter-bar unit will be available in limited numbers; it saves still more work where wilting is not needed.

New FORAGE BLOWER

This new Case blower has capacity to keep ahead of forage harvester. It puts up to 30 tons an hour of corn silage into a 60-foot silo when belted to a 3-plow tractor; also works well with 2-plow power. Spring-hinged hopper lets you drive right by—no backing with loads. Ratchet-driven wagon unloader available as an extra.

● The Case 3-way field forage harvester is easy-running—makes good use of 2-plow power, yet has capacity and mechanical strength to use the power of bigger tractors. All three crop units can be hydraulically controlled. With a Case blower and forage harvester you're equipped for all kinds and all forms of forage—whether you put grass or row crops into your silo, whether you cure hay in the field or mow. Send coupon, get full information.

PASTE ON PENNY POSTCARD

Mark machines that interest you; write in margin any others you need; mail to J. I. Case Co., Dept. D-11, Racine, Wis.

Revamping an OLD BARN

By Jared Van Wageningen Jr.

A FEW WEEKS ago the Dairy Committee of the Schoharie County Farm Bureau under the leadership of its efficient Manager, "Joe" Pendergast and his assistant, "Bill" Quinn, carried out a stable-inspection tour which in general interest and number participating must be declared an outstanding success. There was a dinner stop at the Lawyersville Community House where about 120 ate a cafeteria lunch of sandwiches, hot dogs, fried cakes and coffee.

The first visit was at the farm of Elmer Collins—this because the past summer he has built him a new barn which shows what can be done when one starts from the ground with all the knowledge which recent years has given us as to what constitutes correct planning. This barn, 110x38 feet, has tie-stalls for 40 milkers along with the necessary calf pens and box stalls. By accepted standards, a width of 38 feet is 2 or 4 feet wider than is economically advisable but Elmer feels that he wants room enough for his cows and space enough so that he is not obliged to cramp his style when he does his chores.

Ventilation Cures Dampness

The long motor cavalcade then halted at the farm of Claus Moldenhauer to see what could be done for a stable which had long suffered from wet and dripping ceilings and side walls. With the advice and assistance of the County Agricultural Engineer, John Scofield, a system of ventilating fans has been installed which Claus says has entirely corrected the old difficulty. In addition the visitors saw a bull pen which provides both convenience and safety in dealing with that most troublesome member of the dairy barn family.

A dairy tour of Schoharie County can hardly afford to by-pass the farmstead of Floyd M. Holmes & Sons. The big, dignified gray stone house has long been a landmark of the road and below it is the great barn, 210 feet in length with stabling for 140 milkers along with box stalls and bull pens. That is a pretty big operation, but it remains emphatically a family farm. Along with everything else which belongs with such a barn, it has a gutter cleaner and—something still unusual in our section of New York state—a silo unloader. Floyd reports that everything is working well.

From the Holmes' farm, it is only a long mile up the road to a most interesting project on the farm of Julius Gordon and Son. The father a good many years ago was cited as a Master Farmer by *American Agriculturist*. His son "Chet" (for Chester) may in theory be only the junior partner but I suspect that these days he is really the driving power behind the very ambitious venture. On this farm there has just been finished what is probably the most complete demonstration of the theory and practice of "pen-stabling" to be found in the state of New York. Chester himself is a product of the N. Y. State College of Agriculture with a boy's energy and enthusiasm and if there be such a thing as a "trailblazer", then he with his great new barn and

big trench-silo is making dairy history.

The tour turned in at our place for the one reason that during the past summer we did a pretty complete revamping of the stables in a barn which by no stretch of courtesy can be called new, and which according to modern standards of stable construction was a long way from what it ought to be. Our present barn was built 55 years ago and it replaced a conglomeration of old structures which I think for general craziness of arrangement would be hard to equal anywhere, any time.

Fifty odd years ago photography was not as casually practiced as today, so unfortunately we have no picture of it but even now with my mind's eye, I can see it as clearly as I saw it that May morning in 1895 when, the cows having been turned out to pasture, a half dozen carpenters swarmed over it as a wrecking crew. Here is an inventory of what they found. There was a cow-barn 60x30 with a lean-to along one side. There was a sheep barn of the same dimensions but without the lean-to. The two barns were forty feet apart and there was a shed connecting the two. This shed had a length-wise feeding alley with pens for colts on one side and sheep on the other. Then from the end of the cow-barn a separate stable extended out for forty feet so that the whole nondescript structure from one end to the other was just 200 feet long.

Under the sheep barn was a deep root-cellar. In the middle third of the past century, root crops were as popular as grass-silage is now. Each barn had a cupola with a weather vane. On the cow barn it was a golden calf and on the other a ram with a golden fleece—the two of them perpetually facing into the wind.

Too Narrow

When we built our present barn, we made two very fundamental mistakes which vexed us for many years and which seemed almost irremediable. The first was in trying to salvage timber from the old buildings. The wrecked structures had a lot of heavy cross beams thirty feet long and we used these in the new building thus restricting the width to that dimension. This was a pretty sad mistake but possibly excusable because a half century ago the dimensions and general plans for a cow stable were not so well standardized as today. Now we know that it needs 34 to 36 feet of width if you are to have two feeding alleys and mangers and cow beds and then an alley wide enough to drive through with a tractor and manure spreader.

The other mistake was serious enough although it was quite in conformity with the general recommendations of fifty odd years ago which greatly emphasized the advantages of the "basement" barn, meaning thereby a barn sunk in the ground to about half the height of the stable. The only advantage is warmth in severe weather and coolness in midsummer. Everything else about the basement idea is wrong.

Our old barn was set on a foundation

(Continued on Page 29)

Letters to the Editor

OLD FASHIONED HUSKING BEE

I THINK I can say something about old-fashioned husking bees, but maybe they are not as old as some people have attended.

We have had a few ourselves. First, we picked the corn in the field by hand, then we brought it to the barn and piled it in the middle of the barn floor, leaving room on both sides for the huskers who were, of course, both male and female. When a red ear of corn was found by one of the boys, the girls commenced to squeal and run. Today, I doubt if many people know what a red ear of corn means.

While the husking bee was going on the women were preparing refreshments. The menu usually consisted of 4 or 5 pots of baked beans, brown bread or white bread, pies, cakes and doughnuts, coffee and pickles. Over 100 persons were often fed at one of these husking bees. And they knew how to eat too!

At one of our husking bees we served the following: 25 pumpkin pies, 6 big loaves of cake, 12 or 15 dozen doughnuts, and 4 or 5 pots of beans. After everyone had eaten they all joined in some old-fashioned square dances. Two of these were called "Lady of the Lake" and "Boston Fancy."

We always planted the "King of the Corn Field." In Maine this is done by saving the best ears for next year's planting. — *George A. Marr, Pownall, Maine.*

INTERESTED WIFE

I WAS much interested to see in *American Agriculturist* a picture of an FFA president receiving an award in the National Chapter Contest. My husband, Charles F. Hess, is the "Ag" teacher at Mansfield Senior High School.

The Mansfield, Pa., FFA Chapter has been entered in the National Chapter contest the last two years. In 1948 the group received the Bronze Emblem Award (3rd) for the work they did in 1947-48.

In 1949 the group received the Silver Emblem Award (2nd) for their 1948-49 work. They have already entered the contest for 1950 with the hope, I believe, of getting a Gold Award or first place award.

Also, at the Harrisburg Farm Show the same group of boys received a second place plaque in the State Project contest. We are particularly proud of this because our boys, with one "Ag" teacher, placed only four points behind the first place school. That school was Trinity High with a much larger enrollment and three full-time "Ag" instructors.

I thought you might be interested to know we do things down on this end too.

I hope you can read this letter as I am recovering from an attack of polio and it is hard for me to write legibly. — *Mrs. Charles F. Hess, Mansfield, Pa.*

Editor's Note: We had no trouble in reading the letter. We think Charles is lucky to have a wife who takes such a keen interest in his work. We hope the boys will get busy and win that Gold Award.

— A.A. —

"You Can't Eat Grass" is the title of a profusely illustrated booklet about our livestock industry. Copies of it are available from the Public Relations Committee, *American National Livestock Association*, Ellensburg, Washington.

NORTHERN EDITION • APRIL, 1950

Nine Years of Bumper Crops Make Sprinkler Irrigation a "Must" with Wisconsin Farmer

Rice Lake, Wisc.—To M. F. Mommsen, of the Lazy A. Ranch, irrigation means profit. For nine years his portable sprinkler irrigation equipment has helped him produce record yields of top-grade crops.

Potatoes and rutabagas have the largest acreages at the Lazy A. "These two crops", Mommsen says, "have doubled and tripled in yield in the average season because of irrigation". In 1944 he ran a test, using identical plantings, "comparing irrigated potatoes which yielded 400 bu. per acre of good quality potatoes, with unirrigated... running 135 bu. of low-grade potatoes". Since then, his irrigated

M. F. Mommsen, at right with samples of his increased rutabaga crop, grown under sprinkler irrigation.

yields have topped 500 bu. per acre.

The Lazy A Ranch uses portable sprinkler irrigation equipment outfitted with lightweight, long-lasting aluminum pipe. "I would not think of going back to growing crops without irrigation equip-

ment", Mommsen adds. "And since aluminum lightweight pipe has been available, irrigating is the job our workers like the best of any." Mommsen purchased his equipment from the Moulton Irrigation Company of Withrow, Minnesota.

Take a "Rain Check" on those April Showers!

The first thing you'll need for successful sprinkler irrigation is an adequate, dependable, nearby source of satisfactory water. Usually natural streams or lakes will do. But sometimes they dry up during prolonged droughts. So many farmers have built 3 to 5-acre artificial ponds on their land to "save" spring rains. With your own reservoir, you're pretty sure to have plenty of water to irrigate crops during the dry summer months.

Irrigates Only Twice, Gets Four Times As Much Hay

Up near Ravenna, Michigan, a farmer bought a portable sprinkler system to irrigate cherries, strawberries and potatoes. Then he decided to try it on his brome-alfalfa pasture, too. During July and August he irrigated twice, using two inches of water each time. Look what happened! The irrigated brome-alfalfa mixture weighed *four times* as much as the unirrigated, and stood three times as high.

PICK THE PIPE THAT'S PORTABLE!

LIGHTWEIGHT, LONG-LASTING

ALCOA

ALUMINUM IRRIGATION PIPE

"SPRINKLINGS"

Since Alcoa irrigation pipe is so smooth inside, water flows through it with little resistance—requires less pumping power.

* * *

For overtree irrigation, sprinklers are mounted on aluminum risers as high as 20 feet.

* * *

An Ohio farmer reports: "We have irrigated sweet corn and, besides taking off nearly double the number of ears, every ear is a beauty. No nubbins!"

* * *

Alcoa aluminum pipe is made of alloy 63S-T6, a tough, heat-tempered metal designed to stand up under severe usage.

* * *

For local help in planning your sprinkler irrigation system, contact your county agent, state agricultural college, or reputable irrigation equipment supplier.

Aluminum Pipe Easy to Move Keeps Labor Costs Down

Moving your portable sprinkler irrigation system from one setting to another is a simple chore when it's equipped with Alcoa aluminum pipe. One man can carry two—or even more—sections at a time, because aluminum pipe weighs only about 1/3 as much as steel. Sections most commonly used are 20 to 30 ft. in length and 2 to 6 in. in diameter. Because of the light weight of aluminum, pipe diameters up to 8 inches are entirely practical. Quick-latching flexible couplings, fitted to the ends of pipe sections, make it easy to join or disconnect them—allow pipelines to conform to sloping or rolling ground.

Free Booklet Answers Many Questions About Irrigation

Would you like to know more about portable sprinkler irrigation systems? How they are making farms more profitable? What equipment is needed? How to install a system? How much a system costs? Something about sources of water?

These and many other questions are answered in this 32-page book, "Portable Sprinkler Pipelines to Profit". It's free; mail coupon today.

Sez Zeke: "I'm proud of my family as we walk along Main
All dressed like a million—thanks to BLENN on my grain!"

New Process
Blenn
Swift's
Specialized Crop Maker

Zeke likes to live in style. He knows that BLENN, Swift's specialized crop maker, helps make him the needed cash. There is no doubt that this superior plant food does earn extra money for growers of corn and other grains. A normal application means an investment of \$4 to \$5 an acre . . . but the increased yield New Process BLENN can give makes it a mighty profitable investment. This modern plant food actually lowers the cost of production per bushel. It helps to grow more from each acre you plant.

One thing that makes modern BLENN a better plant food is the new process used to manufacture it. Developed by Swift, this *exclusive* manufacturing method gives BLENN exceptional uniformity. First, complete mechanical mixing—then, complete chemical processing.

Like all Swift's Plant Foods, BLENN is now more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform freedom from caking, lumping, bridging; 3) uniform distribution through your machines; 4) uniform feeding of your crop throughout the entire season.

Use BLENN as a growth-promoting food for your grain. You'll get bigger yields, better crops. Order all you need of this modern plant food right away. See your Authorized Swift Agent about BLENN today!

SWIFT & COMPANY

Plant Food Division
Chicago 9, Ill.

Buy at the sign of the RED STEER

A Good Steer

Never make the mistake of thinking that a good commercial plant food, like BLENN, can do the *whole* job of increasing your crop yields. You also need a good soil management program. That calls for lime where needed—good rotations that include a legume—erosion control—good seed—drainage, if necessary, and good tillage. Remember to plow under barnyard manures and green manures.

* * *

America's greatest crop is probably our most neglected crop. We do mean *pasture* grass. It's relatively easy to turn a fair to poor pasture into a good one. Try an application of BLENN and watch for results.

Just listen to some of the results others are getting with BLENN.

"In 15 years of farming I have used many plant foods. Last year I found the answer to my plant food 'wants' . . . Swift's BLENN increased my yields by 10% per acre. Such an increase is high, as I have always followed good cultural practices. It's proof to me that BLENN is a superior plant food for grain."

Leon Hill, Sandy Lake, Pa.

FREE! We will gladly send you a 16-page booklet that gives the facts about BLENN. It's a real opportunity to cash in on the experience others have had with this specialized crop-maker. Write to Plant Food Division, Swift & Company, Chicago 9, Ill., and ask for it.

Growing Early Sweet Corn That's Free from Worms

By WILLIAM HARRY

County Agricultural Agent, Columbia County, N. Y.

IF SWEET CORN brings \$2.00 per 100 ears it will pay to dust to control corn borers." So says L. A. Carruth of the Geneva, New York, Experiment Station. Usually at the Menands market near Albany, the earliest clean sweet corn will bring from \$4.00 to \$6.00 a hundred; for wormy corn a grower is lucky if he gets 50 cents to \$1.00. A few bags of early worm-free corn will pay the cost of control and leave a profit.

There are various angles to controlling the corn borer. If all farmers would plow under the stubble completely before May 15 it would help greatly, but if one field in the neighborhood is left, there will be plenty of moths to infest a big area.

In the Hudson Valley and some other areas, sweet corn harvested in July and early August cannot escape the ravages of the corn borer. Some untreated fields are a total loss. By planting in late May or early June much of the injury can be prevented because the corn is not at the right stage when the moths are ready to lay eggs, and the corn is harvested before the second generation borers get in their work. However, it is the early corn which brings the money.

Spraying or dusting with DDT or a new product called Ryania is a third method of control and the principal one I will discuss. It can be used with success, particularly on high-priced, early sweet corn.

Dusting or spraying is usually started in June when the corn is at least 12" high. In some counties where it is important, the county agent will issue a warning to dust or spray; in other cases growers watch the corn plants, sometimes dusting when egg clusters are found on every other plant; sometimes when pinhole injury by the worms on the leaves is noticeable. In the Hudson Valley the date for the first application varies from June 8 to 21.

Egg Laying

The borer spends the winter as a larva or caterpillar in a corn stalk left in the field, in the corn stubble or possibly in weeds in the field or along its borders. Many borers perish during the winter, but, since one moth can lay 400 eggs, only a few need survive for a liberal infestation. In May it spins itself a cocoon and changes into a brown pupa. In a few weeks the moths emerge from the pupae and egg laying begins.

The eggs are laid in shingle-like clusters usually underneath the leaf. Early in the season the eggs are most often found on the lowest leaves, even those that are somewhat ragged. Sharp eyes are needed because the egg clusters are easily confused with thin mud splatters. Later eggs may be found anywhere on the corn plant.

When the eggs hatch, the tiny borers feed on the leaves, then crawl to the whorl of leaves and feed on the developing tassel. If you find pinholes in the corn leaf, unwind the whorl carefully and look for the black headed worms about an eighth of an inch long. After feeding in the tassel, the larvae move down the corn plant to burrow into the stalk or ear. Once the borer is in the stalk or ear, it is too late to kill it with insecticides.

The cost of material for spraying is usually less than for dusting. Two pounds of DDT wettable powder costing about 80 cents is enough to spray an acre once. Forty pounds of 5%

DDT dust, enough for an acre, costs about \$2.00. Ryania is somewhat more expensive but also more effective. Some growers get excellent control by alternating use of the two materials. Stalks dusted with DDT should not be fed to cattle; Ryania is perfectly safe.

A Valatie, N. Y. grower who seldom has to throw out an ear of corn, dusts whenever there is no wind, whether there is a dew or not. Corn does not need to be wet when dust is applied. Mid-day dusting has another advantage; the stalks are warm and will bend without breaking when the tractor is driven over them. This grower sets the duster nozzles carefully directing the dust into the whorls of the corn, then he drives the tractor slowly enough to put on forty to fifty pounds of dust per acre. He stops and checks now and then to see that the dust is going into the whorls and leaf axils. Five days later he puts on a second dust. Four applications are usually needed five days apart. Occasionally a fifth application may be necessary if egg laying continues longer than usual.

Success from Perseverance

Experienced growers say that keeping strictly to this *five day* interval is necessary for good control. If the interval is more than five days borers will hatch and get into the corn before the next dust is put on. Also, new growth is unprotected.

The home gardener can have clean corn, too. It is easy to dust a garden patch with a good knapsack duster. Control will be even better than in the field.

On Long Island, in the Hudson Valley, and in some other areas where there are two generations of corn borers a year, the eggs for the second generation are laid in early August, and the corn that matures in September may be very wormy. It is difficult to control this generation in large fields because the corn is so high that machines used for dusting will usually break down the stalks. Some trials have been made of airplane application of dust and this method of application may grow.

It has been definitely established that housewives are not anxious to buy wormy corn which contains the European corn borer, or corn ear worms, the control of which is another story.

It is by no means true that the control of the European corn borer on sweet corn will be profitable in every case, but it is certain that sweet corn so wormy that it isn't worth picking can never be profitable.

"Gawsh, you scared me. I thought it was my wife!"

Successful Fruit Growing Depends on Orchard Soil Culture

By E. STUART HUBBARD

President, New York State Horticultural Society

SUCCESSFUL fruit growing must depend largely upon the soil management in the orchard. The deeper, better drained soils show the results of poor management more slowly or less frequently than the shallow soils underlaid with rock or hardpan. But, even our best soils, in time, become lacking in humus and in the living quality essential for the production of fruit of the finest quality and flavor.

In fact, it would seem that many of our problems of stippen, brown core, internal cork, internal breakdown, storage scald and weak tissue, as well as abnormal dropping and lack of color, increase as our soils become less normal in humus content and organic quality and as their chemical and physical conditions deteriorate. There are indications that fungus diseases and sucking insects are more difficult to control under these abnormal conditions.

A Normal Soil

In order to secure or maintain normal orchard soils and to revive depleted soils, it is necessary to know what constitutes a normal soil for fruit trees, the type of soil condition in which our fruit species have evolved and survived through countless generations.

We find that in nature the most healthy growth, the best development and the longest life occur with those trees that grow in certain types of soils in association with a variety of other species; and with a soil cover undisturbed by fire or by overgrazing by heavy animals.

In such a soil cover, the leaves and debris from neighboring trees and plants and the excrement and remains of animals and insects provide plant food in a digested, blended form. It is derived from soil minerals from various depths depending upon the varied ability of many plant species and many forms of animal life to break down soil minerals, absorb them and make them available in decaying root or surface litter.

In nature's processes such soil is kept in good condition of drainage and aeration; moisture is absorbed and retained; there are no abrupt variations in available nitrates and other food elements, except in extreme drought or flood or when disastrous freezes damage wood cells to prevent normal sap flow.

Adding Humus

Some 20 years ago we found our orchard soils low in humus following intensive tillage for many years. Lack of summer moisture in most seasons ruled out the growth of heavy cover crops or sod as a means of building organic matter, both under the trees and in the open. It seemed wise, therefore, to bring organic materials into the orchard and to use all available fertilizer funds for mulch and manure. Some orchards were so lacking in humus that we broadcast five tons of hay mulch to the acre beyond the branches to encourage sod as well as tree growth. Mulch was not put beneath the trees until the broadcast mulch had disappeared, replaced by a rich sod self-seeded from the clovers,

grasses and weeds from the mulch and the sod. This delay lessened fire hazard.

We soon found that this treatment quickly changed the quality and texture of the soil. There was no water run off or erosion, even on steep slopes, and there was less drought injury. Wild White, red and alsike clover came in automatically when we used limestone and phosphate.

The type and quality of twig growth changed, as did the color, firmness and flavor of the fruit. More plentiful fruit spurs with shorter terminals gave more regular fruiting.

When moderate, occasional applications of manure have been made on the sod, the trees and fruit have responded splendidly and the sod has gained in vigor.

One broadcast mulch application is usually sufficient to revive the natural soil processes so that the mowings left where they fall, plus occasional light manure dressings, maintain a good growth of sod and tree.

Orchard Grass Sod

Fearing depletion of wild bees and insects, helpful in pollinating not only apples but also other fruit and field plants, we have attempted to shift from clovers to orchard grass by disking the sod, broadcasting seed and following with the cultipacker. This has been quite successful. We like orchard grass because: 1. It is deep-rooted; 2. It brings up lower soil elements to become available for surface roots; 3. It penetrates the plow sole, thus aiding drainage and aeration; 4. It occupies only part of the surface, thus leaving spaces mulched by the decaying side growth and mowings, permitting the tree roots to come to the surface for air and for plant food; 5. It grows rapidly in the spring, pumping out excess water while growing less vigorously in the summer; 6. It remains green, causing less danger from fire. It is well named "Orchard Grass."

After many years of such treatment, orchards settle down to a normal type of growth, productivity and quality of fruit.

Some growers apply a moderate depth of mulch under the trees annually so as to maintain a depth of two to four inches. In such cases, earthworms persist in spite of spray materials, and forest cover conditions are approximated. This is especially so when a variety of mulch materials from different species of deep and shallow rooted grasses and legumes is used. When mulch materials are from fertilized, limed fields, a normal balanced supply of food elements is maintained in the mulch residues which are broken down and blended by the earthworms and other soil organisms. Dolomite limestone may be used to neutralize the effect of sulphur or other spray materials. It is interesting to note, however, that a mulch cover on a good sod acts as a buffer between chemicals, heat and cold, excess moisture or extreme drought, and the roots of trees, soil organisms and available minerals.

By keeping ever in mind the conditions natural to fruit trees we can plan our operations to approximate them, watching the trees for indications of lack or excess of nitrogen or other elements or factors.

➤ Gentler Handling ➤ Faster Speed
➤ Easier Work ➤ Higher Profits

New DEARBORN HAY TOOLS FOR THE FORD TRACTOR

When hay is ready, be first in the field . . . with the Ford Tractor, new Dearborn Rear Attached Mower and new Dearborn Heavy Duty Side Delivery Rake. They get you started in a hurry with quick attaching and fast transport. Then, mowing and raking go faster due to sturdy design of these Dearborn Implements for trouble-free operation and swift, easy handling by the Ford Tractor. There's a big difference, and your Ford Tractor dealer will prove it for you.

DEARBORN MOTORS CORPORATION • DETROIT 3, MICHIGAN

New! Dearborn Heavy Duty Side Delivery Rake (Shown above)

Has 8 ft. raking width, produces approximately 30 acres per day of well formed, quick drying windrows. Gentle on hay, due to new tooth action and smaller angle of the reel to windrow. Full floating reel is lifted, lowered by Ford Tractor Hydraulic Touch Control.

New Dearborn Rear Attached Mower

Attached to Ford Tractor in a matter of minutes, detached in even less time! New drive reduces vibration to a minimum. Cutter bar lifts, lowers by Ford Tractor Touch Control; releases if obstruction is hit.

Dearborn Sweep Rake

This well proved profit maker sweeps 10 ft., 6 in. wide, lifts 500 lbs. by Ford Tractor Hydraulic Touch Control, dumps load by lowering rake and backing tractor.

See your Ford Tractor dealer

Your nearby Ford Tractor dealer will gladly demonstrate the advantages of making hay with the Ford Tractor and Dearborn Implements. Drop in or phone him!

"Freed from NERVOUS WORRY"

"My nervous state was due to drinking coffee. Switching to POSTUM calmed me—I stopped worrying and began to really enjoy life!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine—a drug—a nerve stimulant. So, while many people can drink coffee or tea without ill-effect—others suffer nervousness, indigestion, sleepless nights... POSTUM contains no caffeine or other drug—nothing that can possibly cause nervousness, indigestion, or sleeplessness.

MAKE THIS TEST: Drink POSTUM exclusively for 30 days—judge by results!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran.

Pen Stable Experience Reports

By Jim Hall

IT'S a little better than three years since health authorities decided they would permit the shipment of milk into New York City from a limited number of New York farms on which cows were pen stabled. To date, 83 pen stable dairies have been approved.

With the experience they've had, how do these 83 men like pen stabling? How big are their herds? How much space do they allow per cow? What about cleaning the pen? Have they had more or less mastitis and do they think cows are more apt to have it under pen stable conditions? Does production drop or disease increase with sudden temperature drops?

We have answers to the above questions from 43 of the men operating approved New York City pen stables. Some have housed cattle in pens for 25 to 30 years but most have had just a little less than three years' experience.

The penned herds range in size from 8 to 75 cows, averaging 27.4. Cows have anywhere from 70 feet of space each for some Jersey herds, up to 300 feet in some barns where they plan to increase the herd. More than half the pens are completely cleaned out only once a year—in the spring. A few clean out the pens as many as four times during the winter.

Less Mastitis

Four of the men have always had pen stables and could give no comparison but of the 39 who have had both types of housing, 36 or 92.3% have had less mastitis, two have found it about the same and one had more but doesn't blame it on loose housing. When asked if they thought there was more apt to be mastitis in a pen stable, every man except one said, "No." The exception said that whether cows were in pen or stanchion, the incidence of mastitis largely depended on the management of the farmer himself.

None reported any increase in disease and only 12 said there was any drop in production due to quick drops in temperature. Of these 12, several added that the drop wasn't any more than they would have experienced in conventional type barns.

The following reports are from individual operators who have taken time to pass along to other *American Agriculturist* readers, their own opinions of pen stabling after several years' experience:

First Approved Pen Stable

H. R. Sanford of Bath, Steuben County, has stabled his Lyon Homestead dairy in a pen for 27 years. His was the first pen stable dairy approved for shipment to New York and he has this to say about it:

"I found 27 years ago that I was having too much bag injury. A cow would step on teats next to her and bang! a quarter went. So then I tried keeping cows in stanchions only while eating grain and silage and being milked, and let them out in the loafing pen the rest of the time. The pen has feed racks all around the outside, running water, plenty of windows and a big door on one side to control temperature. I find it takes about twice as much bedding in order to have a dry, deep bed but even on zero days it is pure happiness for the cows lying deep in a dry bed.

"I do not recall a single case of mastitis since changing over but did find that horns and pen stabling do not work. I've had some nasty work from horns, but once removed from a boss cow there's no more damage from her.

"Production in my registered Jerseys has increased from Record Club test average of 264 pounds of fat to a 1949 pure breed dairy cattle diploma of 479

pounds average. I don't claim pen stabling has done it all but it has given me a healthier herd which has been a big factor in this gain. I hold an accredited herd certificate for TB and an approved herd certificate for Bangs; and just yesterday the State vet was here and checked all cows for mastitis and never found a suspicious quarter. It's pen stabling for me as long as I keep cows."

30 Years Experience

G. Ralph Buckland of Perry, Wyoming County, has had a pen stable 30 years and says the nearest approach he's had to mastitis is a little thick milk occurring every three or four years. He has a production drop when real cold weather comes along but believes it might be caused by the fact that at milking time they empty the pen because they have stanchions enough to hold all the cows at once. "The empty pen cools off too much during milking time in zero weather but the cows stay healthy regardless. We like to leave a good space, well-bedded for the cows to lie in and we clean out often in front of the feed rack. We pick a nice day about 3 times a year to completely clean the pen—I feel sorry for the fellows who have to clean out every day regardless of weather."

Healthier in Pen Stable

Robert O. Knapp and Sons at Preble, Cortland County, have both a pen stable and a conventional barn. They say, "We have to be much more careful with management in the conventional barn. Cows are healthier in the pen stable."

(Continued on Page 15)

SETS NEW AYRSHIRE LIFETIME RECORD

A 16-year-old Ayrshire cow, Delchester Audacious Netty 2nd, owned by William H. Ashton, Edgemont, Pa., has set a new all-time lifetime record in both milk and fat for the Ayrshire breed in the United States as her cumulative total reached 204,054 lbs. of 3.93% milk and 8020 lbs. of fat in 4536 days, of which 2118, to be exact, were on a three time daily milking schedule.

These credits place Audacious Netty 2nd above Strathglass Lucky Puff, the former fat champion that has cumulative credits of 189,846 lbs. of 4% milk

Delchester Audacious Netty 2nd has set an all-time U. S. lifetime record for Ayrshire breed.

and 7598 lbs. of fat. "Netty" also displaces Barclay's Betty, former record milk producer with 201,457 lbs. milk and 6881 lbs. fat.

Bred and developed in Ashton's Delchester herd, "Netty 2nd" is the dam of nine registered daughters and two sons. Her seven tested progeny (six daughters and one Approved son) have given their dam an Approved rating with an average of 9269 lbs. 4.03% milk, M. E. 2x, 305 days.

At twelve years of age, this grand matron actually produced 18,718 lbs. of 4.01% milk and 750 lbs. of fat in 305 days on two milkings daily.

MORE POWER *than ever!*
GREATER VALUE *than ever!*

Who Works Harder Than a Farmer?

What Works Harder Than a Chevrolet Truck?

Chevrolet P-L trucks were built to work. With the most powerful engines ever built by Chevrolet, they have what it takes to handle your hauling jobs—faster, better.

Chevrolet P-L trucks are built to last. Their advance design and sturdy construction take tough loads and the roughest roads.

Chevrolet P-L trucks are far ahead. Check them for payload, performance, popularity, price. They are far ahead in every feature that matters to farmers.

Chevrolet P-L trucks are better than ever. Always powerful, always a buy, now they give you more power and greater value than ever.

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

P•L*

ADVANCE-DESIGN TRUCKS

*** Payload Leaders**

For low operating costs per ton mile, smart buyers choose Chevrolet P-L trucks. They are advance designed to cut running and repair costs. Their rugged construction lets you deliver the goods with real reductions in operating expense.

*** Performance Leaders**

On the hills or on the straightaway, the efficient new Chevrolet P-L trucks are far ahead in performance. They give you high pulling power over a wide range of usable road speeds—and high acceleration to cut down total trip time.

*** Popularity Leaders**

In every postwar year truck customers have bought more Chevrolets than any other make of truck—convincing proof of the owner satisfaction they have earned through the years—proof that Chevrolet is America's most wanted truck.

*** Price Leaders**

From low selling price to high resale value, you're money ahead with Chevrolet trucks. Chevrolet's rock-bottom initial cost—outstandingly low cost of operation and upkeep—and high trade-in value, all add up to the lowest price for you.

Plus all these Plus features: TWO GREAT VALVE-IN-HEAD ENGINES: the new 105-h.p. Load-Master and the improved 92-h.p. Thrift-Master—to give you greater power per gallon, lower cost per load • THE NEW POWER-JET CARBURETOR: smoother, quicker acceleration response • DIAPHRAGM SPRING CLUTCH for easy action engagement • SYNCHRO-MESH TRANSMISSIONS for fast, smooth shifting • HYPOID REAR AXLES—5 times more durable than spiral bevel type • DOUBLE-ARTICULATED BRAKES—for complete driver control • WIDE-BASE WHEELS for increased tire mileage • ADVANCE-DESIGN STYLING with the "Cab that Breathes" • BALL-TYPE STEERING for easier handling • UNIT-DESIGN BODIES—precision built.

*I'll take DeKalb
everytime...*

If "Bossy" could talk, we bet that's what she'd be saying. And for good reason. DeKalb silage varieties adapted to New York farm-lands produce fine, rich silage. Silage with high feeding value per ton . . . lots of feed per acre. Don't wait! See your DeKalb dealer NOW! Get the DeKalb silage varieties best suited for your farm.

HERE'S WHY NEW YORK FARMERS LIKE DEKALB FOR SILAGE . . .

"We like the way the ears on our DeKalb corn mature while stalks are still green. We've planted DeKalb for eight years."—Eisenbut brothers, Oneida county.

"In five years, including two wet years and one scorcher, we've always filled our silos—with DeKalb."—C. J. Marsh, Ontario county.

"It's heavy. It's good feed. It's easy to handle. DeKalb silage corn can't be beat in this area."—Erich Cottrell, Seneca co.

"I like DeKalb Hybrid corn for silage because of its nice broad green leaves. There's real feed in DeKalb silage."—S. T. Hall, Dutchess co.

"Off of one five acre field of DeKalb corn we got 110 tons of silage, this year. That's hard to beat."—J. E. Hughes, Deansboro.

DEKALB AGRICULTURAL ASSOCIATION, INC., DeKalb, Illinois
Commercial Producers & Distributors of DeKalb Hybrid Seed Corn.

More Farmers Plant

than any other Hybrid

Finest of all low cost tractors. Plows, discs, harrows, mows, saws, plants, hauls, etc. Has draw-bar pull for many jobs. Powerful, economical and super durable. Smartly engineered. Makes play out of hard irksome jobs. Excellent working visibility. Honor built. Designed for farmers, truck gardeners, private homes, estates, etc. Adjustable wheel widths. 16-inch row clearance. Has 3-speed Warner transmission, Rockford Clutch, 2 individual brakes, large roomy spring supported seat, Plow lift, auto type steering. Sold only direct to user at unusually low price. Prompt shipment. FREE details. In our 46th year. OTTAWA MFG. CO. 1-031 Garden St., Ottawa, Kan.

Control Weeds with Chemicals

By J. D. VanGELUWE and A. J. TAFURO

TODAY chemical weed control offers opportunities for bigger yields at lower costs. Many of the earlier problems have been solved by careful experimental work. One new tool has been the use of radioactive tracers by which the absorption of a material such as 2,4-D and its movement through the plant can be traced.

The use of ester forms of 2,4-D produced injury to test tomato plants 48 hours after application up to 192 feet from the sprayed field as tested last summer by the writers. This work is good evidence that the amine salt forms are safer to use near to susceptible crops than ester forms of 2,4-D.

Sweet and Field Corn

Application of 2,4-D can be made after planting but before any corn breaks through the soil. This is referred to as a pre-emergence treatment. This type of spray will control weeds and early annual grasses until corn gets 3" to 6" high, and avoid one or two cultivations when the corn is small. Injury from cultivation at this stage is always a factor. Use 1 lb. of the salt form of 2,4-D per acre; if annual grasses are a problem 1½ lbs. can be applied.

In years when weeds are a serious problem, a pre-emergence treatment can be followed by a post-emergence treatment if necessary. 2,4-D can be applied to corn from 3" up to 1 foot high and at these heights the spray can be directed over the corn plants to cover the entire field. Spray should be applied when weeds are small and actively growing. Applications of ½ lb. of salt form of 2,4-D per acre should be used, and, whenever weeds are a problem, yield increases can nearly always be measured even if slight injury can be seen on the corn. Many growers have reported that they have successfully controlled weeds in corn with increased yields by using 2,4-D. Sweet corn such as Seneca Dawn, North Star and the very early maturing varieties should not be sprayed with 2,4-D since they are very susceptible to 2,4-D injury.

Small Grains (Not Seeded)

Chemical weed control in small grains, not seeded, offers the simplest and safest crop for using 2,4-D; mustard and most other weeds no longer need be a problem in non-seeded grains. In the past four years, 2,4-D used in spring grain (not seeded) has given little or no injury to grain and in most cases yields were increased. Spray should be applied when the grain is 3" to 6" high, or fully tillered, up until two or three days before boot stage, at a rate of ½ lb. of salt form of 2,4-D per acre. If mustard is the only problem, ¼ lb. of salt form of 2,4-D could be used if the spray is applied when weeds are small. Most effective "kill" of weeds is obtained when weeds are small and actively growing.

In some cases "hard to kill" weeds such as thistles are a problem and it may be necessary to "spot treat" these areas with higher concentrations of 2,4-D. This should be done only in the areas of the fields where the "hard to kill" weeds are present.

For fall planted grains, not seeded, application of 2,4-D should be made in the spring only, since injury may occur when treated in the fall.

Grains (Seeded to Legumes)

Many seeded grain fields throughout the Northeast have a serious mustard problem. 2,4-D has given good results particularly with grain seeded to ladino, medium red, mammoth red and

alsike clovers. Alfalfa and sweet clover are more susceptible to 2,4-D than the other legumes mentioned. Seeded grain crops severely infested with mustard can be treated with low concentrations of ¼ lb. of the salt form of 2,4-D when mustard is in full bloom and grain fully headed, at least beyond the soft dough stage.

It is suggested that the spraying of seeded grains be tried on a limited acreage since some reduction in the legume stand may occur, more particularly with alfalfa. Past experience has shown that legume stands recover when spray is applied at the proper time with the proper concentrations of the salt form (not ester) of 2,4-D. Application should be made with a low volume of not more than 4 to 5 gallons per acre. A slight reduction of stand of legumes may occur, but with an infestation of mustard severe enough to warrant spraying, legume stands are seriously affected by weed competition.

Potatoes

Applying a chemical herbicide as a pre-emergence treatment on potatoes has given excellent control of weeds with no injury to potatoes. Controlling early weeds and grasses is a costly production item and early cultivation in practically all cases will damage the young plants. For the past four years, Sinox General, a dinitro material has given excellent control of weeds on many different soil types and under various extremes of climatic conditions and in most cases yields were increased.

Application should be made after planting and about two or three days before any vines break through the soil. Three pints of Sinox General with five gallons of diesel oil per acre can be applied at a total volume spray from 25 to 125 gallons per acre according to equipment used. Conventional potato spraying equipment can be used since this material can readily be cleaned from the spray equipment. This material can be applied to any soil types, except muck soils.

In many cases a pre-emergence treatment can control weeds without cultivation until hilling time.

Brush Control

Woody plants in many cases are a serious problem on farms since they take valuable acreage out of production. 2,4-D in previous years was used with success on some species of woody plants, but many species were not successfully controlled. For the past four years mixtures of 2,4-D and 2,4,5-T have been tested with good results and today are being sold commercially. Best results can be expected when these chemical brush killer mixtures are used at the time the brush is in the full leaf stage. Brush should be sprayed when

(Continued on Page 14)

The Question Box

How does a grass mixture for lawns differ from one intended for meadows or pastures?

Seedsman generally agree that a lawn seeding mixture should contain at least 55% by weight of grasses and clovers that make a turf; in other words, spread by root stalks. If you try to save money when you buy seed for a new lawn you will get a high percentage of grasses such as redtop and timothy which do not make a satisfactory sod.

Where a dairyman is vaccinating calves to control Bang's disease, what is the object of blood testing and selling reactors?

So far as any state program is concerned, the ultimate goal is to eradicate the disease. To do this in any herd it is necessary to dispose of reactors. It is true that some animals may react permanently as a result of the vaccination but there is also the probability that some reactors will spread the disease.

There are, of course, some dairymen who vaccinate without blood testing, but this is a sort of "shotgun" treatment and the herd owner never knows the exact situation in his herd.

What do you consider the best legume to plant with Sudan grass?

The best legume to grow with Sudan grass is soy beans. However, Sudan grass is coarse and difficult to cure even when grown alone, and soy beans are even more difficult to cure than Sudan grass. I would much rather put the mixture in the silo than attempt to cure and bale it.

If you are interested though, the seeding rate per acre should be about one and one-half bushels of soy beans for fifteen pounds of Sudan grass. I don't know of any other legume that you could grow with Sudan grass that would be at all satisfactory from a yield standpoint. A combination of Sudan grass and German millet would be a little easier to cure than straight Sudan grass, but the quality of the hay would not be as good.

You also ask about the difference between sweet Sudan grass and plain Sudan grass. Sweet Sudan grass has a higher sugar content and is considered somewhat more palatable to stock. I doubt if this is too important a point since it is seldom that we have any trouble getting cows to eat ordinary Sudan grass. Sweet Sudan grass is really a cross between sweet Sorgham and ordinary Sudan, and as a result its prussic acid content is somewhat higher than ordinary Sudan. In trials at Cornell the ordinary Sudan has outyielded the sweet and has been ready for grazing sooner after planting. In the South the edge seems to be to sweet Sudan, since they have a longer season.—George H. Serviss.

Do you have an up-to-date schedule of prices to be charged for custom work with farm machines?

The following figures are supplied by C. A. Bratton of Cornell and are the average rates charged by Michigan farmers last year. At least they can serve as a guide.

Operation	Hourly rate	Acre rate	Average per day
Cultivating (2 row)	\$3.00	\$1.00	20
Drilling grain	3.00	1.50	20
Drilling beans (2 row)	2.50	1.75	15
Planting corn (2 row)			
without fertilizer	3.00	1.25	20
with fertilizer	3.00	1.50	17
Planting potatoes (2 row)	4.00	3.50	11
Spraying potatoes	3.00	2.00	—
Mowing hay (6 foot)	2.50	1.25	19
Raking hay (side del.)	2.50	1.25	26
Chopping hay (1 man)	8.00	—	9
Cutting grain (6 foot)	—	2.00	12
Cutting grain (8 foot)	—	3.00	16
Combining grain:			
3 1/2-4 1/2 foot combine	4.50	5.00	8
5 foot combine	5.00	5.00	11
8 foot combine	6.00	5.00	12
Picking corn (1 row)	5.00	5.00	8

Field baling custom rates for hay and straw ranged from 10 to 16 cents per bale. Average machinery rental rates per acre were reported as follows: grain drill \$.65, bean drill \$.75, corn planter \$.85, potato planter \$1.85, lime spreader \$.40. Tractor rentals were \$1.50 per hour for 1 plow and \$2.00 per hour for 2 plows.

U. S. farmers are now using twice the tonnage of commercial fertilizer used before the war.

LONG DISTANCE ARTIFICIAL BREEDING

—Photo by C. Hadley Smith

THE most distant shipment of bull semen to leave Ithaca, N. Y. East Hill Airport was flown out on Robinson Airlines Flight 3 last month. It was bound for Boise, Idaho, via air parcel post, special delivery.

The shipment, originated by Lewis S. Bell at his Lawara Farms near Interlaken, N. Y., was scheduled for delivery at the office of the consignor, Orville H. Baldwin, at Eagle, Idaho, a suburb of Boise, at 10 a.m. the next day.

Taken from Glenafton Rag Apple Regent, a Holstein bull five years old,

the semen was placed in vials which were wrapped with two containers of ice and enclosed in a heavy cardboard carton. This type of packaging is adequate for maintaining a temperature of approximately 40 degrees Fahrenheit for about four days.

Witnessing the departure of the record shipment were: left to right, Captain Walter Reed, pilot of the Air Chief transport; Mr. Bell, Lee Wilson, post-office representative receiving the air parcel post special delivery package, and Ralph C. Smith, secretary of the Ithaca Chamber of Commerce.

MINRALTONE HELPS BUILD CHAMPIONS

Here's Crescent Beauty Lady Gloria, All-American Three-Year-Old Heifer of 1949. She's also First Prize, Senior and Grand Champion at the National Cattle Congress, first and Reserve Grand Champion at the International Dairy Exposition, first in open class and Wisconsin Champion Cow at the Wisconsin State Fair, Grand Champion and first for Best Uddered Cow at Waukesha Dairy Show — all in 1949.

Crescent Beauty Holsteins Protected Against

HIDDEN HUNGER*

Crescent Beauty Farm, Ft. Atkinson, Wis., is the home of Allen Hetts' famous Crescent Beauty Holsteins, well known for their excellence — particularly Crescent Beauty Lady Gloria.

Mr. Hetts, owner of the Farm, has been feeding MinRaltone regularly for more than three years. "My entire herd is fed MinRaltone," says Mr. Hetts. "We premix it, to protect them from mineral deficiencies and to help maintain peak condition and reproduction. Our results have been consistently good."

Now is the time to help safeguard your profits and the health and continued productivity of your stock. Follow the lead of successful dairymen — feed MinRaltone to your herd. MinRaltone protects against Hidden Hunger* because it contains 11 essential mineral elements with Vitamin D. Write for free MinRaltone feeding booklet and complete details.

MANY NEVER SUSPECT CAUSE OF BACKACHES

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief — help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

With DITHANE on hand you need no other fungicide. DITHANE sprays or dusts, used regularly throughout the season, stop potato blight before it starts!

DITHANE gives you *bonus bushels* too. For DITHANE's safety to foliage, vines and blossoms means potatoes of *finer* quality and *more* of them. In hundreds of side-by-side practical field comparisons, crops sprayed or dusted with DITHANE have outyielded crops treated with other fungicides—usually by 40 to 70 bushels per acre.

Thoroughly proved by thousands of farmers on thousands of acres of potatoes, tomatoes, celery, cantaloupe and other crops, DITHANE sprays and dusts are available from dealers throughout the country. See your dealer soon for your requirements.

Spring Crop and Garden Reminders

NITROGEN FOR OATS

WITHIN THE past few years, more emphasis has been placed on mixed fertilizer containing nitrogen for oats. There are sound reasons for this. Varieties of oats we are growing today are much stiffer strawed than old varieties. They are also much more rust resistant. Nitrogen is not only much less likely to cause lodging, but resulting yield increases are much less likely to be limited by rust.

In the absence of rust and serious lodging oats respond well to comparatively heavy applications of nitrogen. Another favorable factor is that Clinton and Mohawk varieties being shorter strawed than old varieties are much less likely to smother the seeding. Heavy use of nitrogen does, though, seem to have an adverse effect on seedings made with the oats.

Not every farmer should use a mixed fertilizer containing nitrogen for oats, but many will find it profitable. It's hard to define just where the dividing line between the use of a moderate amount and little or none should be. Probably the amount of manure applied last year for corn or some other crop is one fairly good guide. If 15 to 20 tons of manure was applied, we would question the use of much nitrogen for oats. If no manure was applied, a fertilizer such as 10-10-10 is likely to be in order. If from eight to 12 tons were applied, fertilizer such as 6-12-6, 6-18-6, 4-12-8 and 5-10-10 would be a good choice.

—George Serviss

—A.A.—

TEN POINT TOMATO PROGRAM

"The production of processing tomatoes in Delaware is one of our most important industries," writes Robert F. Stevens, Extension Horticulturist. For many years, yields in the State have averaged less than 5 tons. If the tomato-growing business is going to be profitable, higher yields must be grown. Stevens outlines the following 10-point production program designed to produce 10-ton yields:

(1) Use good soil; (2) fertilize properly; (3) use starter solutions; (4) space plants close; (5) grade your plants; (6) plant early; (7) control insects; (8) control diseases; (9) pick crop promptly; (10) control weeds.

On fertilization, Mr. Stevens recommends an application of 1,200 lbs. per acre of a 5-10-10 or 4-8-12 fertilizer. This fertilizer should be plowed under just before planting time. This, in his opinion, will give the greatest benefit from the fertilizer and allow the cover crop to reach optimum size.

The value of manure to increase yields is recognized. If poultry manure is used, apply up to 10 tons per acre. Whichever manure is used, supplement with about 600 lbs. of either of the above analyses.

Sidedressing, according to this authority, may be helpful in increasing the size of the fruit and the capacity of the plant to continue producing blossoms and setting fruit. Three hundred lbs. per acre of a 10-0-20 fertilizer applied after a good crop is set will help increase yields further.

—A.A.—

ASPARAGUS IS NOW EASY TO GROW

Asparagus used to be the hardest vegetable to plant and grow; now it is the easiest. All that is necessary for home garden use is to set roots right at the surface just like cabbage or tomatoes and see that the ground isn't left bare around it during the winter; the ideal way is to mulch it right from the start with manure and keep that mulch there all the time. This method of planting is new, but it has been

thoroughly tried and is now beginning to be taught for home garden use at the agricultural colleges. It is not for commercial growers because they use the disk harrow over the bed and therefore must set the plants deep. But it is proving to be a boon to the home garden.—J. A. Eliot.

—A.A.—

FERTILIZERS FOR DRY BEANS

The three most commonly used analyses of fertilizers on beans in New York are 5-10-5, 4-12-4, and 3-12-6. Very few farmers use over 400 lbs. per acre; the average is about 300 lbs. This may be sufficient on land heavily fertilized the previous year, on a good legume sod, and on land heavily manured. However, on soil of low fertility, deficient in organic matter, and on land previously in old sod or small grain, tests indicate that more fertilizer is justified.

Field tests have generally shown that broadcasting before plowing gives better results than broadcasting after plowing. It is never safe to apply fertilizer through the same spout with the seed. Best results are obtained by placing it two inches away from the seed and about two inches deep.

—A.A.—

JUNIOR VEGETABLE GROWERS' CONTEST

The National Junior Vegetable Growers Association has again announced its 1950 program, an important part of which is the annual Production Marketing Contest for members. This contest has been conducted for 10 years and there will be more than 200 awards with a \$500 scholarship going to the national champion.

Contestants plant a vegetable garden, keep careful records on it, and in the meantime make a careful study of marketing procedures. Any young reader who has an interest in this contest can get further details from Professor Grant Snyder, University of Massachusetts, Amherst, Mass.

—A.A.—

CONTROL WEEDS WITH CHEMICALS

(Continued from Page 12)

it is less than 6 feet tall and, when it is more than this height it is advisable to cut and spray the stubble to avoid resprouting.

Many of the commercial mixtures of 2,4-D and 2,4,5-T used for brush control are made to emulsify in water as a water spray and to mix with diesel oil or kerosene.

Poison ivy has shown better kill when sprayed in mid-summer to early fall, than when sprayed in early spring. Cut stumps can also be treated with the 2,4-D and 2,4,5-T mixtures in diesel oil and can be applied by a knapsack sprayer equipped with a fan nozzle of medium orifice. Cut stumps can be sprayed at any time of the year. Material should be sprayed thoroughly on the tops and sides of stump and you can re-treat the few stumps that may re-sprout the following spring after they come into full leaf. Re-sprouting of stumps is reduced as much as 80% with one application.

Equipment

Chemical weed control equipment for spraying 2,4-D is now readily available. There are many different types and models, ranging all the way from large, trailer-mounted units complete with tank, pump and motor for large operations down to the more economical tractor-mounted equipment available now at very moderate prices. It is no longer necessary to have large acreages to warrant the investment necessary for 2,4-D application equipment.

WE GUARANTEE YOU'LL PICK THESE

EVERBEARING STRAWBERRIES IN 90 DAYS

FAMOUS GEM EVERBEARING. Stern's takes the risk out of gardening. You'll pick these big juicy strawberries by July—or your money back! Every plant unconditionally guaranteed to bear—will start by July and continue bearing until freezing weather. Big, firm, round berries. Extra juicy, extra rich flavor, very sweet. Make mouth-watering short-cakes, pies, jam, irresistible with cream. Next year and after they'll bear earliest and continue right up to freezing time.

PEN STABLE EXPERIENCE REPORTS

(Continued from Page 10)

We have found it advantageous to put some of our larger cows in the pen stable to give them more comfort. We would like to emphasize the fact that we have less digestive and respiratory upsets with our pen stabled cows."

And here are some more ideas from the Knapps: "In summer our cows prefer to spend much time in the barn away from the heat; and in the winter they spend much time sunning themselves in the barnyard. We feel that a well drained and paved barnyard are musts for a pen stable unit.

"If we were to replace any of our units, we would work out a pen stable plan for them. Any good dairyman would be satisfied with units up to 30 cows. With between 30 and 40 cows I don't believe there would be much difference in results comparing pen stables and conventional barns. With more than 40 cows one might begin to have to crowd his cows and find more timid animals which would not produce too well. We feel that we can keep a closer check on heat periods in our pen stable."

Other Opinions

The men reporting here have had good results with loafing pens but we know of some who have given them up after a trial. Mature herds, used to stalls and stanchions, sometimes have difficulty making the adjustment when turned loose in a pen. Pen stabling has been proven good enough in our opinion that it is well worth a trial if you are going to remodel a barn or are setting up a new unit.

A man with a light, clean, well ventilated barn equipped with proper size, well-bedded stalls, still has a good investment. Results with a herd still depend more on the man than on the type of housing.

PASTURES

Pasture soils of the Northeast are quite generally in need of lime and fertilizer, according to pasture specialists of the Regional Pasture Laboratory, State College, Pennsylvania. They point out that surface applications of lime and phosphate move into the soil very slowly, thus with little loss from leaching. Enough phosphate to last two or three years can readily be made in one initial application. Although phosphate is more generally deficient than potash, the use of potash is important on soils where the supply is low.

Legumes are particularly sensitive to a deficiency of potash. However, with heavy potash fertilization, both grasses and legumes may use more than required for maximum production. It is believed, therefore, that potash where required should be applied more frequently than phosphorus.

Pinkney Farm's Pincus, a Saanen goat that in her second lactation period produced 1780 pounds of milk. She is bred and owned by Dr. and Mrs. C. P. Horton of Carmel, N. Y.

In commenting on goats Mrs. Horton says that 7 does can be kept at the same cost as one cow, and that 3 good Saanen goats will keep an average family in milk the year round.

"Best Milk Replacement for Calves I have Ever Fed"

says H. C. Lind,
Wauseon, Ohio

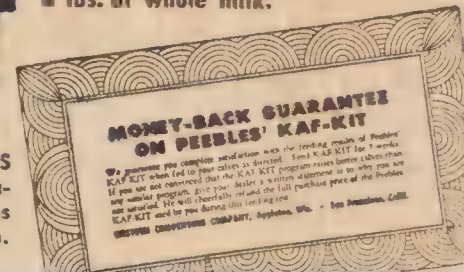

"After using other calf feeds, I quit and was using whole milk. Then I tried Peebles' KAF-KIT. The calves became as nice and slick as when on cows. Calves now being fed KAF-KIT are costing me less than half as much as those I formerly raised on whole milk. They are boned up just as big and have a better structure, with not as much fat. Peebles' KAF-KIT is the best stuff I ever fed!"

Raise "Milk-fed" Calves without Milk. You, too, can save up to 250-500 lbs. of milk per calf by raising your calves on KAF-KIT. You can replace milk safely with KAF-KIT, because it's made of milk — 98% milk serum solids, including milk minerals, milk sugar and milk protein — the most valuable protein known for raising calves. And it's fortified with guaranteed available amounts of Vitamins A, D and Riboflavin. Try KAF-KIT. You, too, can raise better calves at less cost than ever before!

Peebles'
KAF-KIT
(Pronounced CALF-KIT)

98% MILK SERUM SOLIDS plus guaranteed available amounts of Vitamins A, D, and Riboflavin.

One lb. of KAF-KIT replaces
11 lbs. of whole milk.

WESTERN CONDENSING COMPANY

World's largest producer of whey products
Appleton, Wis. San Francisco, Calif.

KLEEN-EZEY means SAFETY plus ECONOMY!

SAFETY—

- For safeguarding the quality of your milk.
- For equipment—No injury to metal, plastic or rubber.
- For your hands—Used according to directions, KLEEN-EZEY will not injure the skin.

ECONOMY—

- A little goes a long, long way. Cut your costs. One solution does all three:
Cleans
Sanitizes
Deodorizes

Use KLEEN-EZEY—

It will pay in higher quality milk.

"I got hold of a quart of your KLEEN-EZEY Formula N-8—and gee, it's grand! Please send me —"
Farmer —, Bettendorf, Ia."

40' x 100' Timberib 40 used for implement storage on Oregon farm. Total erection time after foundation was 180 man-hours.

Timberib 40
...the completely packaged building for economical farm use...

You get more usable space at less cost per foot of floor and storage space with Timberib 40 than with other types of construction. Here's why —

- Low cost to buy, low cost to erect, low cost to maintain.
- No posts, supports or braces — only fully usable space.
- Weather proof, rust proof. Requires no painting.
- Four times as strong as nailed rafters, will last a lifetime.

Timberib 40 package includes metal cover, sheathing, framing, metal windows, doors, louvers, hardware and nails.

If you are contemplating a cattle barn, granary, loafing shed, milking parlor, implement shed or utility building, ask us for complete information on the Timberib 40. No obligation.

Use

SULMET*

SULFAMETHAZINE

Poultry Drinking Water SOLUTION 12.5%

Lederle

■ This time-tested product saves poultrymen millions of dollars annually by effectively controlling outbreaks of coccidiosis, acute fowl cholera, pullorum disease in baby chicks, and coryza.

Sick birds will drink water containing SULMET SOLUTION 12.5% even though off feed... proper dosing of each bird is assured by uniform distribution of the drug in water... work of mixing SULMET in feed or of dosing individual birds is avoided.

Gives protection against losses by death and stunting in outbreaks of cecal and intestinal coccidiosis... infected birds become immune.

Reduces death losses in outbreaks of pullorum disease in baby chicks; of acute fowl cholera in chickens, turkeys and ducks; of coccidiosis in turkeys; in outbreaks of coryza (cold) in chickens. Rapid, highly effective control is obtained.

Read carefully the circular enclosed in the package for *best results* in the use of this product. Prompt treatment after accurate diagnosis is a key to best results. It is advisable to obtain a *laboratory* diagnosis, *especially in intestinal coccidiosis, coryza, pullorum disease and fowl cholera*. Do not hatch eggs laid by hens during medication with sulfas, or for five days thereafter.

We will gladly send upon request a *new edition* of "Control of Poultry Diseases."

Raising Pullets for Next Fall's Layers

By H. L. Cosline

WHETHER you buy or raise pullets, the cost of them will have an important effect on the amount of money you make. Certainly there is one advantage in buying pullets. You know exactly how much they cost, while the man who knows exactly what it costs to raise pullets is the exception. But there are certain disadvantages in buying, an important one being that it is difficult to know the exact quality of the pullets offered you for sale.

A good many poultrymen who buy pullets make it a firm rule never to buy pullets "sight unseen." Naturally, the more you know about the man who raises them, the kind of parent stock and the conditions under which they are raised, the more certain you will be that you are getting your money's worth.

If you do plan to buy, don't wait too long before you make a deal or you may not be able to find the pullets you want when you want them. Most poultrymen will continue to raise their own pullets. The cost of these pullets is not the only point on which the poultryman focuses his attention, but fortunately, to some extent at least, the things which increase costs also may decrease quality. The outstanding example, of course, is disease losses.

The Chicks to Buy

For most men the raising of pullets starts with the buying of baby chicks. It is always dangerous to set down hard and fast rules but we are going to take the risks and say "Do not try to cut production costs by saving a few cents on the cost of each chick." On the contrary, locate the hatcheryman who, in your opinion, has the best chicks in terms of vigor, health and inherited egg production and pay what the man asks.

Let's assume for the moment that you will raise these chicks successfully up to the time they are ready to go on range and discuss some of the questions you will meet at that time.

Pullet Pastures

If you provide growing pullets with real pasture (by that we mean ground that is heavily fertilized and which is growing a mixture of grass and clover—or perhaps a pure stand of ladino—which will approach your idea of a lawn) you can thereby save money in two ways. First, the pullets will eat an amazing amount of this grass and, therefore, eat less mash; second, because of the abundance of vitamins in the grass you can feed them a mash which will cost you less money.

In addition to fertilizing the poultry pasture heavily you will need to clip it two or three times in order to keep the growth around two inches in height. You will also want to watch to see that your growing pullets are spreading over the entire area provided rather than sticking close to their range shelters. Otherwise the ground around the shelters will be bare and the grass at a distance too old and woody to be palatable to pullets.

There are several things you can do; you can move the shelters from time to time; you can clip the grass to keep it young; and you can spread your feeders and waterers over the entire area.

Providing Shade

You will need at least an acre of good poultry pasture for each 500 pullets. You will also need shade. These days, the most common way to provide shade is by open-sided range shelters. An orchard is definitely not a good

place for raising pullets because pullets pick up garden slugs which are an intermediary host for worms. Some poultrymen like an area of growing corn or sunflowers into which the pullets can range.

Another way to lower the cost of production is to cut down on death losses. As already suggested, the first step to take is to buy vigorous chicks. Throughout the summer, both in the brooder house and on the range, your pullets will need room. Crowding slows down growth; results in slow feathering, and often brings on cannibalism. Furthermore, crowding (particularly in the brooder house) may result in smothering, or chicks may get overheated which often brings digestive disturbances.

Protection

You will find it essential that pullets be shut in at night. I mentioned open-sided range shelters. These are open to the breeze but through use of wire are closed at night to keep out foxes, owls, etc.

Many poultrymen are using electric fences around the range to keep out foxes. This works if the grass is kept away from the fence, generally by the use of old crank case oil.

There are many diseases which can bring heavy losses to your flock. In areas where chickenpox is common, most poultrymen vaccinate between the ages of 8 and 12 weeks. This is a disease which may not cause heavy death losses, but it does certainly cause a reduction in eggs. Any detailed discussion of poultry diseases would take too

ENGINEER POULTRYMAN

—Photo: E. Gilman

Up on Cotton Mountain near Wolfeboro, which calls itself the nation's oldest summer resort, is the highest poultry farm in New Hampshire. At least no other has come along to challenge its 1,100 feet elevation. The farm is owned and run by Robert F. Thurrell, shown here with one of his ranging pullets. He had a college degree in electrical engineering back in 1922 when he started raising New Hampshires.

Last fall Mr. Thurrell finished a new 15,000-bird henhouse which raised his total flock to 25,000. Each of the new three-decker building's six pens is 48 by 138-feet and holds 2,500 birds served by automatic feeders. By several economies, such as using lumber cut from his own mountainside, Mr. Thurrell kept construction cost down to less than \$2 a bird.

Green Grass To Red Meat

(Continued from Page 1)

farmers do follow some crop rotation and there is plenty of livestock which eat alfalfa and wastes such as beet tops, lettuce trimmings, and beet pulp from a sugar factory.

The Imperial Valley is below sea level and it was slightly startling to see on the concrete tower of the beet factory a mark which I would judge was 60 feet up, labeled "sea level." The water for irrigation comes from the Colorado River.

Drainage water in the Imperial Valley never gets to the Pacific Ocean. It evaporates. If you will look carefully at a good map of the western states you will find numerous rivers which come to an abrupt end. The water just disappears into the desert and never reappears. In one area we were told that an open tank of water would evaporate at the rate of 90 inches a year.

Sheep Eat Snow

At Wendover in western Utah we visited sheep grazing on government range in early March. There I learned that sheep on winter pasture usually get no water but depend on snow for moisture. Beef cattle cannot do this.
